Transcript

1. user (2026-06-22T18:49:26.605Z)

Engine repo at C:/Users/avidu/Projects/bhi-computeval, docs/ directory. Survey existing docs to decide WHERE this user guide should live and whether to UPDATE an existing doc or CREATE a new one: is there a QUICKSTART / USER_GUIDE / getting-started / README that already covers install+usage for END USERS (not developers)? Read docs/README.md (the index) + docs/CODE_MAP.md headers + any user-facing doc. Return: a recommended filename + path for the new guide (e.g. docs/CREATING_REELS.md or docs/USER_GUIDE.md), whether any existing doc should be updated/linked instead, and how docs/README.md indexes docs (so the new one is added consistently). Report only VERIFIED facts with file:line citations ? this doc must reflect SHIPPED state, never aspiration. If something is NOT implemented, say so.

2. assistant (2026-06-22T18:49:29.341Z)

I'll survey the engine repo's docs to make this recommendation. Let me start by pulling the repo fresh and reading the key index files.

3. user (2026-06-22T18:49:33.339Z)

Your configuration specifies to merge with the ref 'refs/heads/feat/compute-provenance' from the remote, but no such ref was fetched.
---STATUS---
?? cloudbuild.cr.yaml
---HEAD---
ee6fba8 feat(serving): forward skip_ai_handoff to the cloud job so the picker's cloud path yields rallies
4b6a560 feat(serving): compute-path provenance ? prove which backend ran the DETECT
8bcf6ce feat(api): make /api/compile async (202 + poll) to kill the slow-stitch 524 (#329) (#339)

4. user (2026-06-22T18:49:33.431Z)

No files found

5. assistant (2026-06-22T18:49:37.359Z)

The pull failed because the local checkout is on a feature branch `feat/compute-provenance` whose remote ref isn't fetched. I'll proceed read-only on what's local (flagging staleness) and read the index docs.

6. user (2026-06-22T18:49:38.695Z)

7. assistant (2026-06-22T18:49:41.557Z)

The repo at `bhi-computeval` exists with a full docs directory. Let me read the index (README.md), CODE_MAP.md headers, and scan for any existing user-facing guide.

8. user (2026-06-22T18:49:42.038Z)

1 - RALLY_QUALITY_RESEARCH.md ? **Foundation doc** for closing the local-vs-Gemini rally-detection gap: the measured gap + the code-grounded over-merge diagnosis ("shuttle moving ? rally"), an inventory of the eval/experiment harness + its gaps, the strengthened evaluation framework (segmental Edit/F1@k that make over-segmentation first-class, golden-corpus + active learning, Gemini-agreement as a **shadow** signal), an **adversarially-verified, cited external-research synthesis** (TAL/TAS boundary heads, racket-sports rally-state cues, small-data, eval rigor), a **prioritized cheap?durable roadmap** with falsifiable success criteria, and (\$7) a **tracked project plan** ? work-item checklist, sequencing, the single quality **number** attributed to the effort, and a **definition of done**

(project completes when all tiers land + the number is recorded). The plan that the QUALITY_ITERATIONS.md log executes against; ties together EXPERIMENT_HARNESS / MULTI_SIGNAL_FUSION_PLAN / ANALYZERS_AND_RECONCILERS / OWNED_MODEL_IMPLEMENTATION_PLAN.

2 - RALLY_DETECTION_GAP_CLOSURE.md ? ****Tracked execution doc (2026-06-18)**** for closing the remaining rally-detection accuracy gap ****per video, before launch****, driven by the growing golden corpus. First ground-truth clip (GX010141) reframed it: boundaries are tight (R2/R3/R4 holds) ? the gap is ****detection****: (G1) recall (local & Gemini both miss ~half on hard clips, and ***different* rallies ? complementary**), (G2) precision (local over-fires), (G3) ****rally-END over-extension on the quick-return-after-point**** (shuttle still moving ? needs a ***player-state*** signal). Levers (owner-gated): player-kinematics + shuttle-in-hand / sustained-invisibility end-rule with reverse-timeline backtrack, **`rally\_gate`** Gate A wiring, complementary fusion. ****Peer**** of **`RALLY\_QUALITY\_RESEARCH.md`** (execution tracker, not research); §7 is the source of truth.

3 - PROMINENT_COURT_DETECTION.md ? ****Design + experiment (2026-06-19, default-OFF, owner-gated flip)**** for the ****multicourt G2 over-fire****: identify the ****prominent (foreground) court**** (the one covering the majority of the frame) and keep only rallies whose shuttle lives inside it ? re-defining the shuttle signal **`(x,y,visible)`** ? **`(x,y,visible-AND-inside-prominent-court)`** ***before*** windowing, so a background/adjacent-court shuttle never forms a rally. 2D floor polygon (MVP) ? ****pseudo-3D play-volume**** (refinement, so high clears aren't clipped). Born from the GX010142 rally-#1 background-court FP; reuses **`fusion\_features.point\_in\_polygon`** + **`FusionConfig.court\_polygon`**. §8 progress tracker is the source of truth.

4 - RALLY_DETECTION_QUALITY_REPORT.md ? ****Technical-paper checkpoint (2026-06-17)**** of rally-detection quality: the honest measured state (over-segmentation milestone tolerance-F1 0.09170.323 at n=11, p=0.002; merge-rate 0.69470.150; first real-footage ground-truth at-par with START at Gemini parity), the task-faithful R2 metric, a detailed Gemini comparison, next steps + expected wins, areas yet to be explored, and a publishability / path-to-submission verdict. Renders to a polished PDF; the externally-shareable "toward a paper" summary of **`RALLY\_QUALITY\_RESEARCH.md`** + **`QUALITY\_ITERATIONS.md`**.

5 - EVALUATION.md ? How we measure and improve quality.

6 - EXPERIMENT_HARNESS.md ? Design (P1 SHIPPED) for A/B + shadow + SxS experimentation on rally-detection variants with ****zero production regression**** ? experiments are decoupled from deploy (new cues default OFF, promote only on measured LOVO lift, rollback = flip a flag). Composes the existing **`backend/eval/`** machinery (**`calibration`**, **`regression`**, **`metrics`**); implemented in **`backend/eval/experiment.py`**.

7 - QUALITY_ITERATIONS.md ? ****Living log**** of rally-detection quality iterations (hypothesis ? what shipped ? measured/expected effect ? lesson). The reverse-chronological record; terminal-state snapshots get archived under **`archives/quality-iterations/`**.

8 - ANALYZERS_AND_RECONCILERS.md ? Design (owner-gated, NOT started): a ****signal-fusion framework**** for rally detection ? producers emit confidence-scored ****signals**** at three temporal ****scopes**** (frame detectors / window analyzers / session analyzers), a learned ****scorer**** weights them, and an auditable ****report-first reconciliation**** pass lints the decision against the evidence. The spine: ****no special-casing in the decision path**** (signals?scorer, never **`if/else`**). Worked examples: a service-fault analyzer, a warm-up/practice span detector, and consuming a per-frame shuttle-state detector. A peer to **`EXPERIMENT\_HARNESS.md`** and **`MULTI\_SIGNAL\_FUSION\_PLAN.md`** (ADR-007 modular rally layer).

9 - PERSONALIZATION_PLAN.md ? Design (owner-adopted ****hybrid****; Phase-0 landing) for the ****per-user personalization feature on a generalization-first baseline****: a thin per-user ***tuning*** layer gated by the honest small-N statistics (a ****min-N promotion floor**** + a ****structural-guard exemption****, never a service gate) + a ****contribution flywheel**** (free-tier videos pool into the owner-trained baseline; ****a tool that gets better the more you help it****). Records the ****locked owner decisions**** (identity, storage, **`min\_n`** semantics, Gate-A default, free-tier pooling). Built so far: per-user promotion gate (#141) + held-out-USER learning curve (#142).

10

11 - GOLDEN_REGRESSION_FIXTURES.md ? ****Design (owner-gated, NOT started)****: ****video-free, non-attributable regression fixtures so a clean clone runs the rally-seg suite with **no video/GPU/DB****. Two layers ? the post-detector freeze + ****dual gates**** (characterization + quality-floor) reusing the **`backend/eval/`** stack, and the ****SEALED-FIXTURES**** privacy filter (de-attribution-at-source, tiered public/key-gated, shuttle-only public tier). Carries a cited ****IN/US/EU legal memo**** (derived-data IP/privacy), a threat model, and a ****§7 progress tracker + definition-of-done****. Extends [GOLDEN_DATA_SHARING.md](data_pipeline/GOLDEN_DATA_SHARING.md).

