1. user (2026-06-07T08:14:39.037Z)

You are a tough evaluator of how DEBUGGABLE an observability report is for a README-only reader.
Scenario: indexer_validation_failed (tool: indexer)
GROUND TRUTH (what actually went wrong): Indexing was halted because a validation check failed: the blur/focus check (video too blurry / sharpness below the min threshold). Fix the footage quality or lower validation.min_blur_threshold in config.json, then re-run.
The report is expected to point the reader toward FAQ: "Q13".

THE FRESH READER ANSWERED:
- diagnosis: The blur validation check failed because the video's average frame Laplacian variance (sharpness metric) measured as 0.0, well below the configured threshold of 20.0. A Laplacian value of 0.0 indicates either completely undecodable frames or corrupted frame data in the video file, even though the container metadata (duration, resolution, fps) are readable by FFprobe.
- fix: First, verify the video file is not corrupted by playing it in a media player. If it plays but still fails the blur check, re-encode it to a fresh MP4 file using: ffmpeg -i /videos/match.mp4 -c:v h264 -c:a aac output.mp4. This fixes most container/frame-data issues. Only as a last resort should you lower validation.min_blur_threshold in config.json, which masks the underlying corruption.
- faq_section used: README#Q13 (cited directly in the report's findings block) ? "A validation check failed and indexing was halted ? what do I do?" ? which lists common validation failures and remediation strategies, though it does not specifically detail blur failure solutions.
- could_self_debug: true
- confusing_parts: ["The report lists _config_default_: wasb_hybrid, which is not a valid segmenter in the README (only yolo_hybrid, gemini, motion exist) ? this creates doubt about whether the report is trustworthy or up-to-date.","A Laplacian value of 0.0 is catastrophic and not tunable like resolution/fps, but the report treats it as just another threshold violation without emphasizing the severity or pointing to frame corruption as the root cause.","Q13 says 'fix the underlying cause' but does not give specific steps for blur failures ? re-encoding the video is the real remedy, but is not mentioned in the FAQ."]

Also read the actual report for context:
C:\Users\avidu\AppData\Local\Temp\obseval\reports\indexer_validation_failed.report.md

Judge strictly: did the reader land on the correct ROOT CAUSE (cause_correct)? Did they find/consult the expected FAQ (faq_correct)? How large is the remaining gap (none/minor/major)? Then propose ONE concrete, specific refinement to the REPORT wording, the spec rule message, or the FAQ that would have made this scenario unambiguous to self-debug ? or "none" if it is already excellent. Don't be generous; if anything was confusing, propose a fix.

2. assistant (2026-06-07T08:14:41.703Z)

I'll read the actual report to compare against the reader's answer and ground truth.

# Badminton Highlight Indexer ? Video Report

## Run

| Field | Value |
| --- | --- |
| Tool | badminton-highlight-indexer |
| Video id | md5c (file_md5) |
| Video path | /videos/match.mp4 |
| Generated | 2026-06-07T08:10:50Z |
| Schema | 1.0 |

## Video

| Field | Value |
| --- | --- |
| Duration | 11m16s |
| Resolution | 1920x1080 |
| FPS | 59.94 fps (probed) |
| Container | mov,mp4,m4a |

## Processing stages

**validation** ? `error` (0.0s)
  - checks_passed: 2
  - checks_total: 3
  - FAILED blur_check: Focus check failed. Average sharpness 0.0 below threshold 20.0.

**segmentation** ? `not_run` (0.0s)
  - candidate_windows: 0
  - segment_count: 0
  - total_play_s: 0 s
  - _segmenter_requested_: None
  - _segmenter_actual_: None
  - _config_default_: wasb_hybrid
  - _segmenter_explicitly_requested_: False
  - _matches_config_default_: True
  - _was_reingest_: False
  - _detector_: None

**ai_handoff** ? `not_run` (0.0s)
  - _ai_based_: False
  - _provider_: None
  - _model_: None
  - _api_key_present_: None

## Findings & warnings

- [ERROR] **validation_failed** ? One or more validation checks failed, so indexing was halted. See the Processing stages > validation block above: each failed check states the reason (relevance -> README#Q2, fps/keyframes -> README#Q5).
  ? see **README#Q13**
  ? evidence: stages.validation.status=error

## Verdict

**FAIL**

```

4. assistant (2026-06-07T08:14:55.722Z)

Now I have the full picture. Let me analyze against ground truth.

Ground truth: Blur/focus validation check failed (sharpness below min threshold). Fix: improve footage quality or lower `validation.min_blur_threshold` in config.json, then re-run.

Expected FAQ: Q13.

Reader's diagnosis: Correctly identified the blur validation check failed because sharpness (Laplacian variance) measured 0.0, below threshold 20.0. The report literally states this on line 27: "FAILED blur_check: Focus check failed. Average sharpness 0.0 below threshold 20.0."

Reader's fix: Re-encode the video, and "only as a last resort" lower `validation.min_blur_threshold`. The ground-truth fix is "fix footage quality OR lower threshold" ? the reader's fix covers both, though it reorders priority and adds a speculative re-encoding step.

FAQ: Reader cited README#Q13, which is exactly what the report points to (line 49). Correct.

Now let me assess the gap and the confusing parts the reader raised.

The reader landed on the correct root cause and the correct FAQ. The remaining gap is **minor**:

1. The reader over-interpreted "0.0" as "frame corruption" and built a re-encoding remedy that the ground truth never mentions. The ground truth treats it as a tunable threshold violation (fix footage OR lower threshold). The reader's speculation that 0.0 means corruption is plausible but unverified ? and the report gives no guidance to disambiguate, so this is a real gap the report created.

2. The reader flagged `_config_default_: wasb_hybrid` as a trust-damaging inconsistency (the README only documents yolo_hybrid/gemini/motion). This is a genuine report defect that undermines confidence, even though it didn't change the diagnosis.

3. Q13 is generic ? it says "fix the underlying cause" but gives no blur-specific remediation, so the reader couldn't confirm whether re-encode vs. lower-threshold was correct.

The single most valuable refinement is to make the blur failure message itself self-remediating, since that one line carries the whole diagnosis and currently doesn't name the config knob or the footage-quality option. That eliminates the reader's ambiguity about what to do (and the temptation to invent a re-encode remedy).

5. user (2026-06-07T08:15:04.069Z)

Structured output provided successfully

6. assistant (2026-06-07T08:15:10.780Z)

Done. The reader correctly diagnosed the root cause (blur/focus validation failure, sharpness 0.0 below threshold 20.0) and consulted the expected FAQ (README#Q13). Gap is minor: the report's terse failure line let the reader over-extend the fix toward speculative re-encoding while demoting the actual ground-truth remedy (lowering `validation.min_blur_threshold`), and a genuine report defect (`_config_default_: wasb_hybrid`, an undocumented segmenter) eroded trust. My refinement makes the blur failure line self-remediating by naming the config knob and both remedies inline.
