Transcript

1. user (2026-07-02T06:11:33.378Z)

In C:\Users\avidu\Projects\badminton-highlight-indexer: config.json's `stitching.begin\_padding` / `stitching.end\_padding` are silently ignored by the live highlight compiler. `backend/main.py` (around lines 508 and 633) constructs `VideoCompiler(output\_dir, watermark=...)` WITHOUT passing the configured paddings, so the live stitcher always uses the constructor defaults in `backend/pipeline/stitcher/compiler.py:10` (begin=0.5, end=1.0). The config values are only read by `backend/pipeline/segmenters/gemini.py` (~lines 406-408) for a log-line duration estimate. This was audit finding (d) from the 2026-06-10 deep audit and was re-verified as still live on 2026-06-12. Fix: thread the typed config stitching paddings into both VideoCompiler construction sites, add a regression test asserting a config padding override changes the compiled clip boundaries. Note a cross-repo coupling: sports-data-collector `src/parsers/cvat/rally\_cvat.py` detect_issues docstring (~lines 288-294) justifies not flagging vendor boundary slack by citing the compiler's 0.5/1.0 padding ? if defaults/wiring change, update that rationale comment too. Follow repo conventions: branch off master, one PR, run `python run\_all\_tests.py`.

2. assistant (2026-07-02T06:11:33.378Z)

I'll start by reading the session handoff and the relevant code to confirm the finding, then implement the fix on a branch.

10    # Current state ? updated continuously (see [[working-agreement-checkpoints]])
11
12    **Checkpoint:** 2026-06-11 (UI-alpha **PR-2 #99 MERGED + docs-sync #100 MERGED** ? owner
authorized merge w/ due
13    diligence; master `020ff61`). **LIVE E2E AT MERGE (server up on :8123, real
artifacts):** 86MB smoke video uploaded in
14    3 sequential parts ? reassembled to **MD5 byte-identity** with the source; negatives
verified (out-of-order 409,
15    bad-ext/traversal 400, unknown-id 404; download traversal blocked at BOTH layers ?
handler 400 on backslash form,
16    router 404 on %2F form); **compile of the real confirmed rally ? 3.9MB reel streamed via
GET /api/highlights** (the
17    fixed segment_ids path works browser-equivalent). #100 = doc due diligence: NEXT_STEPS
(PR-2 merged + sweep recorded),
18    UI plan PR-2 checked off w/ E2E evidence, **BACKLOG shlex item closed** (residual
tenancy note kept). The CUJ runbook
19    (PR2_HANDOFF $"Tomorrow-morning") is now fully unblocked for the owner. ?? NEXT: owner
CUJ; PR-3 identity (remember:
20    `allowed_video_root` must contain `upload_dir`). Original handoff context below:
21    (superseded) **Checkpoint:** 2026-06-11 (UI-alpha PR-2 executed ? #99 was awaiting
review ? per the Cowork handoff
22    `scratch/PR2_HANDOFF.md`; protocol = Cowork designs, Claude Code runs mechanics, **Avi
reviews/merges ? do NOT
23    auto-merge #99**). #88 confirmed CLOSED ? PR88_FIX skipped. Cowork's uncommitted B2+B3
implementation verified to
24    layer cleanly on post-sweep master (AI-7 CODE_MAP entries + pydantic fixes intact) ?
Step 0 run here (Cowork sandbox
25    down): suite **388 green** (15 new `tests/test_upload_download.py`), mypy clean; 3
trivial ruff B904s in the new
26    endpoints fixed per the handoff's trivial-fix rule (exception chaining only, no design
changes). Branch
27    `feat/upload-download`, exactly the 8 handoff files committed ? **including the two
long-preserved doc edits**
28    (DEFERRED_HARDENING_PLAN #16-banner + UI_ALPHA_EXECUTION_PLAN working-agreement
rewrite), which are now COMMITTED
29    (tree finally clean of them). CI 4/4 green on #99. ?? NEXT: owner reviews/merges #99 ?
then the tomorrow-morning CUJ
30    runbook in the handoff (record ? localhost:8000 ? path-paste ? index ? compile ? ?
download; gemini default,
31    rotated key in .env, ~$0.05/run). PR-3 = per-user dirs + allowed_video_root?upload_dir
(hosted-mode note).
32
33    **Checkpoint:** 2026-06-11 (8?9 QUALITY SWEEP ? COMPLETE ? all approved AIs landed;
master `31069cb`). Final stretch:
34    **AI-7 hybrid-twin collapse** = shared `segmenters/trajectory_hybrid.py` engine
(tracknet/wasb now ~40-line subclasses;
35    one `_shot_count_from`; `_wsl_bash` ? `detectors/base.py::WslCommandMixin`;
DetectorRunner ABC now declares the
36    parse/windowing contract; mypy quarantine ratcheted ?2; 13 equivalence tests; CODE_MAP
2.1/2.2 updated). ? PROCESS SLIP
37    (disclosed): AI-7 commit `2c241a8` went DIRECTLY to master (post-#96 script left
checkout on master) ? content was
38    pre-approved + locally verified; master CI green post-hoc; chose NOT to force-rewind
(concurrent sessions live).

config.json:73: "begin_padding": 0.5,
config.json:74: "end_padding": 0.5,
README.md:28:* **High-Speed FFmpeg Stitching** with configurable `begin_padding`,
`end_padding`, and `min_shot_count` filtering, plus an optional **branding watermark** burned
into every reel (**on by default** ? `Generated by Khelsutra.guru`, fully configurable, with
an off switch).
README.md:104:`run_process_and_stitch.py` is an interactive convenience runner: it MD5-hashes a
hardcoded video path, reuses cached indexed segments if available (offering to re-index from
scratch), and then prompts for stitching parameters (`begin_padding`, `end_padding`,
`min_shot_count`) before compiling the final highlight reel. Useful when iterating on stitching
settings against a fixed large recording without re-running expensive segmentation.
README.md:149: "begin_padding": 0.5,

```
[external_agent_tool_result]
96     - `@backend/config/models.py` ? Pydantic v2 models; **single source of truth for
defaults**.
97     - `::AppConfig` ? root. Scalars `sport='badminton'`, `ai_provider='gemini'`,
`ai_model='gemini-2.5-flash'`; sections `validation`, `indexing`, `output`, `stitching`
(`default_factory`). `model_config` = {extra:'allow', validate_assignment:True}`. ?
`extra='allow'` -> unknown/typo'd config.json keys silently kept (legacy tolerance).
98     - ? `::AppConfig.get` ? legacy dict-compat shim: returns nested **sections as plain
dicts** (`model_dump(mode='json')`, NOT the model) so chained
`config.get("indexing",{}).get(...)` keeps working; falls back to searching a leaf key in any
section (sections discovered dynamically from `model_fields`). ? "bit every validator on real
runs" per docstring ? returning the model breaks `.get`. `::AppConfig.__getitem__` raises
`KeyError` for unknown top-level keys else delegates to `.get`.
99     - `::IndexingConfig` ? segmenter/detector knobs (`motion_threshold=0.08`,
`min_segment_duration=3.0`, `dead_time_merge_gap=2.0`, `chunk_duration=90.0`,
`chunk_overlap=10.0`, `yolo_velocity_threshold=0.15`, `yolo_frame_skip=3`,
`ai_handoff_padding=2.0`, `ai_max_workers=5`, `log/store_yolo_candidates=True`, nested
`tracknet`). ? `default_segmenter='yolo_hybrid'` HERE but config.json overrides to `gemini`. ?
`::IndexingConfig.segmenter_must_be_registered` `@field_validator` is a **no-op pass-through** ?
a typo'd segmenter validates fine, only fails later at `segmenter_registry.get(...)` .
100    - `::ValidationConfig` (`min_resolution_width=1280`, `min_resolution_height=720`, `min_fps=29.9`,
`min_blur_threshold=20.0`, `max_scene_cuts_per_minute=0.5`, nested `relevance`);
`::ValidationRelevanceConfig` (court HSV gates, `court_pixels_min_ratio=0.05`);
`::TrackNetConfig` (WSL invocation contract: `wsl_distro='Ubuntu'`, `repo_dir`,
`conda_env='TrackNetV4'`, `weights_path='', `queue_length=5`, `velocity_threshold=0.02`);
`::OutputConfig` (`default_highlights_name`, `db_name='sports_indexer.db'`,
`output_dir='output'` ? CLI `--output-dir` overrides it on the typed model in `main()`).
`::StitchingConfig`
(`begin_padding=0.5`, `end_padding=0.5`, `use_cache=False`, `min_shot_count=1`). `::Sport` Literal
of 5 sports. `::Config` = `AppConfig` alias.
101    - `@backend/config/loader.py` ? load/save with defaults-merge.
102    - `::DEFAULT_CONFIG_PATH` = Path("config.json")` (? CWD-relative, NOT repo-root).
`::get_builtin_defaults` = `AppConfig().model_dump(...)` .
103    - `::load_config` ? precedence built-in-defaults -> file overrides. ? **shallow top-
level merge** (`{**defaults, **file_data}`): a section in config.json REPLACES the whole
defaults dict for that section (Pydantic then re-applies field defaults for missing leaves).
Missing/unreadable/parse-error file -> fully-defaulted AppConfig + `[CONFIG WARNING]` (non-
fatal).

[external_agent_tool_result]
152    ### 2.4 Stitcher / tools / utils
153    - `@backend/pipeline/stitcher/compiler.py::VideoCompiler` ? `compile_highlights(raw,
segments:[(start,end)], out_name)`. Per-clip re-encode -> `-f concat -c copy`. `::parse_time`
(mirrors gemini.parse_time; ? unparseable -> 0.0), `::get_video_duration`. ? if duration probe
fails (0.0) NO boundary validation; `begin_padding`(0.5)/`end_padding`(1.0) defaults; temp clips
in a TemporaryDirectory under output_dir; raises ValueError/FileNotFoundError/RuntimeError; uses
`print()`. ? two-stage codec contract: clips re-encoded with IDENTICAL settings precisely so
final concat can stream-copy ? change a preset and concat may break. ? optional **branding
watermark** (`stitching.watermark`, default-on): `::watermark_filter` builds a `-vf` (drawtext
via `textfile=` + optional logo `movie/overlay`) applied to the per-clip re-encode only (concat
stays `-c copy`); a failed watermark encode retries the clip WITHOUT it (never nukes the reel).
Pass `watermark=` to `VideoCompiler(...)` (a `WatermarkConfig` model or dict; `None` = off).
154    - `@backend/tools/rally_slicer.py` ? standalone CLI. `::compute_clip_windows` (pure,
unit-tested), `::load_rally_labels` (golden schema; ? silently skips degenerate rows),
```

```
`::slice_rallies`, `::ClipWindow`(rally:str), `::BEGIN_PADDING=0.5`/`::END_PADDING=1.0` (?
duplicate compiler's by copy). `_read_time` -> backend/eval/annotations.parse_timestamp`.
155 - `@backend/utils/video.py` ? `::get_video_duration` (ffprobe; ? 0.0 on failure =
"unknown"), `::extract_video_chunk(...,reencode=False,scale_width=None)` . ? copy mode cuts at
nearest keyframe (drift) ? pass `reencode=True` for short/accurate clips; `scale_width` requires
`reencode=True`.

fix(api): thread config stitching paddings into live VideoCompiler sites
```

config.json stitching.{begin_padding,end_padding} were silently ignored by the live highlight compiler: /api/compile and the CLI trim path constructed VideoCompiler(output_dir, watermark=...) without them, so reels always used the constructor defaults (0.5/1.0) instead of the typed config (0.5/0.5). Audit finding (d) from the 2026-06-10 deep audit.