12

13 ## ? Documentation status & governance

14 - DOC_STATUS.md ? **? living Documentation Status & Archival Register**: every foundational/tracked doc's lifecycle + archive-readiness, the **archival due-diligence checklist** (*honestly update ? then archive*), and the open doc-hygiene findings. Review here; update rows as docs complete.

15

16 ## Product / platform plans

17 - [COMPUTE_DECOUPLED_SERVING/](COMPUTE_DECOUPLED_SERVING/README.md) ? **? Active tracked project (2026-06-21, `DRAFT` owner-gated):** the productionization successor to DECOUPLED_COMPUTE (its deferred M3/M4). **One pure core (DETECT?WINDOW?STITCH) that never branches on deployment profile**, with a `ComputeBackend` (where it runs) + `StorageBackend` (what bytes) selected by **one startup config**. Ships **truly-local** (local/USB + local GPU, in-process stitch, zero cloud) + **cloud-serving** (upload<2GB / gdrive / bucket ? a **Cloud Run GPU job runs detect AND stitch**, metered into a per-job cost ledger) + **cpu-mock** (CI). Includes [TESTING_STRATEGY.md](COMPUTE_DECOUPLED_SERVING/TESTING_STRATEGY.md) (profile-PARITY proof for \$0), [architecture.svg](COMPUTE_DECOUPLED_SERVING/architecture.svg), a [runlogs/](COMPUTE_DECOUPLED_SERVING/runlogs/) posterity dir, and **ADR-014** ([lineage ADR-009?010?011?012?013?014](archives/decisions/DECISIONS.md)). \$7 M0?M10 tracker is the source of truth.

18 - [DECOUPLED_COMPUTE/](archives/past_projects/DECOUPLED_COMPUTE/README.md) ? ? **DELIVERED + ARCHIVED (2026-06-21).** Lifted the rally pipeline onto a **rented cloud-native GPU** doing bucket-driven `train` + `infer`: storage/compute seams (PRs #246?#259) + the **M3.5 native WASB runner**; **M0?M2 + M3.5 proven on a GCP L4** (M2 ? `weights/0.1.0-l4/`). Delivered on **GCP** ? DigitalOcean dropped for compute ([ADR-013](archives/decisions/DECISIONS.md)). **M3/M4 (serving endpoint + per-video billing + scale-to-zero) deferred ? the "Cloud Run + GPU serving" subproject** ([ADR-012](archives/decisions/DECISIONS.md)). Snapshot under `docs/archives/past\_projects/DECOUPLED\_COMPUTE/` (incl. `DEPLOY\_REPORT\_GCP\_2026-06-20.md`).

19 - PACKAGING_PLAN.md ? **? Active tracked project (`IN PROGRESS`, 11 PRs merged 2026-06-21/22):** ship the engine as a **downloadable batteries-included Python app** ? `pip install` ? `indexer --app` boots a local webserver and opens the **bundled KhelSutra SPA** single-origin, **torch-free** (LIGHT tier), cross-platform, no native component (decision D10/01). Built ON the decoupled-compute seam. **Supersedes the `DESKTOP\_APP\_PLAN.md` narrative.** \$7 tracker = source of truth (P0a?e ?, P1a/b ?, P2-launcher/P2a/P2d/P2e ?). **? Next:** P3 GPU validation + screencast ? P2b-install ? P2c wizard (cross-repo) ? P4 (ONNX/train/annotate = north star). Memory `[packaging-app-plan]` / `[next-session-packaging-app]`.

20 - DESKTOP_APP_PLAN.md ? **? Superseded narrative (by `PACKAGING\_PLAN.md`; D10 = self-hosted webserver, NOT a desktop app).** Original scoping doc (2026-06-18, `[design]`): package the local pipeline as a **cross-platform desktop app** for non-technical players ? plug in the camera's USB/SD card, click once, get back **only the highlight reels**, fully on-device (no upload, no original-video bloat). The centerpiece is the **de-WSL native-compute port** (run WASB natively per-OS: Linux/Windows CUDA · macOS MPS/CPU ? drop WSL2), and its **make-or-break unknown**: is CPU acceptable on a typical *no-GPU* enthusiast laptop (WASB is ~3.4x real-time on a laptop 2070S)? \$7 tracker = **P0 compute-feasibility spike ? P1 native detector ? P2 app shell ? P3 packaging/installers**. Realizes the **L0 fully-local** tier of VIDEO_LOCALITY_MODEL.md; is the **`LocalDesktop` ComputeBackend** of PLATFORM_ARCHITECTURE.md §3.2; the smaller/export-clean owned model (OWNED_MODEL_IMPLEMENTATION_PLAN.md) is one answer to the compute crux.

21

22 ## Practical / ongoing

23 - SETUP_NEW_MACHINE.md ? **? The canonical "spin up a box ? ready for training & inference" runbook. Copy-pasteable, human-followable, **verified end-to-end on DigitalOcean (2026-06-20)** ? but **compute is now GCP-only (ADR-013)**, see [`deploy/gcp/README.md`](../deploy/gcp/README.md): credentials ? provision ? bootstrap ? suite (922 passed) ? secret-free CPU inference (no GPU/keys) ? real Gemini inference ? Gen-0 training, with pointers to the GPU/native-detector + bucket paths. The `deploy/digitalocean/\*` scripts are provider-agnostic and reused on GCP.

24 - DATA_IN_GCS.md ? **? The corpus source-of-truth map: where every piece of data lives in `gs://khelsutra-rally-corpus`** (canonical layout · current contents + drift · how `backend.worker` consumes it · the still-local-only **gap** · migration plan). Read this so a session pulls data from the bucket, not from someone's `C:`/`F:`/Drive ? the goal is to remove the local box as a blocker. Pairs with the two runbooks below.

```

25      -
[deploy/gcp/nightly_regression/README.md](../deploy/gcp/nightly_regression/README.md) ? ??
Nightly engine-regression OPERATIONS MANUAL (one-stop shop): enable · run on demand · change
any setting (email recipients/frequency/clips/config) · observe · pause/disable/remove. The full
WASB-pipeline reel-count+cost+email nightly on an ephemeral GCP GPU VM (design/status:
[NIGHTLY_ENGINE_REGRESSION.md](NIGHTLY_ENGINE_REGRESSION.md)). The lighter CPU cached-
trajectory tripwire is `scripts/nightly_regression.py` (local Windows Scheduled Task, PR #202).
26      - [TRACKNET_WSL_SETUP.md](TRACKNET_WSL_SETUP.md)
27      - Evaluation harness and calibration drivers (in `backend/eval/`)
28
29      ## Data layer (collection · annotation · golden sets ? no ML)
30      - [data_pipeline/](data_pipeline/README.md) ? the isolated data pillar: how
footage is recorded (`VIDEO_RECORDING_GUIDELINES`), golden sets are created + which videos
(`GOLDEN_SET_IMPLEMENTATION` · `GOLDEN_SET_PHASE1_VIDEOS` · `GOLDEN_VIDEOS`), and data is
shared/ingested (`GOLDEN_DATA_SHARING`). Deliberately no segmentation/stitching/model detail
? that's the ML pillar (top level + `COMPUTE_DECOUPLED_SERVING/`). The annotation-vendor
(Roora) engagement is archived under `archives/roora-vendor/`.
31
32      ## Conventions & templates
33      - [PROJECT_DOC_TEMPLATE.md](PROJECT_DOC_TEMPLATE.md) ? Reusable skeleton for a tracked
project doc: status header · decisions-locked · progress tracker (???) · definition-of-done
· archived on completion. Standardizes the emergent pattern in `RALLY_QUALITY_RESEARCH.md` §7
and `GOLDEN_REGRESSION_FIXTURES.md`. Use for any substantial design/project work.
34
35      ## Historical documents
36      Completed plans, old research, ADRs, and checkpoints live in [archives/](archives/).
37
38      - [CODE_AUDIT_AND_TEST_HARDENING.md](CODE_AUDIT_AND_TEST_HARDENING.md) ? COMPLETED
(2026-06-14; T1?T5 + full loop + verification per #162). Living record of the June 2026 plumbing
/ contract / architectural audit, 626-test infrastructure, positive test plans for the 5
identified issues, multi-layer regression protocol (including ablation/experiment layer), and
pre/post-change verification checklist. See `docs/archives/CODE_AUDIT_AND_TEST_HARDENING-
COMPLETED-2026-06-14.md` and `docs/archives/checkpoints/2026-06-14-hardening-loop-complete.md`
for the final archived state. (Top-level is now pointer stub per review; full content in
archives/.)
39
40      - Field-ops / customer-feedback (recruiting flyer · field-visit playbook · PMF) ?
[archives/field-pmf/](archives/field-pmf/) (archived 2026-06-21; PMF validation still an
active business thread ? see `NEXT_STEPS.md`).
41      - Roora annotation-vendor engagement (labeling brief · vendor bake-off) ?
[archives/roora-vendor/](archives/roora-vendor/) (archived 2026-06-21).
42      - Superseded: per-video output layout ? [archives/PER_VIDEO_OUTPUT_LAYOUT-
SUPERSEDED-2026-06-21.md](archives/PER_VIDEO_OUTPUT_LAYOUT-SUPERSEDED-2026-06-21.md) ( ?
`PER_VIDEO_WORKSPACE.md`).
43
44      See `archives/README.md` for the umbrella policy and `archives/past_projects/README.md`
for classification of small tech debt / starter projects.

1      # Batteries-Included App ? Packaging & Distribution Plan
2
3      > Status: IN PROGRESS ? 01/02 resolved (LIGHT-first; cross-platform webserver, no
native component; WASB-complete north star); 11 PRs merged 2026-06-21/22 (P0a?e, P1a/b,
P2-launcher/P2a/P2d/P2e); 03+ owner/counsel-gated · Owner: Avi Dullu · Created:
2026-06-21 · Last updated: 2026-06-22
4      > Lifecycle: DRAFT ? IN PROGRESS ? DONE ? archived (move to `docs/archives/` when
DONE)
5      > Tracking anchors: §7 progress tracker is the source of truth; indexed in
`docs/README.md` + `docs/NEXT_STEPS.md`; memory `[[packaging-app-plan]]` + `[[next-session-
packaging-app]]`.
6      > Relation to existing docs: supersedes the narrative of
`docs/DESKTOP_APP_PLAN.md` (per locked D10 ? self-hosted webserver, not a desktop app); builds
on docs/COMPUTE_DECOUPLED_SERVING/ (the profile/storage/compute seam) and is the
distribution layer under `kheIsutra/docs/LOCAL_APPLIANCE_ARCHITECTURE.md`.

```

```

7      > **Honesty note:** claims tagged `[verified]` (checked at file:line), `[researched]`
(web/needs sign-off), `[design]` (proposed). Not legal advice ? licensing items need counsel.
8
9      ---
10
11     ## ? NEXT SESSION ? start here
12     **You are here (2026-06-22):** **v1 LIGHT is FEATURE-COMPLETE.** `pip`/`uv` tool install
? `indexer --app` boots torch-free, seeds a truly-local **motion** default (gate 08), and
**serves the 3-step first-run wizard** single-origin (P2c, bundled), with app-home state / env-
overridable ffmpeg / DNS-rebinding-guarded bind / single-instance lock / safe DB upgrades /
clean install+uninstall. **P3 GPU-validated on a real L4 ($0) ? 22 rallies ? 73.7 MB reel.**
Remaining = OWNER clean-box acceptance + ffmpeg-acquisition UX; then the north-star
(P3-cloud/P4). Ramp up via $7 + memory `[packaging-app-plan]`/`[next-session-packaging-
app]`.
13
14     **Remaining work, in priority order (each its own small PR; branch off `origin/master`,
explicit paths ? shared checkout):**
15     1. ? **P3 GPU validation ? DONE (2026-06-22, $0).** Validated the packaged **wheel**
end-to-end on a real L4: torch-free wheel install ? `indexer --app` ? bundled SPA ? native-WASB
(separate `$WASB_PYTHON` conda env) ? **22 rallies ? 73.7 MB watermarked reel**, all via the
REAL API. Proof in `gs://khelsutra-rally-
corpus/highlights/p3_{packaging_highlights.mp4,run.log,app.log}`. VM deleted, $0 (~$0.17, ~14
min). The old "0 rallies" blocker was already solved by `skip_ai_handoff=true`
(`docs/CLOUD_GPU_DRYRUN_GUIDE.md`). Screencast = owner records from the preserved reel/logs.
16     2. ? **P2b-install ? DONE (2026-06-22).** Engine seeds a truly-local + `motion` (gate
**08**) torch-free default config on the first `indexer --app` (never overwrites); cross-
platform `scripts/install.py` (`uv` tool install` else pip) + per-OS launcher shortcut that pins
`RALLY_APP_HOME` + `scripts/uninstall.py` driven by an install manifest (keeps user data unless
`--purge`). See $7.
17     3. ? **P2c first-run wizard ? DONE (2026-06-22).** 3-step wizard (`SetupWizard.tsx`)
from `api/capabilities`, 6 langs, shows once/browser ? khelsutra
**[#88](https://github.com/avidullu/khelsutra/pull/88)**; **re-bundled into `backend/ui/`**
(`scripts/bundle_ui.sh` @ khelsutra@7ae9cee`) so `indexer --app` SERVES it ? engine
**[#312](https://github.com/Khelsutra/badminton-highlight-indexer/pull/312)**. Browser-verified
e2e.
18     4. **? v1 LIGHT is now FEATURE-COMPLETE.** Only OWNER steps remain: a **clean
Windows/macOS/Linux box ? install ? reel** acceptance run ($9 DoD) + the **ffmpeg-acquisition
UX** (still a manual winget/brew/apt dep ? fold a first-run check into the wizard/`doctor.py`).
Then the **north-star** (the SOLE completion goal, L10): **P3-cloud** (Cloud Run dispatch +
micromamba Dockerfile ? P3a) and **P4** (ONNX export ? dissolve the dual-env; native-WASB in the
default download + BYO training + in-app annotation) ? all future + counsel(03)/owner-GPU-gated.
19
20     ---
21
22     ## 0. TL;DR
23     Ship the engine as **ONE pip-installable artifact whose behaviour is selected entirely
by the already-merged decoupled-compute seam** (`deployment.profile` / `compute_target` /
Storage+Compute backends), fronted by a friendly launcher + a Windows installer ? **not** a
frozen monolith, **not** an Electron/Tauri shell. The hard constraint that forces scope: torch
is deliberately out of `pyproject` (needs `--index-url`) **and** native WASB needs a **second,
incompatible* torch env (conda py3.8 + torch 1.11+cu113) shelled out via `$WASB_PYTHON`
`[verified native_wasb_runner.py:89]` ? so no single venv/freeze can deliver the GPU-quality
path. **The honest v1 is a LIGHT tier** (Gemini + motion + cpu-mock, **zero* torch/GPU) that
preserves CUJ-1.5/8; the native-WASB GPU path (CUJ-6/7) ships **owner-only** until two blockers
clear (WASB-C3 weight provenance + a reproducible truly-local config). **LIGHT is the FIRST
shippable increment, not the terminal scope ? the sole completion goal (north star, L10) is the
FULL quality path: native WASB + BYO training + in-app annotation.** Delivery is **cross-
platform (Windows/macOS/Linux): the same local webserver powers the UI on all three, with NO
native component** (L9). **Five small engine prerequisites must land before any packaging push**
($7 P0). The single most actionable finding: **all mutable state is CWD-relative today and
`--setup`/server disagree on `config.json`** ? a silent data-loss footgun that P0 must fix
first.
24
25     ## 1. Problem & goal
26     **Goal:** a non-technical user (the primary persona: an India coach/parent on Windows ?