- backend/main.py: both construction sites now pass begin_padding/end_padding from the typed StitchingConfig (API falls back to StitchingConfig() when global_config is unset, matching the existing defensive idiom).
- backend/config/__init__.py: re-export StitchingConfig.
- tests/test_api_endpoints.py: regression test drives the REAL VideoCompiler through /api/compile with mocked ffmpeg and asserts a config padding override (2.0/3.0) changes the trim boundaries (-ss 8.0 / -to 17.0 for a 10-14s segment; the unwired defaults would give 9.5/15.0).
- docs/CODE_MAP.md: truth-sync the stitcher entry + padding recipe row.

Suite: 401 passed (run_all_tests.py); ruff + mypy clean on touched files.

"fix(api): thread config stitching paddings into live VideoCompiler sites" --body '@'
```

What

`config.json stitching.{begin\_padding,end\_padding}` were **silently ignored** by the live highlight compiler. Both `VideoCompiler` construction sites in `backend/main.py` (`/api/compile` and the CLI `--trim` path) passed only `watermark=`, so reels always used the constructor defaults (begin 0.5 / **end 1.0**) instead of the configured values (0.5/0.5). The config values were only read by `gemini.py` for a log-line duration estimate. This is **finding (d)** of the 2026-06-10 deep audit, re-verified live on 2026-06-12.

Changes

- **backend/main.py** ? both construction sites now thread `begin\_padding`/`end\_padding` from the typed `StitchingConfig` (the API site falls back to `StitchingConfig()` when `global\_config` is unset, matching the existing `getattr` defensive idiom; the CLI trim site loads the typed config it already loaded for the watermark).
- **backend/config/__init__.py** ? re-export `StitchingConfig`.
- **tests/test_api_endpoints.py** ? regression test drives the **real** `VideoCompiler` through `/api/compile` with mocked ffmpeg/ffprobe and asserts a config padding override (2.0/3.0) reaches the trim boundaries: `-ss 8.0 / -to 17.0` for a 10?14s segment (the unwired defaults would produce 9.5/15.0).
- **docs/CODE_MAP.md** ? truth-sync: stitcher entry now distinguishes ctor defaults (0.5/1.0) from the config-driven live call sites (0.5/0.5); padding recipe row points at the `backend/main.py` wiring.

Behavior change

Live API reels previously got 1.0s end padding; with the shipped `config.json` they now get the configured `**0.5s**`. `run\_process\_and\_stitch.py` already passed config values, so it is unchanged.

Cross-repo note

`sports-data-collector` `src/parsers/cvat/rally\_cvat.py::detect\_issues` docstring justified not flagging vendor boundary slack by citing the compiler's hardcoded 0.5/1.0 padding ? companion PR updates that rationale to the config-driven values.

Verification

- `python run\_all\_tests.py`: `**401 passed**` (includes the new regression test)
- ruff + mypy clean on touched files

docs(cvat): update detect_issues padding rationale to config-driven values
```

The docstring justified not flagging sampling density by citing the indexer compiler hardcoded `begin_padding=0.5s/end_padding=1.0s`. The indexer now threads `config.json stitching.{begin_padding,end_padding}` (`0.5s/0.5s` as shipped) into the live compiler (indexer PR #102); cite that + fix the stale module path.

update detect_issues padding rationale to config-driven values" --body '@'
```

What

``detect_issues`` in ``src/parsers/cvat/rally_cvat.py`` justifies not flagging vendor sampling density by citing the indexer compiler's `***hardcoded*** `begin_padding=0.5s / end_padding=1.0s``. That citation is now stale on two counts:

1. The indexer threads ``config.json stitching.{begin_padding,end_padding}`` into the live compiler as of [badminton-highlight-indexer #102](https://github.com/avidullu/badminton-highlight-indexer/pull/102) ? the shipped values are `***0.5s/0.5s***` (the old `1.0s` end padding was an unwired constructor default).

2. The module path moved: `backend/pipeline/stitcher/compiler.py` (was cited as `backend/stitcher/compiler.py`).

Docstring-only change; the rationale itself (?0.5s padding absorbs ~0.5s sampling slack) still holds at 0.5/0.5.

91. assistant (2026-07-02T06:11:33.385Z)

Done. The fix is shipped as two PRs, both CI-green and awaiting your review ? I did not merge anything.

```

**[badminton-highlight-indexer #102](https://github.com/avidullu/badminton-highlight-
indexer/pull/102)** ? the actual fix:
- Both `VideoCompiler` construction sites in [backend/main.py](backend/main.py) (`/api/compile`
around line 508 and the CLI trim path around line 633) now pass `begin_padding`/`end_padding`
from the typed `StitchingConfig`, alongside the watermark they already passed. The API site
keeps the existing defensive idiom by falling back to `StitchingConfig()` when `global_config`
is unset; `StitchingConfig` is now re-exported from `backend.config`.
- New regression test in [tests/test_api_endpoints.py](tests/test_api_endpoints.py) drives the
**real** compiler through `/api/compile` with mocked ffmpeg/ffprobe and asserts that a config
override of 2.0/3.0 actually moves the trim boundaries to `-ss 8.0 / -to 17.0` for a 10?14s
segment ? the previously unwired defaults would have produced 9.5/15.0, so this test fails on
the old code.
- [docs/CODE_MAP.md](docs/CODE_MAP.md) truth-synced: the stitcher entry now distinguishes the
constructor defaults (0.5/1.0) from the config-driven live call sites (0.5/0.5), and the padding
recipe row points at the `main.py` wiring.
- Verified: `python run_all_tests.py` ? **401 passed**; ruff and mypy clean on touched files;
all 4 CI lanes green.

```

One behavior change worth knowing before merge: live API reels currently get 1.0s of end padding; with the shipped `config.json` they'll get the configured **0.5s** after this lands.

****[sports-data-collector #20](https://github.com/avidullu/sports-data-collector/pull/20)**** ? the cross-repo coupling you flagged: the `detect\_issues` docstring in `rally\_cvat.py` now cites the config-driven 0.5/0.5 paddings instead of the hardcoded 0.5/1.0 (and the corrected module path). Docstring-only; collector suite 137 passed, CI green. Your uncommitted `.gitignore` edit there was left untouched.

Both checkouts are back on `master`, and I recorded a checkpoint in the memory current-state file (noting the padding-rationale interaction with the in-flight Roora boundary-slack thread, since that rationale now rests on 0.5s rather than 1.0s of end padding). One observation: an untracked `arial.ttf` appeared at the indexer repo root ? not from this work; I left it alone, but it may be a stray from a watermark-font experiment.

92. user (2026-07-02T06:11:33.385Z)

Can you update the global skill/memory/reminder for yourself to **always git pull the repo before even starting to read it** because I have an occupational hazard of ensuring I always close/leave a session with a "clean slate" but often I have multiple parallel slates, so a git pull would ensure the local starts where remote truly is.

93. assistant (2026-07-02T06:11:33.385Z)

I'll add this to your global `~/.claude/CLAUDE.md` (the instructions loaded in every project session), since the memory directory is per-project and you asked for a global rule.

1      # Global instructions (all projects)
2
3      ## Session-handoff convention
4      Maintain a living **session handoff** for each project and use it to resume context
quickly
5      across windows.
6
7      - **Where it lives:**
8      - If the project has an auto-memory dir (`~/.claude/projects/<project>/memory/`), keep
the
9      handoff as `session-handoff.md` there, and list it under a **"? Start here"*** entry
at the
10     top of that project's `MEMORY.md`.
11     - Otherwise, keep a `SESSION_HANDOFF.md` at the repo root.
12     - **What it contains** (keep it to ~1 page ? it POINTS to detailed artifacts, never
duplicates them):
13     1. **You are here** ? current state.
14     2. **Next steps / open threads.**
15     3. **Ramp-up kit** ? the exact files/docs to read to get current.
16     4. **Key decisions** ? so they aren't relitigated.
17     - **At session start:** if a handoff exists, read it before starting substantive work,
and use it
18     (plus its ramp-up kit) to get up to speed instead of replaying past conversation.
19     - **Updating it:** keep it current **automatically** ? refresh at meaningful checkpoints
(a PR is
20     pushed/merged, a key decision is made, work shifts phase, or a session is wrapping
up), so a
21     restart can ramp up without losing context. Do **not** rewrite it every turn ? only
when
22     something worth resuming from changed. The phrases **"update the handoff"*** /
**"refresh the
```

```
23         handoff*** force an immediate full rewrite on demand.
24     - **Keep it honest:** it reflects real, shipped state ? never aspirational. (See each
project's
25         attribution/working-agreement note where present.)

The rule is saved. Applying it right now to both repos as a first exercise:

99. assistant (2026-07-02T06:11:33.385Z)

```
[external_agent_tool_call: PowerShell]
description: Fast-forward pull both repos on master
command: git -C C:\Users\avidu\Projects\badminton-highlight-indexer pull --ff-only && git -C
C:\Users\avidu\Projects\sports-data-collector pull --ff-only
[/external_agent_tool_call]
```

100. assistant (2026-07-02T06:11:33.385Z)

```
[external_agent_tool_result]

Already up to date.
[/external_agent_tool_result]
```

101. assistant (2026-07-02T06:11:33.385Z)

Done. The rule now lives at the top of your global `~/.claude/CLAUDE.md`, so it loads in every session across all projects:

```
- **Always `git pull` before starting to read a repo** ? at session start for the working
directory, and again for any sibling repo (like `sports-data-collector`) the moment work touches
it.
- **Safe form only:** `git pull --ff-only` ? never auto-merge, rebase, or discard local state to
make a pull succeed.
- **If it can't fast-forward** (diverged branch, dirty tree): report the state and proceed read-
only on local, flagged as possibly stale ? uncommitted changes are treated as a sibling
session's or your WIP and never clobbered.
```

I also captured your *why* in the rule itself ? parallel "clean slates" mean master moves between sessions ? so future sessions understand the intent, not just the mechanic.

And it paid off immediately: running the pull on both repos just now, both masters were already current, but the fetch surfaced a new remote branch `claude/watermark-bundled-font` from another session ? which neatly explains the stray `arial.ttf` I'd flagged at the indexer root earlier (it's that session's watermark-font experiment, left alone).

One option if you ever want this enforced mechanically rather than by instruction: a

`SessionStart` hook in `settings.json` could run the `--ff-only` pull automatically before I even wake up. I'd lean against it ? a hook pulls blindly without first checking for a dirty tree or a sibling session mid-work on a feature branch, whereas the instruction lets me look before pulling ? but say the word and I'll set it up.

102. user (2026-07-02T06:11:33.385Z)

Can you run the highlight indexer? Using the GPU? end to end. and show me highlights for the video that I'm attaching. Only for rallies where the number of shots were more than 7. You will have to. update the configs and make sure that The number of shots config is picked up. Let me know if that is not possible. "F:\GoPro Hero Black 12\KhelSutra\Badminton 12 June 2026\GX010125.MP4"

1      """WASB-based hybrid play segmenter.
2
3      Phase 2 uses **WASB** (nttcom/WASB-SBDT, MIT) shuttle-trajectory detection via
4      WSL2 (backend/pipeline/detectors/wasb_runner.py). WASB ships pretrained
5      badminton weights and runs today, so this is the live shuttle-motion substrate.
6
7      For the per-video *calibration* goal we mainly use Phase 2 (trajectory ->
8      candidate windows); the windowing thresholds (velocity_thresh / merge_gap /
9      min_window_duration) are what get tuned against golden rally labels.
10
11     The pipeline engine (healthcheck -> trajectory -> windows -> AI handoff -> DB)
12     lives in trajectory_hybrid.TrajectoryHybridSegmenter; this class only wires the
13     WASB runner and identity.

[external_agent_tool_result]
Monitor started (task b0emrus25, persistent ? runs until TaskStop or session end). You will be notified on each event. Keep working ? do not poll or sleep. Events may arrive while you are

waiting for the user ? an event is not their reply.
[/external_agent_tool_result]

154. assistant (2026-07-02T06:11:33.389Z)

The end-to-end run is **launched and being monitored**. Here's the setup and what to expect:

What's running (background job ``bwqevfnlg``, log at `[output/gx010125_run.log](output/gx010125_run.log)`):

- MD5 hash** of the 11.5 GB source (this is the ``video_id``) ? a few minutes.
- WASB shuttle-trajectory detection on the GPU** (RTX 2070 Super via WSL2 Ubuntu, pretrained badminton weights ? verified present) over the full 12.8-minute 4K60 video ? candidate rally windows.
- Gemini confirmation** of each candidate window (serial uploads with backoff, re-encoded 1280p chunks) ? confirmed rallies **with per-rally ``shot_count``** (Gemini's shuttle-exchange count; duration-based estimate only if the model omits it).
- Filter + stitch**: only rallies with ``shot_count`` ≥ 8 (your ">7 shots") survive, then the compiler cuts and concatenates them with the configured paddings and watermark into ``output/GX010125_highlights.mp4``.

Your config question ? yes, it's possible, with one nuance. ``stitching.min_shot_count`` is honored by the offline runner flow (``run_process_and_stitch.py`` lineage), which is what I'm using ? I set it to **8** in `[config.json](config.json)` and the runner reads it from config with no override, logging each segment's shot count and KEEP/drop decision so you can audit the filter. The nuance: the **API path** (``/api/compile``) does **not** apply ``min_shot_count`` ? it stitches exactly the ``segment_ids`` the caller picks (the UI is expected to filter). If you want the config filter enforced on the API path too, that's a small PR ? say the word.

Config changes made (local, uncommitted): ``indexing.default_segmenter: gemini ? wasb_hybrid`` (the GPU path you asked for) and ``stitching.min_shot_count: 1 ? 8``. Also synced to head first ? your merge of the padding fix (#102) means this run uses the now config-driven 0.5s paddings.

Expect roughly 30?60+ minutes total (GPU inference on ~46k frames is the long pole). The monitor will report each phase as it lands; I'll summarize the kept rallies and the reel path when it finishes.

155. user (2026-07-02T06:11:33.390Z)

```
<task-notification>
<task-id>b0emrus25</task-id>
<summary>Monitor event: "GX010125 E2E run milestones (phases, filter, errors)"</summary>

1.11.0+cu113 cuda True</event>
If this event is something the user would act on now, send a PushNotification. Routine or benign
output doesn't need one.
</task-notification>
```

156. assistant (2026-07-02T06:11:33.390Z)

Early milestones are clean ? and the config pickup is proven right at startup:

- ``[CONFIG] segmenter=wasb_hybrid | min_shot_count=8 | begin_padding=0.5s end_padding=0.5s | watermark=on`` ? all four knobs read from ``config.json``.
- MD5 hashing the 11.5 GB took only 25s (``video_id=c794a7af``).
- GPU healthcheck passed: WSL env OK, ``torch 1.11.0+cu113, cuda True``.

WASB trajectory inference is now running on the GPU ? the long pole. Next milestone will be the trajectory-points/candidate-windows line.

157. user (2026-07-02T06:11:33.390Z)

I dont see GPU being used. can you check

158. assistant (2026-07-02T06:11:33.390Z)

Likely the run is still in the staging step (copying the 11.5 GB file into WSL before inference), but let me verify directly:

159. assistant (2026-07-02T06:11:33.390Z)

[/external_agent_tool_call]
```

200. assistant (2026-07-02T06:11:33.393Z)

```
[external_agent_tool_result]
frame= 7968 fps=253 q=22.0 size= 396288KiB time=00:02:12.88 bitrate=24430.5kbits/s speed=4.23x
elapsed=0:00:31.44
frame= 8130 fps=254 q=22.0 size= 404224KiB time=00:02:15.58 bitrate=24423.0kbits/s speed=4.24x
elapsed=0:00:31.97
[/external_agent_tool_result]
```

201. assistant (2026-07-02T06:11:33.393Z)

The GPU transcode is ripping along at ****254 fps (4.2× realtime)**** ? the proxy will be ready in ~3 minutes. The runner is already updated for the split flow: index the 1080p proxy, stitch the final reel from the original 4K (timestamps transfer 1:1 ? same timeline). I'll relaunch the pipeline the moment the transcode lands.

202. user (2026-07-02T06:11:33.393Z)

and show me a log file which when refreshed I can see the tail
You become unresponsive and I want to see the logs
Can you keep merging the PRs which you identify as good engineering fixes. like the API option.
definitely
But make sure to stitch the video from the original and not the compressed. And also check if
this is the behaviour and fix if not

203. assistant (2026-07-02T06:11:33.393Z)

Got it on all three: (1) I'll give you a live-tailable log path, (2) merge authorization for
good engineering fixes noted ? and I'll ship the API `min\_shot\_count` enforcement now, (3) the
stitch **is** from the 4K original ? I'll show you the exact line and verify the output
resolution when the reel lands.

First, checking the transcode and relaunching the pipeline:

204. assistant (2026-07-02T06:11:33.393Z)

```
[external_agent_tool_call: PowerShell]
description: Check transcode completion and proxy file
command: Get-Content C:\Users\avidu\Projects\badminton-highlight-

Only the two intended files staged (`config.json` run-config stays local). Committing and opening the PR:

224. assistant (2026-07-02T06:11:33.395Z)

```
[external_agent_tool_call: PowerShell]
description: Commit, push, and open PR for API min_shot_count enforcement
command: cd C:\Users\avidu\Projects\badminton-highlight-indexer && git commit -m '@'
feat(api): enforce stitching.min_shot_count on /api/compile
```

The config shot-count floor was honored only by the offline runner (run_process_and_stitch.py); /api/compile stitched whatever segment_ids the caller picked, so config.json stitching.min_shot_count was silently ignored on the live API path (owner-requested parity, 2026-06-12).

Semantics: segments whose metadata carries a shot_count below the floor are dropped (logged); segments WITHOUT shot_count metadata are exempt so explicitly requested manual/legacy segments cannot silently vanish under the default floor of 1 (every live segmenter always writes shot_count). All matching segments below the floor -> 400 with the floor in the detail.

Tests: floor drops a below-floor segment while keeping above-floor and no-metadata segments; all-below-floor returns 400.

Suite: 407 passed; ruff clean.

Co-Authored-By: Claude Fable 5 <noreply@anthropic.com>

```
'@ && git push -u origin feat/api-min-shot-count && gh pr create --title "feat(api): enforce stitching.min_shot_count on /api/compile" --body @'
```

What

`stitching.min\_shot\_count` was honored only by the offline runner (`run\_process\_and\_stitch.py`); `/api/compile` stitched exactly the `segment\_ids` given, silently ignoring the configured shot-count floor. Owner requested parity (2026-06-12): the API path now applies the floor.

Semantics

- Segments whose metadata has `shot\_count < min\_shot\_count` are **dropped** (count logged).
- Segments **without** `shot\_count` metadata are **exempt** ? explicitly requested manual/legacy segments must not silently vanish under the default floor of 1. Every live segmenter (gemini, wasb/tracknet/yolo hybrids, motion) always writes `shot\_count`, so the floor bites exactly where intended.
- If **all** matching segments fall below the floor ? `400` naming the floor value.

Verification

- New tests: mixed below/above/no-metadata segments ? only the below-floor one is dropped; all-below-floor ? 400.
- `python run\_all\_tests.py`: **407 passed**; ruff clean.

Per owner authorization (2026-06-12), this will be merged on green CI as a good-engineering-fix PR.

239. assistant (2026-07-02T06:11:33.396Z)

Status on all three of your asks, plus the run:

```
**1. Live log** ? open or tail this file; ``-wait`` streams updates so you don't even need to
refresh:
```powershell
Get-Content -Wait -Tail 30 C:\Users\avidu\Projects\badminton-highlight-
indexer\output\gx010125_run.log
```
```

Every phase, every per-rally KEEP/drop decision with its shot count, and the final reel path all land there. If I ever go quiet, that file is the source of truth (the WASB trajectory CSV also appears under `output\wasb\` when phase 2 completes).

****2. Merging good engineering fixes ? done and recorded.**** The API option is shipped: [PR #107](https://github.com/avidullu/badminton-highlight-indexer/pull/107) (`/api/compile` now enforces `stitching.min\_shot\_count`; segments with a known below-floor shot count are dropped, segments lacking shot-count metadata pass so explicitly chosen ids can't silently vanish; all-below-floor ? 400). CI 4/4 green, squash-merged to master. I also saved the new working agreement to memory ? future sessions will merge verified engineering fixes on green CI, while product/strategy/licensing changes stay yours.

****3. Stitch from the original ? verified, it's the behavior.**** The runner indexes the proxy but compiles from the 4K source: `compile\_highlights(SOURCE\_PATH, ?)` where `SOURCE\_PATH` is your `F:\?\GX010125.MP4` ? the proxy is never touched at stitch time. Timestamps transfer 1:1 since both share the same timeline. As a hard check, I'll `ffprobe` the finished reel and confirm it's 3840x2160 HEVC-sourced footage before calling it done.

****Run progress:**** WASB is extracting/inferring at ~17 fps on the 1080p proxy (vs ~5 fps on 4K) ? ~4,950 of ~46,000 frames done. ETA: trajectory pass ~40 more minutes, then Gemini confirmation of the candidate rallies, then the >7-shot filter and the 4K stitch. I'll report when the kept-rally list and the reel land.

```

251. assistant (2026-07-02T06:11:33.396Z)

Relaunched (config now `timeout\_sec: 7200`). The cached 30k frames mean the trajectory pass should finish in roughly **20?25 minutes** instead of 45. Same log file for your live view ? it restarted from the top:

```
```powershell
Get-Content -Wait -Tail 30 C:\Users\avidu\Projects\badminton-highlight-
indexer\output\gx010125_run.log
```
```

What happened, for the record: the 30-min WASB ceiling (`indexing.wasb.timeout\_sec: 1800`) was tuned for the shorter eval corpus videos ? a 12.8-min 4K60 GoPro file is a new envelope for this pipeline. The timeout killed inference cleanly, the pipeline correctly reported "0 segments" rather than corrupting anything, and the crash-cache preserved all extracted frames. I'll report at the next milestone (trajectory ? candidate windows ? Gemini confirmations ? filter ? 4K stitch).

252. user (2026-07-02T06:11:33.396Z)

```
<task-notification>
<task-id>bwiwctgbr</task-id>
<summary>Monitor event: "GX010125 proxy-run milestones (phases, kept rallies, errors)"</summary>
<event>[CONFIG] segmenter=wasb_hybrid | min_shot_count=8 | begin_padding=0.5s end_padding=0.5s |
watermark=on
[HASH] computing MD5 of the 1080p proxy...</event>
If this event is something the user would act on now, send a PushNotification. Routine or benign
output doesn't need one.
</task-notification>
```

253. assistant (2026-07-02T06:11:33.397Z)

Run restarted cleanly ? hashing the proxy now. Next meaningful milestone will be the WASB trajectory completing (~20?25 min). I'll stay quiet until then unless something breaks.

254. user (2026-07-02T06:11:33.397Z)

```
<task-notification>
<task-id>bwiwctgbr</task-id>

275. assistant (2026-07-02T06:11:33.398Z)

The diagnosis is clear: it's now **13:52 on June 13** but the run froze at **23:01 last night (June 12)** ? the log never advanced past "Running WASB inference," the Python parent is gone, the WSL process is gone, and the frame cache is frozen at 30,087 (exactly where it stalled). This is the **overnight machine-suspend kill** ? a known failure mode in this project's history ("idle/suspend KILLS background runs silently"). The machine slept overnight and took both processes with it.

The good news: the 30,087-frame crash-cache survived. Let me confirm the suspend theory and understand the runner's resume behavior before relaunching robustly.

276. assistant (2026-07-02T06:11:33.398Z)

[external_agent_tool_result]
1      ""WASB shuttle-trajectory runner (WSL2 subprocess adapter).
2
3      Windows-side counterpart to backend/detectors/wasb_infer.py. It:
4          1. stages the video into the WSL filesystem (fast local reads, not /mnt),
5          2. copies wasb_infer.py into the WASB repo's src/ dir,
6          3. runs it in the WSL `wasb` conda env -> a Frame,Visibility,X,Y trajectory CSV,
7          4. reuses the (model-agnostic) trajectory->action-window logic from tracknet_runner.
8
9      So the only WASB-specific bits live here; the windowing + CSV parsing are shared
10     with the TrackNet path. Verified inference core: wasb_infer.py (see its docstring).

```

88     [/external_agent_tool_result]

```

280. assistant (2026-07-02T06:11:33.399Z)

Key finding: power settings show **sleep is disabled** (`STANDBYIDLE = 0` on both AC/DC), yet the WSL filesystem remounted at 9:53 AM today (a fresh WSL VM start ? consistent with an overnight reboot or WSL teardown). Python orchestrator gone with no timeout logged = abrupt kill, not a clean failure. Regardless of exact cause (reboot/hibernate/WSL teardown), the fix is the same: rerun, but first I need to understand the runner's resume behavior so I don't waste 45 minutes re-extracting frames. Let me read the inference wrapper.

[external_agent_tool_result]
1     """WASB shuttle-trajectory inference on an arbitrary frame sequence (runs in WSL).
2
3     WASB-SBDT only ships *dataset* evaluation; this is a thin wrapper that reuses its
4     own building blocks (ImageDataset transform + detector + online tracker) to run on
5     any folder of extracted frames and emit a trajectory CSV in the exact shape the
6     indexer's `tracknet_runner.parse_trajectory_csv` already consumes:
7
8         Frame,Visibility,X,Y
9
10    It must run INSIDE the WSL `wasb` conda env, from the WASB-SBDT `src/` dir (it
11    imports WASB's `detectors`/`trackers`/`dataloaders`). The Windows-side adapter
12    (`wasb_runner.py`) stages this file + the frames into WSL and invokes it.
13
14    Resumable across reboots
15    -----
16    The GPU detector pass (one forward per sliding window ? ~21k for a 6-min clip) is
17    the slow, expensive part; the CPU tracker pass that turns detections into a
18    trajectory is cheap and *stateful* (it must see every frame in order, so it can't
19    resume mid-stream). We exploit that split:
20
21    * The detector pass writes its per-window raw outputs incrementally to
22      ``<cache>/det_raw.jsonl`` (flushed+fsync'd every ``--flush-every`` windows) and
23      records progress in ``<cache>/manifest.json`` (atomic write). A reboot loses at
24      most ``--flush-every`` windows of GPU work instead of the whole pass.
25    * On restart we replay the cached windows, skip the DataLoader ahead to the first
26      un-cached window, and continue. Once every window is cached, the detector pass
27      is skipped entirely and we just re-run the (cheap, deterministic) tracker over
28      the full ordered cache -> trajectory CSV. So a lost trajectory CSV costs seconds,
29      not the GPU hour.

```

```

30
31     The cache is keyed by the output path (`<out>_wasbcache/` by default), lives next
32     to the output (NOT in %TEMP%), and is invalidated automatically if the frames dir,
33     weights, sport, window size, or frame count change.
34
35     Usage (in WSL, from ~/models/WASB-SBDT/src):
36         python wasb_infer.py --frames_dir /path/frames --weights
37         ../pretrained_weights/wasb_badminton_best.pth.tar \
38         --out /path/traj.csv [--sport badminton] [--limit N] [--cache-dir DIR] [--flush-
39         every 1000] [--fresh]

285. assistant (2026-07-02T06:11:33.399Z)

Now I have the real root cause. Let me lay out what the evidence shows:

```
- **No reboot** (last boot June 11) and **no sleep (S3) events** ? but a chain of `Kernel-Power`  
**session transitions** ("transitioned from 51 to 52", reasons `InputHid`/\`SessionUn`) around  
22:53 last night. That's **Modern Standby (connected standby)**: when the machine sits idle with  
the screen off, Windows enters S0 low-power and the **Desktop Activity Moderator suspends Win32  
processes and pauses the WSL2 VM**. That froze the Python orchestrator and the WSL inference  
mid-run ? no clean exit, no timeout logged, frame cache frozen at exactly 30,087. `standby-  
timeout=0` doesn't prevent this; Modern Standby is screen-off-triggered.
```

The crucial good news from reading `wasb\_infer.py`: the **GPU detector pass is checkpointed and resumable** (`det\_raw.jsonl` + manifest, fsync'd every 1000 windows), and frame extraction is idempotent once complete. The killer was purely the machine idling ? not a code bug.

Let me gather the exact numbers I need to choose the fastest extraction path, and install a keep-awake so this can't happen again.

286. assistant (2026-07-02T06:11:33.399Z)

292. assistant (2026-07-02T06:11:33.400Z)

The wake-lock call ****succeeded**** (``SetThreadExecutionState`` returned the prior state) ? but the job then exited, which releases the lock, and ``powercfg /requests`` tripped the exit code by needing admin. I need a **persistent** process to hold the lock. Let me fix that, and re-probe the frame metrics cleanly (the comma broke PowerShell's parser). Writing a small probe script avoids the nested-quote hell.

302. assistant (2026-07-02T06:11:33.400Z)

PNG_COUNT=0 is a false reading ? `ls \*.png` with 30k files overflows ARG_MAX; the dir is **63 GB of ~2.3 MB PNGs** (?30,087 frames, confirmed by the sample file). Free space 766 G ? plenty. So the prior run died **during cv2 frame extraction, before GPU inference ever started** (no `det\_raw.jsonl` cache existed) ? extraction is the long pole, exactly as `wasb\_infer.py`'s own

docstring warns ("cv2 PNG extraction is slow; for big clips prefer ffmpeg").

Let me get cv2's exact expected count (the number `extract\_frames` checks against) so I can pre-extract with ffmpeg safely, and check the ffprobe result:

303. assistant (2026-07-02T06:11:33.400Z)

```
[external_agent_tool_call: Read]

[external_agent_tool_call: Write]
file: C:\Users\avidu\Projects\badminton-highlight-indexer\scratch\probe_cv2_count.py
[/external_agent_tool_call]
```

306. assistant (2026-07-02T06:11:33.401Z)

```
[external_agent_tool_result]
File created successfully at: C:\Users\avidu\Projects\badminton-highlight-indexer\scratch\probe_cv2_count.py (file state is current in your context ? no need to Read it back)
[/external_agent_tool_result]
```

307. assistant (2026-07-02T06:11:33.401Z)

ffprobe is still counting (it decodes every frame). Let me probe cv2's count directly in the WSL `wasb` env ? that's the exact number `extract\_frames` will check against, on the staged video:

308. assistant (2026-07-02T06:11:33.401Z)

```
[external_agent_tool_call: PowerShell]
description: Probe cv2 frame count of staged proxy in wasb env
command: wsl -d Ubuntu -- bash -lc "source ~/miniconda3/etc/profile.d/conda.sh; conda activate wasb; python /mnt/c/Users/avidu/Projects/badminton-highlight-indexer/scratch/probe_cv2_count.py /home/avidullu/clips/GX010125_1080p__89605e80ed01.mp4"
[/external_agent_tool_call]
```

309. assistant (2026-07-02T06:11:33.401Z)

```
[external_agent_tool_result]
CAP_PROP_FRAME_COUNT 46080
FPS 59.94005994005994
[/external_agent_tool_result]
```

310. assistant (2026-07-02T06:11:33.401Z)

cv2 expects exactly ****46080 frames**** (and the math is clean: $768.768s \times 59.94 \text{ fps} = 46080$ exactly, CFR ? so ffmpeg will produce precisely that count, perfectly aligned with cv2's indexing). That makes ffmpeg pre-extraction safe and removes the long pole: I'll extract all 46080 PNGs with ffmpeg natively inside WSL (fast ext4 disk, ~8 min) so the pipeline's slow cv2 extraction is skipped entirely, going straight to GPU inference (which is itself resumable).

Let me wipe the partial 30k and extract fresh:

311. assistant (2026-07-02T06:11:33.401Z)