```

```

`docs/UI_PROPOSAL.md` §2) **downloads and runs** the indexer **without sourcing the repo**. The
app spins up a **local web service** for (a) inference video?rallies?reel, (b) BYO **training**,
and (c) **rally annotation** if needed ? runnable **locally and against cloud services** ? and
**preserves every completed CUJ** (§ CUJ map).
27
28 **Why now:** scaffolding + the decoupled-compute serving seam (M1?M8) are merged and
default-OFF; the SPA + i18n + the dry-run CUJ are done. What's missing is the *distribution*
story: today the only path is `git clone` ? `pip install -e .` ? out-of-band torch ? manual
ffmpeg ? set up the WASB conda env ? build the SPA from a *different repo*. This plan collapses
that into download-and-run.
29
30 **Read to get current:** `pyproject.toml`, `backend/main.py` (`main()` + `--server`),
`backend/config/{loader,presets,models}.py`, `backend/storage/*`, `backend/compute/*`,
`backend/pipeline/detectors/native_wasb_runner.py`, `deploy/cloudrun/Dockerfile`,
`docs/COMPUTE_DECOUPLED_SERVING/README.md`, `khehsutra/web/` +
`khehsutra/docs/LOCAL_APPLIANCE_ARCHITECTURE.md`.
31
32 ## 2. Decisions locked (do not relitigate)
33
34 | # | Decision | Source / date | Implication for packaging |
35 |---|-----|-----|-----|
36 | L1 | **Pure DETECT?WINDOW?STITCH core never branches on profile**; one build, profile-
selected | COMPUTE_DECOUPLED_SERVING D1 | Local vs cloud is **one config flip**, not a fork ?
build ON this, don't reinvent. |
37 | L2 | **Profiles** = truly-local / cloud-serving / cpu-mock via `PROFILE_PRESETS` | M1
#279 `[verified backend/config/presets.py]` | The app exposes a single "where does compute run"
choice. |
38 | L3 | **Compute = GCP only** (Cloud Run GPU Jobs); DigitalOcean dropped | ADR-013,
2026-06-20 | Cloud tier targets Cloud Run + BYO-GPU-VM only. |
39 | L4 | **Edge-auth required before any non-localhost exposure** (Cloudflare Access + in-
app JWT verify) | D9 / M9 `[verified backend/api/auth.py wired default-OFF main.py:294]` | Bind
stays `127.0.0.1` by default; `0.0.0.0` only under an edge-auth profile. |
40 | L5 | **Delivery = self-hosted webserver the user spins up ? NOT a desktop app** | D10,
2026-06-20 (supersedes `DESKTOP_APP_PLAN.md`); **01 confirmed 2026-06-21** | The launcher boots
the server + opens the user's *own browser* at localhost ? that IS the delivery, no embedded
webview. |
41 | L6 | **MIT / Apache-2.0 / BSD only** for every dependency ? code, data, AND weights |
ratified 2026-06-09 | Every *new packaging* dep must clear this (see §3). |
42 | L7 | **Paid LLMs (Gemini) = inference/serving only, never a training data source**;
commercial models trained on paid-LLM labels are ship-blocked | guardrail + `gate_verdict`
`[verified harness.py:177 ship=False]` | The wizard's Gemini-key step must say so; training UI
must surface the ship-gate. |
43 | L8 | **User-switchable profiles** ("your machine or our cloud") with explicit confirm
? cloud spend never silent | D13 / D15 | "Push to cloud" toggle needs confirm + INR estimate
from `backend/billing.py`. |
44 | **L9** | **Cross-platform (Windows + macOS + Linux); NO native component** ? the same
local webserver powers the UI on all three | 01, 2026-06-21 | Distribution = `uv`/pip + a
**pure-Python launcher** (`webbrowser.open`). Reject native-installer-as-runtime,
Electron/Tauri, and LGPL tray libs. OSes differ only in ffmpeg/torch *acquisition*. |
45 | **L10** | **North star = the FULL quality path is the SOLE completion goal** ? LIGHT
is the first increment; DONE requires native WASB + BYO training + in-app annotation | 02,
2026-06-21 | §9 DoD splits "v1 shippable" from "north-star DONE"; P3/P4
(WASB/ONNX/train/annotate) are completion-gating, not optional. |
46
47 ## 3. Foundation ? research / prior art
48
49 **Distribution channels `[researched]` ** ? `uv` is the only channel that can both
install a pinned Python *and* route torch's `--index-url`; `pipx`/plain `pip` can't express the
torch index. Frozen binaries (PyInstaller/Nuitka) with torch+CUDA are 3?5 GB, can't split CUDA
libs, and **cannot host the second WASB env** ? rejected for the GPU path. Prior art (Frigate
NVR ? closest analog: ffmpeg + ML + web + Docker; Ollama; ComfyUI; LM Studio) converges on **two
patterns that fit us: ** (1) a *container image* for the server/GPU profile, (2) a *first-run
download + a friendly launcher** for the local app.
50
51 **Licensing landmines `[verified]` (the load-bearing §3 findings):**

```

```

52     - **WASB-C3 is the dominant blocker.** The WASB-SBDT *code* is MIT, but the badminton
*checkpoint* provenance is **unresolved** for commercial redistribution ? `gate_verdict`
hardcodes `ship=False` `[verified training/gen0/harness.py:174-177]`. **Do not conflate MIT-code
with cleared-weights.** A public download must **not** auto-fetch the weights until counsel
signs off (03).
53     - **ffmpeg is GPL via the `libx264` encoder** `[verified
backend/pipeline/stitcher/compiler.py:253]`. The license-clean path is **not to redistribute
ffmpeg** ? resolve a system/winget install instead. `imageio-ffmpeg` also lacks `ffprobe` (which
the engine needs) `[researched]`.
54     - **Anaconda ToS exposure:** the Cloud Run image uses `Miniconda3` + `conda tos accept` ?
pkgs/main/`\pkgs/r` `[verified deploy/cloudrun/Dockerfile:33-37]` ? the ?200-employee ToS trap.
Replace with **micromamba + conda-forge** (BSD, no ToS) for the cloud image *and* any local
managed WASB env; record an ADR.
55     - **New packaging deps that clear L6 `[researched]`: **`uv` (Apache/MIT), Inno Setup
(permissive), `onnxruntime` (MIT), `micromamba` (BSD-3), Docker/OCI (Apache-2.0), boto3/google-
cloud-* (Apache-2.0), stdlib `webbrowser`. **Forbidden:** `pystray` (LGPL-3.0). **Build-time-
only:** `Nuitka` 4.x is **AGPL-3.0+** (compiled output has a runtime exception) ? usable as a
tool, never bundled. `obsreport` (private git dep) stays a truly-optional extra, never bundled.
56
57     ## 4. Design / architecture
58
59     ### 4.1 One build, profile-selected (the reuse map)
60     - **Reuse:** hatchling build + `indexer = backend.main:main` console script `[verified
pyproject.toml:80-82]`; `PROFILE_PRESETS` `[verified presets.py]`; `get_compute_backend(config)`
returns `CloudRunCompute` only for `compute_target=='cloud_run'` else `None`=in-process
`[verified backend/compute/__init__.py]`; `backend/storage/*` (local/gcs/s3/gdrive); the in-
process `ThreadPoolExecutor(max_workers=1)` job worker `[verified backend/api/job_worker.py]` ?
**server and worker are the same process for serving** `[verified main.py:729-736]`, so a
packaged launcher just runs `indexer --server`.

```

10. assistant (2026-06-22T18:49:47.328Z)

The README index is detailed. I notice it does NOT list a QUICKSTART/USER_GUIDE/getting-started for end users ? the user-facing docs are all developer/runbook (``SETUP_NEW_MACHINE.md`` is a "spin up a box for training/inference" runbook, not an end-user reel-creation guide). Let me verify there's no existing end-user guide and check what CUJs/CLI actually ship. Let me search for candidate names and read the CODE_MAP header plus the SPA/UI proposal.

11. user (2026-06-22T18:49:50.025Z)

```

=== filenames matching user-facing patterns ===
(end of filename grep)

```

12. user (2026-06-22T18:49:51.381Z)

```

Found 5 files

```

13. assistant (2026-06-22T18:49:54.770Z)

No filename matches any user-guide pattern. The content matches are all in strategy/vendoring docs (not end-user guides). Let me confirm by checking what those few hits actually say, and read the CODE_MAP header plus check for a top-level README and the actual shipped CLI/CUJ surface.

14. user (2026-06-22T18:49:55.727Z)

```

1     # CODE_MAP.md
2
3     **Purpose:** cold-start navigation map for the badminton-highlight-indexer ? a self-

```

hosted video ? highlight-reel pipeline (CV/AI rally detection ? SQLite ? ffmpeg stitch) with a segmenter-agnostic eval/calibration stack, typed config, and per-video observability reporting.

4
5 ****Regenerate:**** rerun the `build-code-map` workflow (parallel subsystem readers ? this doc). Re-run after any registry/contract/WSL-interface change, or after a directory restructure (this revision follows #40).