```
[external_agent_tool_call: PowerShell]
description: Extract all proxy frames to PNG natively in WSL

```

318. assistant (2026-07-02T06:11:33.401Z)

Good ? ffmpeg is extracting cleanly at ~52 fps, and I've confirmed the stitch line cuts from the **4K original** (`SOURCE\_PATH`), not the proxy. Here's the full picture:

What happened overnight

It wasn't a code bug ? it was the **machine, twice**. The Kernel-Power event log shows **Modern Standby (connected standby)** transitions around 22:53 last night. When the machine sits idle with the screen off, Windows enters S0 low-power and **suspends Win32 processes and pauses the WSL2 VM**. That froze the Python orchestrator + WSL inference mid-run, with no clean exit (which is exactly why you saw no error ? the log just stopped at "Running WASB inference" and the frame cache froze at 30,087). Note `standby-timeout=0` does **not** prevent this; Modern Standby is screen-off-triggered.

I also discovered **why it kept dying at the same place**: the run **never even reached the GPU** ? it was still in **cv2 frame extraction** (the slow part ? `wasb_infer.py`'s own docstring warns "cv2 PNG extraction is slow; for big clips prefer ffmpeg"). 46,080 frames at ~20 fps via cv2 = ~38 min of fragile single-threaded extraction, and standby kept killing it before inference began.

Fixes applied

- Root cause ? keep-awake.** A persistent wake-lock process (`SetThreadExecutionState(ES_SYSTEM_REQUIRED|ES_DISPLAY_REQUIRED)`), re-asserted every 60s) is now holding the machine in S0 working state so standby can't suspend the run.
- The bottleneck ? ffmpeg pre-extraction.** Extracting all 46,080 PNGs with ffmpeg natively inside WSL right now (~15 min, running). The frame count is provably exact ($768.768s \times 59.94fps = 46,080$, CFR ? matches cv2's count precisely), so the pipeline's slow cv2 step is **skipped entirely** and it goes straight to GPU inference (which is itself checkpointed/resumable).
- Stitch-from-original ? confirmed.** The runner indexes the 1080p proxy but cuts the final reel from `F:\?\GX010125.MP4` (the 4K original) ? same timeline, so timestamps transfer 1:1. I'll `ffprobe` the output to confirm it's 3840x2160 before calling it done.

Also: the **API `min_shot_count` fix you authorized is merged** ([#107](https://github.com/avidullu/badminton-highlight-indexer/pull/107)), squashed to master on green CI).

What's next (automatic)

When extraction finishes (~15 min), I'll launch the pipeline ? it'll skip extraction ? **GPU WASB inference** ? candidate windows ? **Gemini rally confirmation** (serial, your API key's in `.env`) ? **filter to `shot_count > 7`** ? **stitch from 4K**. ETA after extraction: ~30?50 min. The live log stays at:

```
```powershell
Get-Content -Wait -Tail 40 C:\Users\avidu\Projects\badminton-highlight-indexer\output\gx010125_run.log
```
```

I'll report at each milestone and won't go idle on you.

1      --- ffmpeg exact decoded frame count (proxy) ---  
2      avg_frame_rate=60000/1001  
3      nb_read_frames=46080  
4  
[/external_agent_tool_result]
```

322. assistant (2026-07-02T06:11:33.402Z)

Confirmed: ffmpeg's exact decoded count is **46080** ? matching cv2's `CAP_PROP_FRAME_COUNT` precisely. So the ffmpeg pre-extraction will produce exactly the count the pipeline expects, and the slow cv2 step will be skipped. Extraction is running (~15 min). I'll launch the pipeline the moment it completes.

323. user (2026-07-02T06:11:33.402Z)

```

```

334. assistant (2026-07-02T06:11:33.403Z)

```
[external_agent_tool_result]
Monitor started (task b53194x5t, persistent ? runs until TaskStop or session end). You will be
notified on each event. Keep working ? do not poll or sleep. Events may arrive while you are
waiting for the user ? an event is not their reply.
[/external_agent_tool_result]
```

335. assistant (2026-07-02T06:11:33.403Z)

Pipeline relaunched (`b09gv8s9s`) with a fresh milestone monitor. This run should sail past the extraction step (frames pre-staged, count-verified 46080) straight into ****GPU WASB inference**** ? the part that never got to run before. The keep-awake lock is holding the machine in working state so standby can't interrupt it.

Live log as always:

```
```powershell
Get-Content -Wait -Tail 40 C:\Users\avidu\Projects\badminton-highlight-
indexer\output\gx010125_run.log
```

...  
I'll report when inference progress appears (the `win/s` / `% | ETA` lines from the detector pass), then at trajectory completion, Gemini confirmation, the >7-shot filter, and the final 4K stitch.

**336. user (2026-07-02T06:11:33.403Z)**

```

</task-notification>
```

**341. assistant (2026-07-02T06:11:33.403Z)**

GPU healthcheck passed. Important heads-up about visibility: the WASB inference runs as a \*subprocess inside WSL\*, so its progress logs are captured by the subprocess and \*\*won't appear in the live run log until it finishes\*\* ? that's precisely the "goes unresponsive" window you flagged. But `wasb\_infer.py` writes incremental progress to a checkpoint manifest on disk. Let me set up a monitor that polls that manifest so we both get live GPU inference progress:

**342. assistant (2026-07-02T06:11:33.403Z)**

```
[external_agent_tool_call: Monitor]
```

```
description: WASB GPU detector progress via checkpoint manifest
command: cache="/c/Users/avidu/Projects/badminton-highlight-
indexer/output/wasb/GX010125_1080p__89605e80ed01_wasb_wasbcache/manifest.json";
csv="/c/Users/avidu/Projects/badminton-highlight-
indexer/output/wasb/GX010125_1080p__89605e80ed01_wasb.csv"; prev=""; waited=0; while true; do if
[-f "$csv"]; then echo "WASB trajectory CSV WRITTEN -> detector+tracker done"; break; fi; if [
-f "$cache"]; then cur=$(grep -o '"windows_done"[:]*[0-9]*' "$cache" | grep -o '[0-9]*$');
tot=$(grep -o '"windows_total"[:]*[0-9]*' "$cache" | grep -o '[0-9]*$'); if [-n "$cur"] && [
"$cur" != "$prev"]; then pct=$((cur*100/(tot>0?tot:1))); echo "WASB detector: $cur/$tot
windows (${pct}%)"; prev=$cur; fi; else waited=$((waited+20)); if [$((waited%120)) -eq 0];
then echo "waiting for detector cache to appear (${waited}s)..."; fi; fi; sleep 20; done
[/external_agent_tool_call]
```

#### 343. assistant (2026-07-02T06:11:33.404Z)

```
[external_agent_tool_result]
Monitor started (task bnl9fplws, persistent ? runs until TaskStop or session end). You will be
notified on each event. Keep working ? do not poll or sleep. Events may arrive while you are
waiting for the user ? an event is not their reply.
[/external_agent_tool_result]
```

#### 344. assistant (2026-07-02T06:11:33.404Z)

Now I have two monitors running: the run-log milestone watcher (`b53194x5t`) and the GPU detector-progress watcher (`bnl9fplws`) polling the checkpoint manifest. Between them, you'll see live progress through the whole inference phase ? no more silent gaps. I'll report as the detector windows tick up and at each phase transition.

#### 345. user (2026-07-02T06:11:33.404Z)

```
<task-notification>
<task-id>bnl9fplws</task-id>
<summary>Monitor event: "WASB GPU detector progress via checkpoint manifest"</summary>
<event>WASB detector: 0/46078 windows (0%)</event>
If this event is something the user would act on now, send a PushNotification. Routine or benign
output doesn't need one.
</task-notification>
```

#### 346. assistant (2026-07-02T06:11:33.404Z)

Inference is **live on the GPU** ? and this confirms the optimization worked:  
`windows\_total=46078` with `windows\_done=0` means extraction was skipped entirely (frames\_in=3, so 46080-2=46078 sliding windows). The run went straight to the detector pass that never got to start in any prior attempt.

The checkpoint updates every 1000 windows, so the next ticks will let me estimate the rate and give you a real ETA. The GPU phase is now visible in real time via the manifest monitor.

#### 347. user (2026-07-02T06:11:33.404Z)

```
<task-notification>
<task-id>bnl9fplws</task-id>
<summary>Monitor event: "WASB GPU detector progress via checkpoint manifest"</summary>
<event>WASB detector: 1000/46078 windows (2%)</event>
If this event is something the user would act on now, send a PushNotification. Routine or benign
output doesn't need one.
</task-notification>
```

#### 348. assistant (2026-07-02T06:11:33.404Z)

Progress is flowing (2%). Let me grab one timestamped anchor so I can compute the actual throughput and give you a real ETA (the per-window rate isn't in the manifest):

#### 349. assistant (2026-07-02T06:11:33.404Z)

```
[external_agent_tool_call: PowerShell]
description: Anchor timestamp + manifest progress + GPU utilization
command: $now = Get-Date; $m = "C:\Users\avidu\Projects\badminton-highlight-
indexer\output\wasb\GX010125_1080p__89605e80ed01_wasb_wasbcache\manifest.json"; $mt = (Get-Item
$m).LastWriteTime; $done = (Get-Content $m | ConvertFrom-Json).windows_done; $tot = (Get-Content
$m | ConvertFrom-Json).windows_total; Write-Output "now=$now manifest_mtime=$mt
windows_done=$done windows_total=$tot"; nvidia-smi --query-
gpu=utilization.gpu,memory.used,power.draw --format=csv,noheader 2>$null
[/external_agent_tool_call]
```

### 350. assistant (2026-07-02T06:11:33.404Z)

```
[external_agent_tool_result]
now=06/13/2026 14:18:23 manifest_mtime=06/13/2026 14:18:20 windows_done=2000 windows_total=46078
78 %, 5188 MiB, 73.88 W
[/external_agent_tool_result]
```

### 351. assistant (2026-07-02T06:11:33.404Z)

Solid anchor: **\*\*2000 windows by 14:18:20\*\***, GPU at 78% util / 5.2 GB VRAM / 74 W ? healthy and steady. That's roughly **\*\*~25 windows/sec\*\***, so the detector pass (46,078 windows) should finish in **\*\*~30 minutes, around 14:47?14:50\*\***.

After that the sequence is quick ? variable:

- **\*\*Tracker pass\*\*** (CPU, deterministic) ? seconds ? writes the trajectory CSV.
- **\*\*Candidate windowing\*\*** ? instant ? turns the trajectory into candidate rallies.
- **\*\*Gemini confirmation\*\*** ? the next variable phase: each candidate rally gets uploaded to Gemini (serial, ``ai_max_workers=1``) for semantic boundary + shot-count confirmation. Length depends on how many candidates WASB finds.
- **\*\*Filter to shot\_count > 7\*\***, then **\*\*stitch from the 4K original\*\***, then I ``ffprobe`` the reel to confirm 3840x2160.

The detector progresses in the chat via the manifest monitor, so you'll see it tick toward 46,078. I'll flag the trajectory-complete and Gemini phases as they hit.

### 352. user (2026-07-02T06:11:33.405Z)

```
<task-notification>
<task-id>bnl9fplws</task-id>
<summary>Monitor event: "WASB GPU detector progress via checkpoint manifest"</summary>
<event>WASB detector: 2000/46078 windows (4%)</event>
If this event is something the user would act on now, send a PushNotification. Routine or benign
output doesn't need one.
</task-notification>
```

### 353. assistant (2026-07-02T06:11:33.405Z)

Tracking as expected (4%). I'll go quiet through the routine detector ticks ? you'll see them stream in the chat ? and speak up at trajectory completion, the Gemini phase, or if anything looks off.

### 354. user (2026-07-02T06:11:33.405Z)

```
<task-notification>
<task-id>bnl9fplws</task-id>
<summary>Monitor event: "WASB GPU detector progress via checkpoint manifest"</summary>
<event>WASB detector: 3000/46078 windows (6%)</event>
If this event is something the user would act on now, send a PushNotification. Routine or benign
output doesn't need one.
</task-notification>
```

### 355. assistant (2026-07-02T06:11:33.405Z)

(6% ? routine; holding for the next milestone.)

### 356. user (2026-07-02T06:11:33.405Z)

```
<task-notification>
<task-id>bnl9fplws</task-id>
<summary>Monitor event: "WASB GPU detector progress via checkpoint manifest"</summary>
<event>WASB detector: 4000/46078 windows (8%)</event>
If this event is something the user would act on now, send a PushNotification. Routine or benign
output doesn't need one.
</task-notification>
```

### 357. assistant (2026-07-02T06:11:33.405Z)

These per-1000 ticks are more notification noise than signal. Let me make the monitor coarser (every ~10%) so it reports meaningfully without spamming, while still catching completion and errors:

### 358. assistant (2026-07-02T06:11:33.405Z)

```
[external_agent_tool_call: TaskStop]
input: {"task_id":"bnl9fplws"}
[/external_agent_tool_call]
```

### 359. assistant (2026-07-02T06:11:33.405Z)

```

```

output doesn't need one.  
</task-notification>

### 370. assistant (2026-07-02T06:11:33.406Z)

(30% ? tracking steady, no issues. ETA refresh at the halfway point.)

### 371. user (2026-07-02T06:11:33.406Z)

<task-notification>  
<task-id>bq5a7u7db</task-id>  
<summary>Monitor event: "WASB detector progress (every ~10%) + completion"</summary>  
<event>WASB detector: 19000/46078 windows (40%)</event>  
If this event is something the user would act on now, send a PushNotification. Routine or benign output doesn't need one.  
</task-notification>

### 372. assistant (2026-07-02T06:11:33.406Z)

We're at 40% and the next phase (Gemini confirmation) is historically the flakier one ? past sessions hit 429/503 waves. Let me use this GPU wait productively and \*\*pre-flight the Gemini path now\*\*, so we don't discover a dead key or empty credits \*after\* 30 minutes of inference. Checking how the provider authenticates and testing connectivity:

### 373. assistant (2026-07-02T06:11:33.406Z)

[external\_agent\_tool\_call: Grep]  
input: {"pattern":"getenv|environ|api\_key|API\_KEY|genai\\.|Client\\(|","path":"C:\\Users\\avidu\\Projects\\badminton-highlight-indexer\\backend\\providers\\gemini.py","output\_mode":"content","-n":true,"head\_limit":30}  
[/external\_agent\_tool\_call]

### 374. assistant (2026-07-02T06:11:33.406Z)

[external\_agent\_tool\_result]  
18: def \_\_init\_\_(self, api\_key: str, model\_name: str):  
19: super().\_\_init\_\_(api\_key, model\_name)  
26: self.\_client = genai.Client(api\_key=self.api\_key)  
[/external\_agent\_tool\_result]

### 375. assistant (2026-07-02T06:11:33.406Z)

[external\_agent\_tool\_call: PowerShell]  
description: Check which API key vars are defined in .env (names only)  
command: \$envf = "C:\\Users\\avidu\\Projects\\badminton-highlight-indexer\\.env"; if (Test-Path \$envf) { \$keys = Select-String -Path \$envf -Pattern "GEMINI|GOOGLE|API" | ForEach-Object { (\$\_.Line -split '=')[0] }; Write-Output "env keys present: \$(\$keys -join ', ')" } else { Write-Output ".env NOT FOUND" }  
[/external\_agent\_tool\_call]

### 376. assistant (2026-07-02T06:11:33.407Z)

[external\_agent\_tool\_result]  
env keys present: GEMINI\_API\_KEY  
[/external\_agent\_tool\_result]

### 377. assistant (2026-07-02T06:11:33.407Z)

`GEMINI\_API\_KEY` is present and the provider uses `genai.Client`. Let me verify it actually authenticates and has quota ? a free `models.list` call (no generation cost), via a small script to avoid quoting issues:

### 378. assistant (2026-07-02T06:11:33.407Z)

```
[external_agent_tool_call: Write]
file: C:\Users\avidu\Projects\badminton-highlight-indexer\scratch\probe_gemini.py
[/external_agent_tool_call]
```

**379. assistant (2026-07-02T06:11:33.407Z)**

```
[external_agent_tool_result]
File created successfully at: C:\Users\avidu\Projects\badminton-highlight-indexer\scratch\probe_gemini.py (file state is current in your context ? no need to Read it back)
[/external_agent_tool_result]
```

**380. assistant (2026-07-02T06:11:33.407Z)**

```
[external_agent_tool_call: PowerShell]
description: Preflight Gemini API connectivity and model availability
command: cd C:\Users\avidu\Projects\badminton-highlight-indexer && python scratch\probe_gemini.py
[/external_agent_tool_call]
```

**381. assistant (2026-07-02T06:11:33.407Z)**

```
[external_agent_tool_result]
key present: ...ZHeX2Q (len 53)
models.list OK: 55 models
gemini-flash-latest available: True -> ['models/gemini-flash-latest']
[/external_agent_tool_result]
```

**382. assistant (2026-07-02T06:11:33.407Z)**

**\*\*Gemini preflight passed\*\*** ? key authenticates (55 models visible), `gemini-flash-latest` available. So the confirmation phase won't hit a dead key; if it meets the usual 503 capacity waves, the provider already has 6-attempt backoff. That de-risks the next phase.

Detector is ~40% and on pace ? trajectory completion still looks like **\*\*~14:48\*\***. After it: tracker ? candidate windows ? Gemini confirmation (now verified ready) ? >7-shot filter ? 4K stitch. Holding until ~50% or trajectory completion.

**383. user (2026-07-02T06:11:33.407Z)**

```
<task-notification>

### 397. assistant (2026-07-02T06:11:33.409Z)

Trajectory CSV is written (detector monitor closed cleanly). Now the key observability insight for Phase 3: looking at the code (lines 226?236), **\*\*segments are only written to the DB in Phase 4, \*after\* all 18 Gemini calls finish\*\*** ? so the DB won't show incremental progress. The reliable live signal is the per-window handoff clip: each candidate extracts ``handoff_<id>_<wi>.mp4``, processes it, deletes it (lines 205?223). Let me watch that directory so we see Gemini tick through the 18 windows:

### 398. assistant (2026-07-02T06:11:33.409Z)

```

[external_agent_tool_call: Monitor]
description: Gemini Phase 3 per-window progress via handoff dir
command: hd="/c/Users/avidu/Projects/badminton-highlight-indexer/output/chunks_gemini_handoff";
last=-1; gone=0; while true; do if [-d "$hd"]; then f=$(ls "$hd"/handoff_*.mp4 2>/dev/null |
sed -E 's/.*_([0-9]+)\.mp4/\1/' | sort -n | tail -1); if [-n "$f"] && ["$f" != "$last"];
then echo "Gemini confirming candidate window $((f+1))/18"; last=$f; fi; gone=0; else
gone=$((gone+15)); if ["$last" -ge 0] 2>/dev/null && [$gone -ge 15]; then echo "Phase 3
handoff dir gone -> Gemini phase finishing"; break; fi; fi; sleep 15; done
[/external_agent_tool_call]

```

### 399. assistant (2026-07-02T06:11:33.409Z)

```

[external_agent_tool_result]
Monitor started (task b9hizl8yk, persistent ? runs until TaskStop or session end). You will be
notified on each event. Keep working ? do not poll or sleep. Events may arrive while you are
waiting for the user ? an event is not their reply.
[/external_agent_tool_result]

```

### 400. assistant (2026-07-02T06:11:33.409Z)

Visibility for Phase 3 is now wired up. Two monitors active:

- **\*\*Per-window Gemini progress\*\*** (`b9hizl8yk`) ? watches the handoff clips, reports "confirming window N/18" as it goes.  
- **\*\*Run-log milestones\*\*** (`b53194x5t`) ? catches "Phase 3 completed", the shot-count filter (KEEP/drop per rally), the final stitch, and any 503/error.

So you'll see Gemini tick through the 18 candidates rather than a silent gap. When Phase 3 finishes you'll get the per-rally shot counts and the >7 filter decisions, then the 4K stitch. Expect ~15?25 min for the Gemini pass.

#### 447. assistant (2026-07-02T06:11:33.413Z)

We have the answer. The `>7-shot` filter kept 11 of 52 rallies\*\* (``min_shot_count=8``, so "more than 7" correctly excludes 7 ? e.g. segment 321 at exactly 7 shots was dropped):

#	Time (4K source)	Shots	Confidence
1	6.8?16.5s	10	Medium
2	26.0?36.0s	10	Medium
3	67.1?85.1s	14	Medium
4	88.6?110.1s	16	Medium
5	180.1?192.6s	11	Medium
6	275.8?282.8s	8	High
7	305.0?316.0s	9	High
8	390.7?398.1s	8	High
9	441.2?451.7s	11	High
10	615.4?627.4s	9	High
11	648.9?661.4s	12	High

\*\*Stitching is running now from the 4K original\*\* (11 clips, ~28s each to re-encode ? ~5 min). The padding fix is visibly working too (``begin_padding=0.5s, end_padding=0.5s`` from config, e.g. 6.8?6.3 / 16.5?17.0).

?? **\*\*One real bug surfaced:\*\*** the default watermark fails on every clip ?  
`fontfile=...assets/fonts/RobotoSlab-Regular.ttf ... Invalid argument` (the bundled-font path from PR #103 doesn't resolve / isn't escaped for ffmpeg on Windows). The compiler's fallback is working correctly ? it re-encodes each clip **\*\*without\*\*** the watermark, so your reel is unaffected ? but the on-by-default branding is silently disabled. Since you didn't ask for branding this doesn't block the result; I'll investigate and propose a fix as a follow-up once the reel lands. Waiting for `[DONE]`, then I'll `ffprobe` to confirm it's true 3840×2160.

#### 461. assistant (2026-07-02T06:11:33.414Z)

Cleanup done; the run is fully complete. Here's the bottom line, then I'll dig into that watermark bug.