6
7 ? ****2026-06-10 audit-hardening sweep** changed several behaviors documented below ? trust git history over stale lines until the next full regen:****** `add\_video` is now an ****UPSERT**** (no FK-cascade wipe on re-ingest; segmentation is destroy-AFTER-confirm via `segment\_watermarks`/`prune\_segments`); detector artifacts are keyed by ****video_id****, not basename; ****indexing.wasb.**** is now a real typed config****** (was silently dropped); `timeout\_sec` defaults ****1800s**** (was 0/hang-forever); SQLite opens with ****WAL + busy_timeout****; `match\_intervals` requires real overlap (iou>0); `run\_regression` baseline lives in tracked `eval\_baselines/` and ****exits 3 on a missing baseline****; the API validates `video\_path`/`output\_filename`. New tests: `test\_api\_endpoints`, `test\_compiler`, `test\_wasb\_runner`, `test\_reingest\_safety`, `test\_detector\_keying`, `test\_config\_wasb`, `test\_path\_safety`, `test\_reliability\_hardening` (+ collector `test\_licensing\_gate`, `test\_import\_guard`, `test\_cvat\_robustness`).

8
9 ****LEGEND****
10 - `@path` = file (always repo-relative)
11 - `::sym` = symbol (class/func/const) in the nearest preceding `@path`
12 - `->` = dataflow / call / "produces"
13 - `\$` = data contract (canonical shape)
14 - `?` = gotcha / footgun
15 - `?` = registry / plugin extension point
16 - `WSL` = runs inside WSL2 conda env, NOT the Windows Python process

17
18 ---
19
20 **## 0. REPO LAYOUT ?** where new files go (READ BEFORE committing a new file)

21
22 Top-level tree and the ****placement rule**** for each kind of file. When unsure, prefer an existing

23 ****registry / extension point**** (`?`) over a new top-level file.

24
25 | You're adding? | Put it in? | Notes |
26 |---|---|---|
27 | Backend / runtime code | `backend/<subsystem>/` |
`pipeline/{segmenters,detectors,validators}`, `providers/`, `sports/`, `annotations/`,
`infrastructure/`, `reporting/`, `stitcher/`, `utils/`, `config/`, `features/`, `api/`. Most
additions are ****register a class in the relevant `?` registry****, not a new module tree. |
28 | ****Eval LIBRARY**** (importable, pure ? metrics, calibration, a scorer, a feature) |
`backend/eval/` | Pure core, no side-effects at import; CLI/I-O lives in a separate driver.
These are ****imported widely**** (e.g. `calibrate\_wasb` by 8 sites) ? they are library, not
scripts; do NOT move them out. |
29 | ****Standalone run-driver / one-off entry CLI**** (has `\_\_main\_\_`, NOT imported by app
code) | ****`scripts/`**** | e.g. `scripts/run\_phase3\_eval.py`, `scripts/run\_process\_and\_stitch.py`.
Run as `python scripts/<name>.py`. If it needs `load\_dotenv()`/`sys.path` before importing
backend, add `scripts/<name>.py" = ["E402"]` to `ruff.toml`. |

30 | ****Ops / maintenance tool**** (not part of the served app ? cache GC, batch admin) |
`tools/` | Run as `python -m tools.<name>` (it's an importable package). e.g.
`tools/cleanup\_caches.py`. Keep the destructive decision path pure + unit-tested. |
31 | Training code (model fitting) | `training/` | Behind the CI-enforced import wall
(ADR-008) ? `backend.main` must not import it. Own `requirements-train.txt`. |
32 | A test | `tests/test\_\*.py` | pytest auto-discovers; the full-suite lane has a ****70%
coverage floor****. Pure/offline + mocked (no GPU/WSL/network). |

33 | A doc (design, plan, living log) | `docs/` | Index it in `docs/README.md`. Only
****terminal-state**** (DONE/REJECTED) work moves to `docs/archives/`. |

34 | A throwaway repro / debug script | `scratch/` | ****Gitignored**** + excluded from
ruff/pytest. Never imported by app code. |

35 | A model artifact (weights + manifest) | `artifacts/<name>/<ver>/` | ADR-008:
****manifest committed**** (provenance), ****weights gitignored****. |

36 | Eval baseline / leaderboard JSON | `eval\_baselines/` | Tracked (survives a clean

```

checkout); the no-regression gate reads it. |
37 | **Committed regression fixture** (video-free golden) |
`eval_baselines/fixtures/<slug>/` | Tracked, **LF-pinned** (`.gitattributes`). Synthetic Tier-0
(or owner-cleared, de-attributed real). Drives the `golden_fixtures` characterization gate with
**no video/GPU/DB**. See `docs/GOLDEN_REGRESSION_FIXTURES.md`; mint via `python -m
backend.eval.golden_fixtures --freeze-synthetic` / `--freeze-real` (refusal-gated). |
38 | Pipeline run outputs (reels, trajectories, DBs, frames) | `output/` | **Gitignored.**
Per-video isolation is the tracked **`PER_VIDEO_WORKSPACE.md`** project (P0 helper shipped #264;
supersedes the archived `PER_VIDEO_OUTPUT_LAYOUT`). |
39
40 **Canonical files that stay at the repo ROOT** (referenced by CI / packaging / docs ? do
not move):
41 `pyproject.toml` (PEP 621 packaging, hatchling; `indexer` entry point) .
`run_all_tests.py` (CI: `ci.yml`) .
42 `run_regression.py` (the no-regression gate CLI, cited in `EXPERIMENT_HARNESS.md`) .
`run_eval.py`
43 (grandfathered ? imported by `tests/test_eval_harness.py`). The old diagnostic
`setup.py` moved to
44 `scripts/doctor.py` (it shadowed the build system); invoke via `python
scripts/doctor.py` or `indexer --setup`.
45 New standalone run-drivers go in **`scripts/`**, not the root.
46
47 ---
48
49 ## 1. PIPELINE
50

```

15. user (2026-06-22T18:49:57.768Z)

=== repo root README (top 40 lines) ===

Badminton Highlight & Rally Indexer

A local, AI-powered web application and CLI utility designed to process long-form badminton recordings (e.g., from GoPro), run comprehensive pluggable validations (quality, integrity, and relevance checks), index all rallies into a relational SQLite database, and dynamically compile custom highlight reels using high-speed FFmpeg stitching.

The pipeline is built around three pluggable registries ? ****validators****, ****segmenters****, and ****AI providers**** ? plus a ****sport profile**** registry so the same engine can target other racket/court sports in the future. Badminton is the default profile.

> ****Where this is heading:**** the project is evolving from an AI-API-dependent prototype into a self-improving tool that learns rally detection **offline** from a commercially-licensed, annotated corpus. See ****docs/ROADMAP.md**** for the four-phase plan and ****docs/archives/decisions/DECISIONS.md**** (historical ADRs) for the rationale.

? Key Features

- * ****Pluggable Video Validation Framework****: Easily extendable base-class architecture that automatically runs checks on:
 - * ***Static Format & Resolution***: Verifies container is MP4, resolution $\geq 720p$, and framerate ≥ 30 FPS.
 - * ***PTS Timeline Continuity***: Scans keyframe timestamps for timeline gaps, jumps, or editing splices to detect tampering or splices.
 - * ***Scene Cut Density Check***: Measures sub-sampled HSV frame histogram correlation to verify visual cuts. A continuous raw camera stream should have near 0 cuts.
 - * ***Blurriness Check***: Calculates average frame Laplacian variance to reject out-of-focus footage.
 - * ***Relevance (Is it Badminton?)***: Uses high-performance HSV color court matching to identify court layouts.
- * ****Six Pluggable Rally Segmenters**** (`backend/pipeline/segmenters/` ? `motion`, `gemini`,

```
`yolo_hybrid`, `tracknet_hybrid`, `wasb_hybrid`, `fusion_hybrid`). The three core ones:
*   `yolo_hybrid` ? two-stage pipeline. Stage 1 runs torchvision person detection**
(Faster R-CNN, BSD-licensed) with ByteTrack tracking (supervision, MIT-licensed) to cheaply
filter the video down to a small set of high-motion candidate windows. Stage 2 hands each
candidate (with a small padding) to the AI provider for high-precision semantic boundaries and
shot counts. Massively cheaper than running the LLM on the full video. *(The registry key
remains `yolo_hybrid` for back-compat; the AGPL-licensed YOLOv8 was replaced with permissive
components ? see [docs/archives/MONETIZATION_AUDIT.md](docs/archives/MONETIZATION_AUDIT.md) and
ADR-005.)*
*   `gemini` ? sends the entire video (or a `chunk_duration` slice) to Google Gemini
directly. Highest precision per call, highest cost.
*   `motion` ? zero-dependency OpenCV pixel-difference heuristic. No API key required.
Useful as a baseline or for offline/air-gapped use.
*   Pluggable AI Provider Registry (`backend/providers/`): The Gemini provider ships in-
tree; new providers (e.g. an OpenAI or local-model backend) can be registered without touching
the segmenters.
*   Pluggable Sport Profile Registry (`backend/sports/`): The per-sport LLM prompt and
relevance config live in a `SportProfile`. Add a new sport by subclassing `SportProfile` and
registering it.
*   SQLite Indexing: Each processed video is keyed by MD5 hash. Play segments
(start/end/duration/server/receiver/metadata) and per-segment events are persisted in
`output/sports_indexer.db`. Re-running on the same file is a cache hit.
*   Query System: Filter indexed play segments by `server`, `receiver`, `duration_min`, and
`event_type` (the schema supports rich event types like smashes/serves/fouls; today the shipped
segmenters mainly populate timing + estimated `shot_count`).
*   Zero-Dependency Local UI: Served statically directly by FastAPI (Vite + Node.js NOT
required!) featuring a glassmorphic dashboard, responsive filtering, and immediate clip
stitching.
*   High-Speed FFmpeg Stitching with configurable `begin_padding`, `end_padding`, and
`min_shot_count` filtering, plus an optional branding watermark burned into every reel (**on
by default** ? `"Generated by Khelsutra.guru"`, fully configurable, with an off switch).
*   Detailed CLI Debugging Tools: `--debug-clip <t>` inspects frame metrics, validator
scores, and motion values around a timestamp. `--trim-start/--trim-end` extracts an arbitrary
segment via stream-copy ffmpeg for fast iteration.
```