## ? Delivered: `output\GX010125\_highlights.mp4`

- **\*\*11 rally highlights, every one with more than 7 shots\*\*** (8?16 shots), drawn from 52 detected rallies in your 12.8-min match.
- **\*\*True 4K\*\***: 3840x2160, h264, 59.94 fps, **\*\*2:23 long\*\***, 1.15 GB ? stitched from the **\*\*original\*\*** `F:\GX010125.MP4` (the 4K resolution is the proof), using config paddings (0.5s/0.5s).
- **\*\*GPU end-to-end\*\***: WASB shuttle-tracking ran on the RTX 2070 Super via WSL (64.8% shuttle visibility), Gemini confirmed rally boundaries + shot counts, the config `min\_shot\_count=8` filter selected ">7".

**\*\*On reliability\*\*** the two overnight failures were Modern Standby suspending the machine, not the code ? the keep-awake lock fixed that, and ffmpeg pre-extraction (replacing the slow cv2 path that was actually where it kept dying) got the full run through in one pass.

Now let me diagnose that watermark font bug properly ? it's a real defect worth a fix under your "merge good engineering fixes" standing:

```

#### 464. assistant (2026-07-02T06:11:33.414Z)

The root cause is clear from the code. `textfile=` uses a path under `tmp\_dir` (relative `output/tmp?` ? no drive letter), which is why text never errored. But `\_BUNDLED\_FONT` (added in PR #103) is an **absolute** path `C:\?\RobotoSlab-Regular.ttf` ? `\_ff\_quote` turns it into `C:/?` and the **drive-letter colon** breaks ffmpeg's drawtext option parsing\*\* (`:` separates filter options). Let me confirm `\_BUNDLED\_FONT` and reproduce/verify the fix empirically before touching code:

#### 465. assistant (2026-07-02T06:11:33.414Z)

```

[external_agent_tool_call: Grep]
input: {"pattern": "_BUNDLED_FONT", "path": "C:\\Users\\avidu\\Projects\\badminton-highlight-
indexer\\backend\\pipeline\\stitcher\\compiler.py", "output_mode": "content", "-n": true}
[/external_agent_tool_call]

```

#### 466. assistant (2026-07-02T06:11:33.414Z)

```
[external_agent_tool_result]
14:_BUNDLED_FONT = Path(__file__).resolve().parents[2] / "assets" / "fonts" / "RobotoSlab-
Regular.ttf"
136: if not font_path and _BUNDLED_FONT.exists():
137: font_path = str(_BUNDLED_FONT)
[/external_agent_tool_result]
```

#### 467. assistant (2026-07-02T06:11:33.415Z)

```
[external_agent_tool_call: PowerShell]
description: Confirm bundled font file exists
command: $f = "C:\Users\avidu\Projects\badminton-highlight-
indexer\backend\assets\fonts\RobotoSlab-Regular.ttf"; Write-Output "bundled font exists: $(Test-

```

#### 473. assistant (2026-07-02T06:11:33.415Z)

```
[external_agent_tool_result]
CURRENT _ff_quote (raw C:/ colon):
[current] vf=drawtext=text='hi':fontfile='C:/Users/avidu/Projects/badminton-highlight-
indexer/backend/assets/fonts/RobotoSlab-
Regular.ttf':fontcolor=white@0.85:fontsize=20:x=10:y=10:box=1:boxcolor=black@0.50:boxborderw=10
[current] returncode=4294967274 ok=False
[current] stderr tail: /Projects/badminton-highlight-indexer/backend/assets/fonts/RobotoSlab-
Regular.ttf':fontcolor=white@0.85:fontsize=20:x=10:y=10:box=1:boxcolor=black@0.50:boxborderw=10'
around:
```

Error opening output file C:\Users\avidu\AppData\Local\Temp\wm\_current.mp4.

Error opening output files: Invalid argument

```
FIXED _ff_quote (escaped C\:/ colon):
[fixed] vf=drawtext=text='hi':fontfile='C:/Users/avidu/Projects/badminton-highlight-indexer/backend/assets/fonts/RobotoSlab-Regular.ttf':fontcolor=white@0.85:fontsize=20:x=10:y=10:box=1:boxcolor=black@0.50:boxborderw=10
[fixed] returncode=0 ok=True
[/external_agent_tool_result]
```

#### 474. assistant (2026-07-02T06:11:33.415Z)

```
Root cause + fix both confirmed empirically:
- Current (`fontfile='C:/?'`): fails with the *exact* production error (`Invalid argument`,
"around:").
- Fixed (`fontfile='C\:/?'`): returncode 0, works.
```

The drive-letter colon breaks ffmpeg's drawtext option parsing even inside single quotes. The fix is to escape colons in `\_ff\_quote` (which also feeds `textfile=` and the logo `movie=` source). Let me verify the `movie=` operand behaves the same so the shared-helper fix is safe everywhere:

#### 481. assistant (2026-07-02T06:11:33.415Z)

Confirmed ? the `movie=` logo source has the **same** colon bug (fails with parse error on ``C``), and the same escape fixes it. So one fix in the shared `\_ff\_quote` helper correctly repairs all three operands (drawtext `fontfile`, `textfile`, and logo `movie=`). This means absolute logo paths were silently broken on Windows too. Let me read the current exact helper text and apply the fix:

fix(stitcher): escape drive-letter colon in ffmpeg filtergraph paths
```

The on-by-default bundled-font watermark (PR #103) was silently disabled on Windows: `_BUNDLED_FONT` is an absolute path (`C:\...\RobotoSlab-Regular.ttf`), and `_ff_quote` only converted backslashes + escaped single quotes. ffmpeg's filtergraph option parser treats `:` as the option separator EVEN inside single quotes, so `fontfile='C:/...'` truncates the operand at `C` and the per-clip encode fails with "Invalid argument". The compiler's fallback then re-encoded every clip WITHOUT the watermark ? branding off, no error surfaced to the user.

Reproduced + fix verified against real ffmpeg (drawtext fontfile AND the logo movie= source both fail on a raw colon, both succeed with it escaped). Fix: `_ff_quote` also escapes `:` -> `\:`. This repairs all three operands that flow through it (drawtext fontfile, textfile, movie= logo). POSIX paths (incl. the Linux bundled-font path) have no colon, so the change is a no-op there.

Surfaced live during a real GPU highlight run on a 4K GoPro match (12 of 12 clips logged "watermark encode failed; retrying without it").

Tests: `_ff_quote` escapes the drive-letter colon (and handles colon+quote+backslash together); `_watermark_filter` emits `fontfile='C:\:...'` not `'C:/...'`. Suite 409 green; ruff + mypy clean.

Co-Authored-By: Claude Fable 5 <noreply@anthropic.com>

```
'@ && git push -u origin fix/watermark-windows-colon && gh pr create --title "fix(stitcher):
escape drive-letter colon in ffmpeg filtergraph paths" --body '@'
```

### What

The on-by-default bundled-font watermark (added in [#103](https://github.com/avidullu/badminton-highlight-indexer/pull/103)) was **silently disabled on Windows**. `_BUNDLED_FONT` is an absolute path (`C:\?\RobotoSlab-Regular.ttf`), and `_ff_quote` only converted `\`?`/`` and escaped ````. But ffmpeg's filtergraph parser treats `:` as the option separator **even inside single quotes**, so `fontfile='C:/?'` truncates the operand at `C` and the per-clip encode dies with `Invalid argument`. The compiler's graceful fallback then re-encoded every clip **without** the watermark ? so branding was off and no error reached the user.

### Root cause + fix, verified against real ffmpeg

Reproduced with a minimal `drawtext` encode: raw `fontfile='C:/?'` ? `Invalid argument`; escaped `fontfile='C:\:/?'` ? exit 0. Same for the logo `movie='C:/?'` source (fails on `'C'`, succeeds escaped). So absolute logo paths were broken on Windows too.

Fix: `_ff_quote` now also escapes `:` ? `\:`. One change repairs all three operands that flow through it (`drawtext fontfile`, `textfile`, `movie=`). POSIX paths (including the Linux bundled-font path) contain no colon, so it's a no-op there ? and `textfile=` only worked before because its temp path was relative (no drive letter).

### How it surfaced

Live, during a real GPU highlight run on a 4K GoPro match ? all 12 clips logged `watermark encode failed; retrying without it`.

### Tests

- `\_ff\_quote` escapes the drive-letter colon, leaves POSIX paths unchanged, and handles colon+quote+backslash together.
- `\_watermark\_filter` emits `fontfile='C:/?'`, never the raw `C:/?`.
- `python run\_all\_tests.py`: \*\*409 passed\*\*; ruff + mypy clean.

Per standing authorization (2026-06-12), merging good-engineering-fix PRs on green CI.

## 521. assistant (2026-07-02T06:11:33.418Z)

Everything's complete and recorded. Here's the wrap-up.

### ? Your highlights: `output\GX010125\_highlights.mp4`

**\*\*11 rally highlights, every one with more than 7 shots\*\*** (8, 8, 9, 9, 10, 10, 11, 11, 12, 14, 16 shots), selected from 52 rallies detected across your 12.8-minute match.

- **\*\*True 4K, from the original\*\***: 3840x2160 h264 59.94fps, 2:23, 1.15 GB ? cut from `F:\?\GX010125.MP4`, not the proxy (the 4K resolution is the proof). Config paddings applied (0.5s/0.5s).
- **\*\*GPU end-to-end\*\***: WASB shuttle-tracking on your RTX 2070 Super via WSL (64.8% visibility) ? 18 candidate windows ? Gemini confirmed 52 rallies with shot counts ? config `min\_shot\_count=8` filter. A 7-shot rally was correctly dropped, confirming ">7" semantics.

### The config is picked up ? and now enforced everywhere

`stitching.min\_shot\_count` drove the filter (you can see each rally's KEEP/drop in `output\gx010125\_run.log`). I also **\*\*merged [#107](https://github.com/avidullu/badminton-highlight-indexer/pull/107)\*\*** so the **\*\*API path\*\*** (`/api/compile`) enforces the same floor ? previously it ignored the config and stitched whatever segment IDs it was given.

### Two things fixed along the way (both merged on green CI, per your standing authorization)

1. **\*\*[#107](https://github.com/avidullu/badminton-highlight-indexer/pull/107)\*\*** ? API `min\_shot\_count` parity (above).
2. **\*\*[#108](https://github.com/avidullu/badminton-highlight-indexer/pull/108)\*\*** ? a real bug the run surfaced: the on-by-default watermark (bundled font from #103) was **\*\*silently failing on Windows\*\*** ? the absolute font path's drive-letter colon (`C:/`) broke ffmpeg's drawtext parser, so every clip fell back to no-watermark. Fixed by escaping the colon in `\_ff\_quote` (also repaired absolute logo paths). Verified against real ffmpeg, with regression tests.

### Why the earlier attempts died (not a code bug)

**\*\*Modern Standby\*\*** suspended the machine overnight twice, freezing the run mid-inference. Fixed with a keep-awake lock. I also found the actual bottleneck was **\*\*cv2 frame extraction\*\*** (~38 min, where it kept dying ? **\*\*before\*\*** the GPU even started), so I pre-extract with ffmpeg now (count-exact for CFR) and the full run completed in one ~47-min pass. The whole recipe is saved to memory for next time.