?? Setup & Diagnostics

0. Batteries-included install (LIGHT tier ? recommended for end users)

For a download-and-run experience (no `git clone`, no PyTorch, no GPU), use the cross-platform installer. It installs the **LIGHT tier** (torch-free: Gemini / `motion` / cpu-mock), writes a launcher script (in your app-data folder), and seeds a sensible default config.

```
=== console_scripts / CLI entry ===
1:# PEP 621 packaging for the badminton/sports highlight indexer (DEFERRED #7).
17:name = "badminton-highlight-indexer"
84:[project.scripts]
85:# `indexer --server`, `indexer --help`, etc. -> backend/main.py::main()
86:indexer = "backend.main:main"
```

16. assistant (2026-06-22T18:50:02.920Z)

This is the key finding: the **root README.md** already contains substantial end-user-facing install + usage content ("Setup & Diagnostics", "Batteries-included install (LIGHT tier ? recommended for end users)"). Let me read more of the root README to understand exactly how much end-user usage it covers, and check the UI_PROPOSAL/UI_ALPHA docs since the actual reel-creation flow is the SPA, not the CLI.

17. user (2026-06-22T18:50:05.021Z)

1:# Badminton Highlight & Rally Indexer
11:## ? Key Features
33:## ?? Setup & Diagnostics
35:### 0. Batteries-included install (LIGHT tier ? recommended for end users)
42:# Preferred ? uv installs `indexer` into an isolated tool env:
44:# If `indexer` isn't found afterwards, add uv's tool-bin to PATH once: uv tool update-shell
46:# Or the cross-platform installer script (uv-if-present, else pip) ? also writes a launcher
47:# script (with the resolved `indexer` path baked in) + an uninstall manifest:
67:### 1. External System Requirements
76:### 2. Install the package
82:# Runtime deps only:
84:# Plus test + lint/type tooling (pytest, pytest-cov, httpx, ruff, mypy):
102:### 3. Diagnostics Checker (`scripts/doctor.py`)
107:# or, via the CLI:
120:## ? Running the Application
122:### 1. Launching the Local Web App Dashboard
130:### 2. Running in CLI Processing Mode
144:### 3. Rich CLI Debugging (`--debug-clip`)
151:### 4. Extracting a Trimmed Segment (`--trim-start` / `--trim-end`) ? also the quickest
watermark preview
164:### 5. End-to-End "Process + Stitch" Script
167:### 6. Cache Hygiene & Disk Cleanup
182:## ?? Threshold Tuning (`config.json`)
254:## ? Frequently Asked Questions (FAQ)
256:### Q1: The server complains that `ffprobe` is not found.
259:### Q2: Why does my video fail the Relevance check?
262:### Q3: How do I add a new custom validator to the pipeline?
268:### Q4: Why does the CLI or server output freeze or take a long time on large videos?
275:### Q5: Why did the video fail with "No keyframes / packet timestamps could be extracted"?
278:### Q6: How can I quickly test the indexing without waiting to parse an entire multi-GB
video file?
285:### Q7: How do I configure and run an AI-powered segmenter (Gemini / YOLO-hybrid)?
309:### Q8: How does the `yolo_hybrid` pipeline actually save money?
319:### Q9: How can I debug/test the Gemini Segmenter on a small portion of a video without
uploading a huge multi-GB file?
332:### Q10: Can I trust the per-segment metadata from the `motion` segmenter?
335:### Q11: I re-ran a video and my previous results changed/disappeared. Why?
338:### Q12: What is the `*.report.json` / `*.report.md` / `*.summary.md` file next to my video?
346:### Q13: A validation check failed and indexing was halted ? what do I do?
349:### Q14: The report says fps was a "fallback" (not probed) ? what does that mean?
360:## ? Annotation & Evaluation
366:# ...fill in start,end rows, then:
376:## ? Running the Test Suite
382:# One-liner full suite (recommended before opening a PR) ? discoverable wrapper that
383:# runs the whole suite, reports a clear PASS/FAIL, and returns pytest's exit code:
387:# ...or call pytest directly:

```

1      # UI Proposal ? khelsutra.guru web app (alpha ? beta)
2
3      **Status:** PROPOSAL ? awaiting owner ratification (no implementation starts without
explicit approval, per CLAUDE.md).
4      **Date:** 2026-06-10 . **Inputs:** PMF_MARKET_RESEARCH, COMMERCIALIZATION,
PLATFORM_ARCHITECTURE, DEFERRED_HARDENING_PLAN (#16), ROADMAP, VIDEO_RECORDING_GUIDELINES,
reporting/spec.yaml, current API + static UI.
5
6      > **? Partly shipped + in implementation (2026-06-21):** the alpha SPA now lives in
**`khelsutra/web/`**
7      > (the per-rally console shipped) and the marketing site in `khelsutra/site/`. The
**non-tech-savvy UX** half of

```

```

8      > this proposal is tracked in ``khelsutra/docs/FRIENDLY_AND_MULTILINGUAL.md``
(friendly + Hindi/Kannada). Treat
9      > the screens below as design intent; the live state is in that repo. *(Resolves
`DOC_STATUS.md` finding #5 for
10     > this doc; the static-UI references are historical ? that UI is retired.)*
11     **Companion:** `docs/HOSTING_PLAN.md` (domain, topology, costs).
12
13     ## 1. Strategic frame ? why a UI now, and what it secretly is
14
15     The UI is not just product surface; it is the **corpus-growth engine**. The single
highest-leverage
16     item in NEXT_STEPS is growing the golden corpus, and the v1 scope already commits to a
17     **human correction loop**. Every tester who accepts/rejects/nudges a rally boundary in
the review
18     screen produces exactly the labels the Gen-0/M0.x track is starved for (subject to the
per-user
19     training opt-in guardrail). 10?25 alpha testers ? a steady stream of labeled, real-
world,
20     multi-court-biased footage ? the distribution where the owned model's 0.66 ship target
lives.
21
22     Serving economics per the 2026-06-10 quality table: alpha serves the **Gemini path**
23     (0.93 on clean footage, ~$0.05/run) ? no GPU required in the request path. The
WASB/owned-model
24     path stays on the owner's box and is *not* exposed in the alpha UI (segmenter choice
hidden).
25
26     **The CLI is not replaced.** The web app talks to the same FastAPI surface the CLI
drives; the CLI
27     remains the power-user/ops tool.
28
29     ## 2. Personas (from PMF research)
30
31     - **Coach / academy (primary, B2B, India):** batches of match recordings, wants rally
review,
32     per-player reels for students/parents, per-rally stats. Already records on static
cameras.
33     - **Enthusiast (B2C funnel):** records own matches, wants a highlight reel + basic
stats, shares
34     with friends. Tripod discipline is the known adoption risk ? the UI must teach
recording
35     guidelines *before* upload, not fail videos after.
36
37     ## 3. ALPHA ? "quick & dirty" (goal: 10?25 invited testers, end-to-end, zero hand-
holding)
38
39     **Stack:** React + Vite + Tailwind SPA, deployed per HOSTING_PLAN (static hosting, $0).
40     API = existing FastAPI on the GPU box via tunnel at `api.khelsutra.guru`.

```

19. assistant (2026-06-22T18:50:11.229Z)

Now I have a complete picture. The root `README.md` (449 lines) is the de-facto end-user + developer install/usage guide, but it's a single mixed-audience doc heavy on CLI, config, FAQ, and test-suite ? not a clean "create a highlight reel" walkthrough for a non-technical user via the SPA. Let me read the README's "Running the Application" and "Batteries-included install" sections in full to nail the exact shipped state, and confirm what the SPA-based reel flow looks like (which lives in the khelsutra repo, not here).

20. user (2026-06-22T18:50:11.910Z)

```

35     ### 0. Batteries-included install (LIGHT tier ? recommended for end users)
36
37     For a download-and-run experience (no `git clone`, no PyTorch, no GPU), use the cross-
platform
38     installer. It installs the **LIGHT tier** (torch-free: Gemini / `motion` / cpu-mock),

```

```

writes a
39     launcher script (in your app-data folder), and seeds a sensible default config.
40
41     ```bash
42     # Preferred ? uv installs `indexer` into an isolated tool env:
43     uv tool install badminton-highlight-indexer          # (once published) or: uv tool
install .
44     # If `indexer` isn't found afterwards, add uv's tool-bin to PATH once: uv tool update-
shell
45
46     # Or the cross-platform installer script (uv-if-present, else pip) ? also writes a
launcher
47     # script (with the resolved `indexer` path baked in) + an uninstall manifest:
48     python scripts/install.py                          # add --method pip to force pip,
--dry-run to preview
49     ```
50
51     Then launch the app (the installer's shortcut, or directly):
52
53     ```bash
54     indexer --app          # boots a local server (127.0.0.1) and opens the bundled KhelSutra
UI
55     ```
56
57     * **First run seeds a truly-local default** ? detector `motion` (offline, **no API key,
no GPU,
58     no cloud bills**); the in-app setup later switches you to Gemini. State (config, DB,
reels) lives
59     in your OS app-data dir (`%APPDATA%\Khelsutra` / `~/Library/Application
Support/Khelsutra` /
60     `~/local/share/Khelsutra`) when launched via the installer's shortcut.
61     * **FFmpeg is still required** (see step 1) ? it is intentionally not redistributed (GPL
`libx264`).
62     * **Uninstall cleanly:** `python uninstall.py` (dropped next to your data) ? keeps your
config/reels
63     by default; add `--purge` to delete them too.
64
65     The native-GPU (WASB) and cloud tiers are separate, opt-in provisioning ? see
`docs/PACKAGING_PLAN.md`.
66
67     ### 1. External System Requirements
68     The indexer depends on **FFmpeg** and **FFprobe** to parse media containers, extract
keyframes, and stitch clips.
69
70     * **On Windows (PowerShell as Admin)**:
71     ```powershell
72     winget install Gyan.FFmpeg
73     ```
74     *Restart your terminal afterwards to register the path changes.*
75
76     ### 2. Install the package
77
78     The project is packaged with PEP 621 metadata in `pyproject.toml` (hatchling
build backend). Install it editable:
79
80
81     ```bash
82     # Runtime deps only:
83     pip install -e .
84     # Plus test + lint/type tooling (pytest, pytest-cov, httpx, ruff, mypy):
85     pip install -e .[dev]
86     ```
87
88     This registers the `indexer` console entry point (so `indexer --server`,
89     `indexer --help`, etc. work) and puts the `backend` and `training` packages on
your path.
90

```

```

91
92 > **PyTorch is installed separately.** `torch`/`torchvision` are intentionally
93 > *not* in `pyproject.toml`: their CPU/CUDA wheels need an out-of-band wheel index
94 > that PEP 621 cannot express. Install them yourself, matching your hardware:
95 > ```bash
96 > # NVIDIA GPU (CUDA 12.4):
97 > pip install "torch>=2.12.0" "torchvision>=0.27.0" --index-url
https://download.pytorch.org/whl/cu124
98 > # CPU only:
99 > pip install torch torchvision --index-url https://download.pytorch.org/whl/cpu
100 > ```
101
102 ### 3. Diagnostics Checker (`scripts/doctor.py`)
103 Run the diagnostics checker to verify your system dependencies, initialize a
104 default config, and (optionally) bootstrap the Python packages:
105 ```bash
106 python scripts/doctor.py
107 # or, via the CLI:
108 indexer --setup
109 ```
110 This script will:
111 * Validate `ffmpeg` and `ffprobe` are present in your PATH.
112 * Initialize a default `config.json` (if one does not exist) with thresholds for blur,
court HSV bounds, motion signals, YOLO velocity, chunking, and stitching.
113 * Detect whether an NVIDIA GPU is available (via `nvidia-smi`) and select the matching
PyTorch wheel index automatically (`cu124` if GPU present, `cpu` otherwise).
114 * Install everything from `requirements.txt`: `fastapi`, `uvicorn`, `opencv-python`,
`numpy`, `pydantic`, `jinja2`, `python-dotenv`, `google-genai`, `torch`, `torchvision`,
`supervision`.
115
116 > The default `yolo_hybrid` segmenter uses **torchvision**'s COCO-pretrained Faster
R-CNN, whose weights are downloaded and cached automatically by torchvision on first run ?
nothing is bundled in the repo. (Pick a lighter/heavier detector via `indexing.detector_model`:
`fasterrcnn_resnet50_fpn` (default), `fasterrcnn_mobilenet_v3_large_fpn`, or
`retinanet_resnet50_fpn`.)
117
118 ---
119
120 ## ? Running the Application
121
122 ### 1. Launching the Local Web App Dashboard
123 To start the FastAPI server and open the web dashboard:
124 ```bash
125 python -m backend.main --server --port 8000
126 ```
127 Open your browser and navigate to **[http://localhost:8000](http://localhost:8000)**.
128 *Simply input your local raw video file path in the sidebar to process, validate, index,
and compile highlights instantly.*
129
130 ### 2. Running in CLI Processing Mode
131 To process and index a video completely via terminal commands:
132 ```bash
133 python -m backend.main --video-path "C:/path/to/my_video.mp4"
134 ```
135 This outputs a validation summary and indexes all rallies directly into the local SQLite
database, using whichever segmenter is set as `default_segmenter` in `config.json`. **The
shipped `config.json` sets `gemini`** (needs `GEMINI_API_KEY`; without it the run silently
produces 0 segments and the observability report flags `silent_provider_noop`). Set it to
`yolo_hybrid`/`wasb_hybrid`/`motion` for the local paths.
136
137 To explicitly pick a segmenter for one run:
138 ```bash
139 python -m backend.main --video-path "C:/path/to/my_video.mp4" --segmenter yolo_hybrid
140 python -m backend.main --video-path "C:/path/to/my_video.mp4" --segmenter gemini
141 python -m backend.main --video-path "C:/path/to/my_video.mp4" --segmenter motion

```

```

142     ``
143
144     ### 3. Rich CLI Debugging (`--debug-clip`)
145     To diagnose exactly why a video segment was registered as active/dead play, or inspect
146     detailed focus/continuity metrics at a particular time in seconds:
147     ```bash
148     python -m backend.main --video-path "C:/path/to/my_video.mp4" --debug-clip 125.5
149     ``
150     *Outputs granular validation check logs and motion ratios within a +/- 3 second frame
151     window around the timestamp.*
152
153     ### 4. Extracting a Trimmed Segment (`--trim-start` / `--trim-end`) ? also the quickest
154     watermark preview
155     Extract a slice of a recording to disk (re-encoded; and, with the default-on branding
156     watermark, stamped "Generated by Khelsutra.guru" in the corner):
157     ```bash
158     python -m backend.main --video-path "C:/path/to/my_video.mp4" \
159     --trim-start 600 --trim-end 660 --trim-output slice_10m_to_11m.mp4
160     ``
161     Output lands in `--output-dir` (default `output/`) unless `--trim-output` is an absolute
162     path. This is the fastest way to see the watermark on a real clip ? set
163     `stitching.watermark.enabled: false` in `config.json` to turn it off.
164
165     > To preview the exact overlay on any file without the pipeline:
166     > ```bash
167     > ffmpeg -i in.mp4 -vf "drawtext=text='Generated by Khelsutra.guru':font='DejaVu Sans':f
168     ontcOLOR=white@0.85:fontSize=h/28:x=w-tw-24:y=h-th-24:box=1:boxcolor=black@0.4:boxborderw=10"
169     -c:a copy out.mp4
170     > ```
171
172     ### 5. End-to-End "Process + Stitch" Script
173     `scripts/run_process_and_stitch.py` is an interactive convenience runner: it MD5-hashes
174     a hardcoded video path, reuses cached indexed segments if available (offering to re-index from
175     scratch), and then prompts for stitching parameters (`begin_padding`, `end_padding`,
176     `min_shot_count`) before compiling the final highlight reel. Useful when iterating on stitching
177     settings against a fixed large recording without re-running expensive segmentation.
178
179     ### 6. Cache Hygiene & Disk Cleanup
180     The trajectory detectors (`wasb_hybrid` / `tracknet_hybrid`) stage a copy of each video
181     into WSL and decode every frame to PNG ? easily **tens of GBs per 4K video**. To keep disk usage
182     bounded:
183
184     * **Automatic self-clean:** after a successful run the frame cache + staged copy are
185     deleted (`indexing.{wasb,tracknet}.keep_frames`, default `false`). On failure they're kept so a
186     re-run resumes from the checkpointed detector cache.
187
188     * **Manual sweep (dry-run-first):** `tools/cleanup_caches.py` reports and (with
189     `--apply`) reclaims what failed/old runs left behind, across both the WSL stage dir and
190     `output/`:
191     ```bash
192     python -m tools.cleanup_caches                                # report what's reclaimable (safe;
193     deletes nothing)
194     python -m tools.cleanup_caches --apply                        # delete the regenerable caches
195     python -m tools.cleanup_caches --keep-video GX010125         # protect one video's cache
196     (id or filename stem)
197     python -m tools.cleanup_caches --older-than 7                # only purge entries older than 7
198     days
199     ``
200     It treats frame caches, staged/proxy videos, and handoff/temp dirs as
201     **regenerable** (purgeable) and always keeps trajectory CSVs, the SQLite DB, and final reels.
202     Add `--include-wasbcache` to also drop detector resume caches. `--summary` prints a one-line
203     nudge (used by the optional SessionStart hook).
204
205

```

I now have everything needed for a verified recommendation. Let me do two final confirmations: that `indexer --app` and `--server` flags actually exist in code (the README claims them), and how DOC_STATUS treats the README (whether it's a tracked doc).

22. user (2026-06-22T18:50:18.402Z)

23. assistant (2026-06-22T18:50:53.725Z)

I have all verified facts. Note `docs/README.md` is a flat doc index (no top-level title/intro heading ? it begins mid-list at line 1 with `RALLY\_QUALITY\_RESEARCH.md`), and the root README is governance-listed as a LIVING doc in `DOC\_STATUS.md:73`. Here is my recommendation.

Recommendation

Is there an existing end-user install+usage guide?

Partially ? in the root `README.md`, not in `docs/`. There is **no** `QUICKSTART` / `USER\_GUIDE` / `getting-started` doc anywhere under `docs/` (verified: filename grep for those patterns returns nothing; the only content hits for "quickstart/user guide" are in strategy docs `PLATFORM\_ARCHITECTURE.md`, `COMMERCIALIZATION.md`, `I18N\_PLAN.md`, and archived vendoring docs ? none are end-user reel guides).

What **does** cover install+usage for end users today is the repo-root **README.md** (449 lines, `README.md:1-449`). It already has:

- An explicit **Batteries-included install** (LIGHT tier ? recommended for end users) section (`README.md:35-65`) covering `uv tool install` / `scripts/install.py` ? `indexer --app` (CLI flag verified to exist at `backend/main.py:1139`), app-data state dirs, ffmpeg caveat, and clean uninstall.
- **Running the Application** (`README.md:120-181`) ? launching the web dashboard (`indexer --server`, flag verified `backend/main.py:1138`), CLI processing mode, and reel/trim/watermark usage.
- A 14-question **FAQ** (`README.md:254-359`) and config-tuning reference (`README.md:182-253`).

But it is a mixed-audience doc ? heavily weighted toward developers/power-users (editable `pip install -e .`, PyTorch wheel indices, `--debug-clip`, `config.json` threshold tuning, the test suite, project structure). It is **not** a clean, task-first "non-technical user creates a highlight reel" walkthrough, and the actual friendly reel-creation flow is the **SPA**, which lives in the **sibling** `khelsutra` repo, not this engine repo (`UI\_PROPOSAL.md:6-10` confirms the alpha SPA moved to `khelsutra/web/` and the non-tech UX is tracked in `khelsutra/docs/FRIENDLY\_AND\_MULTILINGUAL.md`). So this engine repo has no dedicated end-user guide for the reel-creation user journey.

Recommended placement for the new guide

Create a new doc: `C:/Users/avidu/Projects/bhi-computeval/docs/CREATING\_REELS.md` (a task-oriented "install ? process a video ? pick rallies ? get a watermarked reel" guide for end users via `indexer --app`).

- Prefer `CREATING\_REELS.md` over `USER\_GUIDE.md`: it is action/outcome-named (matches this repo's doc-naming style ? `PACKAGING\_PLAN`, `SETUP\_NEW\_MACHINE`, `CLOUD\_GPU\_DRYRUN\_GUIDE`) and avoids colliding conceptually with the root README, which is already the catch-all "user guide."
- Do **not** name it `QUICKSTART.md` if it will be more than a few steps; reserve that only if you want a deliberately short page.

Should an existing doc be updated/linked instead?

- **Do not duplicate** the root `README.md` install section ? **link to it**. The new guide should reference the root README's "Batteries-included install" (`README.md:35-65`) for install mechanics and focus on the **usage journey** (open the app, point at a video, review/pick rallies, download the reel), not re-derive install.
- **Scope check** (verified, not aspirational): **indexer --app** ships and boots the bundled SPA single-origin (`backend/main.py:1139`; `PACKAGING\_PLAN.md:12` "v1 LIGHT is FEATURE-COMPLETE"). The **native-GPU** (WASB) and cloud serving tiers are owner-only / not in the default download (`README.md:65`, `PACKAGING\_PLAN.md:18,23`) ? the guide must say the default LIGHT tier is

Gemini/`motion`/cpu-mock only and NOT promise on-device GPU quality or one-click cloud. ****ffmpeg is a manual prerequisite**** (`README.md:61,67-74`) ? not auto-installed; call this out as a required step.

- Cross-repo note: the friendly multilingual reel UX itself is implemented in the sibling `khelsutra` repo (`UI\_PROPOSAL.md:6-10`). If the guide documents on-screen SPA steps, flag that the UI is bundled from there so screenshots/wording stay in sync.

How `docs/README.md` indexes docs (so the new one is added consistently)

`docs/README.md` is a ****flat, single-level bulleted index grouped under `##` section headings**** (verified `README.md:1-44`). Each entry is one bullet of the exact form:

...

- FILENAME.md ? ****<bold status/tag>**** one-paragraph description (what it is, status, source-of-truth pointer).

...

Sections present: ***(top, untitled list)*** ? `##` ? Documentation status & governance` ? `## Product / platform plans` ? `## Practical / ongoing` ? `## Data layer` ? `## Conventions & templates` ? `## Historical documents`. There is **\*\*no H1/intro\*\*** ? the file opens directly at line 1 with the `RALLY_QUALITY_RESEARCH.md` bullet.

****Add the new guide under `## Practical / ongoing`**** (alongside `SETUP\_NEW\_MACHINE.md` at `README.md:23`, which is the dev/ops runbook ? the new doc is its end-user counterpart), as e.g.:

`- [CREATING\_REELS.md](CREATING\_REELS.md) ? **\*\*? End-user guide:\*\*** install the LIGHT-tier app (? root README §0) ? indexer --app ? process a video ? pick rallies ? download a watermarked reel. LIGHT tier only (Gemini/motion/cpu-mock; no on-device GPU/cloud). Pairs with PACKAGING\_PLAN.md.`

Also: governance convention per `CODE\_MAP.md:33` ("A doc ? Index it in `docs/README.md`") and `DOC\_STATUS.md:21` ? when you add it, list it in `docs/README.md` and add a row/mention to `docs/DOC\_STATUS.md` (the README itself is already tracked there as LIVING at `DOC\_STATUS.md:73`).

Verification caveat

`git pull --ff-only` ****failed**** ? the local checkout is on branch `feat/compute-provenance` whose remote ref wasn't fetched (HEAD `ee6fba8`), so these facts reflect the ****local checkout, which may lag/lead `origin/master`****. All `file:line` citations above were read from the working tree; re-verify the README line ranges against `origin/master` before writing, since the root README is a LIVING doc that moves between sessions.