### Two notes

- **\*\*`config.json` has local uncommitted changes\*\*** from this run (`default\_segmenter=wasb\_hybrid`, `min\_shot\_count=8`, `wasb.timeout\_sec=7200`). Tell me if you want them reverted to the defaults (gemini / 1 / 1800).
- **\*\*The delivered reel has no watermark\*\*** (it stitched **\*\*before\*\*** #108 landed). If you'd like a

branded version, I can re-stitch ? the 52 rallies are cached in the DB, so it skips all inference/Gemini and just re-cuts the 11 clips (~5 min) now that the watermark works. Want me to?

#### 522. user (2026-07-02T06:11:33.418Z)

Can you reuse the info and make me a new video with shot\_count >= 5 and also before that can you tell me whether we used the 4K video to upload to gemini or 1080p? I also want to see a "flowchart of execution" if you may, where wasb involved, how did we decide to "find the rally end" etc.

#### 523. assistant (2026-07-02T06:11:33.418Z)

Good questions ? let me confirm the upload resolution from the code/DB precisely before answering, and verify the cached data is still there for the new reel.

[/external_agent_tool_result]

```

#### 530. assistant (2026-07-02T06:11:33.419Z)

Both confirmed from the code and DB:

- **Gemini received 1080p, not 4K.** Phase 3 extracts each candidate clip from the proxy that was passed to the segmenter (``extract_video_chunk(video_path=?1080p proxy?, reencode=True)``, no further downscale) ? so the clips uploaded to Gemini were 1080p. The 4K original was touched **only** at the final stitch.
- **Cache is intact** for reuse: video\_id `89605e80?`, status `processed`, **52 rallies cached**, of which **24** have shot\_count ? 5 (so the new reel will be 24 rallies). The 4K source is untouched, so I can re-stitch without re-running WASB or Gemini.

Let me build the flowchart, then kick off the ?5 reel.

modules parameter to load detailed guidance:\n- `diagram` ? SVG flowcharts, structural diagrams,
illustrative diagrams\n- `mockup` ? UI mockups, forms, cards, dashboards\n- `interactive` ?
interactive explainers with controls\n- `chart` ? charts, data analysis, geographic maps
(Chart.js, D3 choropleth)\n- `art` ? illustration and generative art\nPick the closest fit. The
module includes all relevant design guidance.\n\n**Complexity budget ? hard limits:**\n- Box
subtitles: ?5 words. Detail goes in click-through (`sendPrompt`) or the prose below ? not the
box.\n- Colors: ?2 ramps per diagram. If colors encode meaning (states, tiers), add a 1-line
legend. Otherwise use one neutral ramp.\n- Horizontal tier: ?4 boxes at full width (~140px
each). 5+ boxes ? shrink to ?110px OR wrap to 2 rows OR split into overview + detail
diagrams.\n\nIf you catch yourself writing \"click to learn more\" in prose, the diagram itself
must ACTUALLY be sparse. Don't promise brevity then front-load everything.\n\n**Accessibility:**
For HTML widgets, begin with a visually-hidden `<h2 class=\"sr-only\">` containing a one-
sentence summary of the visualization for screen-reader users. (SVG widgets use `role=\"img\"`
with `<title>` and `<desc>` instead ? see SVG setup.)\n\nYou create rich visual content ? SVG
diagrams/illustrations and HTML interactive widgets ? that renders inline in conversation. The
best output feels like a natural extension of the chat.\n\n## Core Design System\n\nThese rules
apply to ALL use cases.\n\n### Philosophy\n- **Seamless**: Users shouldn't notice where
claude.ai ends and your widget begins.\n- **Flat**: No gradients, mesh backgrounds, noise
textures, or decorative effects. Clean flat surfaces.\n- **Compact**: Show the essential inline.
Explain the rest in text.\n- **Text goes in your response, visuals go in the tool** ? All
explanatory text, descripti

```

[/external\_agent\_tool\_call]

### 553. assistant (2026-07-02T06:11:33.420Z)

[external\_agent\_tool\_result]

Monitor started (task bd1qgo1zh, persistent ? runs until TaskStop or session end). You will be notified on each event. Keep working ? do not poll or sleep. Events may arrive while you are waiting for the user ? an event is not their reply.

[/external\_agent\_tool\_result]

### 554. assistant (2026-07-02T06:11:33.420Z)

Both your questions answered, the flowchart is above, and the ?5 reel is now building (reusing cache ? no WASB/Gemini re-run).

## 1. Resolution: Gemini saw **\*\*1080p\*\***, not 4K

The pipeline deliberately splits resolution by stage:

- **\*\*WASB + Gemini operated on the 1080p proxy.\*\*** The candidate clips uploaded to Gemini were ``extract_video_chunk(<1080p proxy>, ?, reencode=True)`` with no further downscaling ? so 1080p reached Gemini. This is the right trade: shot-counting and boundary detection don't need 4K, and it keeps WASB decode and Gemini upload fast/cheap.
- **\*\*The 4K original was used only for the final stitch\*\*** ? that's why your reel came out true 3840x2160 while the analysis ran on 1080p.

## 2. Flowchart ? where WASB sits, how "rally end" is decided

The diagram above traces it, but the key idea is **\*\*rally boundaries are decided in two passes\*\*** (the two purple/pink-flagged nodes):

- **\*\*WASB (coarse, motion-based)\*\*** ? runs on the GPU over the 1080p frames and produces a per-frame shuttle trajectory ``(x, y, visible)``. ``trajectory_to_action_windows`` turns that into candidate rally windows: **\*\*shuttle moving = in-rally\*\***; short pauses are fused (``dead_time_merge_gap``), and a long stretch of stillness/invisibility ends the window. That's the **\*approximate\*** "where could a rally be" ? it found 18 windows.
- **\*\*Gemini (fine, semantic)\*\*** ? each candidate window is cut to a padded 1080p clip and sent to Gemini, which watches the actual play and returns the **\*\*exact\*\*** rally start/end (start = racket-to-shuttle contact, end = grounding/fault) plus the ``shot_count``. One WASB window can contain several real rallies ? that's how 18 windows became 52 confirmed rallies.

So: **\*\*WASB proposes, Gemini disposes.\*\*** The shot count that your filter uses is Gemini's ``shuttle_exchange_count``.

## 3. The ?5 reel is building now

``output\GX010125_min5_stitch.log`` is the live log. It's reusing the **\*\*24** cached rallies with `shot_count ? 5**` (vs 11 at >7) straight from the DB ? **\*\*no WASB or Gemini re-run\*\*** ? and cutting from the 4K original. Output will be ``output\GX010125_highlights_min5.mp4``. ETA ~8?12 min (24 clips re-encoded at 4K).

One note: this reel **\*\*will have the watermark\*\*** ("Generated by Khelsutra.guru"), because the bundled-font fix (#108) is now in place and the config default is on ? so it also doubles as live confirmation that fix works on real 4K. Say the word if you'd prefer it without and I'll regenerate watermark-free in a couple minutes. I'll confirm the count, duration, and 4K resolution when it lands.

### 555. user (2026-07-02T06:11:33.421Z)

<task-notification>

<task-id>bd1qgo1zh</task-id>

<summary>Monitor event: "?5 re-stitch milestones (filter, stitch, done, errors)"</summary>

<event>[REUSE] 52 cached rallies for video\_id=89605e80ed012ca259a640b7ec06cd80

[FILTER] shot\_count>5: kept 24, dropped 28

```
20:08:13 [backend.pipeline.stitcher.compiler] INFO: Trimming 24 segments (begin_padding=0.5s,
end_padding=0.5s)...</event>
If this event is something the user would act on now, send a PushNotification. Routine or benign
output doesn't need one.
</task-notification>
```

**556. assistant (2026-07-02T06:11:33.421Z)**

Cache reuse confirmed ? \*\*24 of 52 rallies have shot\_count ? 5\*\* (28 dropped), no re-inference.  
Now trimming 24 clips from the 4K original (~8?12 min). I'll confirm when it lands, and check  
whether the watermark rendered cleanly this time (validating #108 on real 4K).

**557. user (2026-07-02T06:11:33.421Z)**

where di this trajectory\_to\_action\_windows come from and can you explain more about this? How  
did it detect the "trajectory", code pointer on github will also help

**558. assistant (2026-07-02T06:11:33.421Z)**

Great question ? let me pull the actual implementation so I explain it precisely, and get the  
GitHub permalink info.

1 """TrackNet shuttle-trajectory runner (WSL2 subprocess adapter).
2
3 This bridges the Windows-side indexer to a TensorFlow TrackNetV4 install living
4 inside WSL2 (ADR-001 in docs/DECISIONS.md). The flow is:
5
6 1. Translate the Windows video path to its WSL-visible form (and optionally
7 stage it into the WSL filesystem to avoid slow /mnt/c per-frame reads).
8 2. Invoke ``src/predict.py`` inside the TrackNetV4 conda env via ``wsl``.
9 3. Read back the per-frame ``Frame,Visibility,X,Y`` CSV it writes.
10 4. Convert that trajectory into high-motion "action windows" ? the same
11 candidate-rally shape HybridYoloSegmenter produces ? so the rest of the
12 pipeline (AI handoff, DB population) is unchanged.
13
14 Nothing here imports TensorFlow; all model code stays in WSL.

Now I can give you the full picture with exact pointers. Pinning links to the current commit (`6de70aa`) so the line numbers stay stable.

### Where `trajectory\_to\_action\_windows` comes from

It's **the indexer's own code** ? not from WASB or TrackNet upstream. It was written as part of the **TrackNet WSL adapter** (ADR-001), and is deliberately **model-agnostic**: it lives as a `@staticmethod` on `TrackNetRunner`, and `WasbRunner` reuses it verbatim because both detectors emit the **same** `Frame, Visibility, X, Y` trajectory CSV:

```

- [tracknet_runner.py::trajectory_to_action_windows](backend/pipeline/detectors/tracknet_runner.py:233) ? the windowing logic ? [GitHub L233?L301](https://github.com/avidullu/badminton-highlight-indexer/blob/6de70aa5c840beb91aa50500e6e04b4d812f7429/backend/pipeline/detectors/tracknet_runner.py#L233-L301)
-
[tracknet_runner.py::parse_trajectory_csv](backend/pipeline/detectors/tracknet_runner.py:214) ? CSV ? points ? [GitHub L214?L231](https://github.com/avidullu/badminton-highlight-indexer/blob/6de70aa5c840beb91aa50500e6e04b4d812f7429/backend/pipeline/detectors/tracknet_runner.py#L214-L231)
- [wasb_runner.py](backend/pipeline/detectors/wasb_runner.py:154) ? WASB inheriting both, the "model-agnostic" seam ? [GitHub L154?L156](https://github.com/avidullu/badminton-highlight-indexer/blob/6de70aa5c840beb91aa50500e6e04b4d812f7429/backend/pipeline/detectors/wasb_runner.py#L154-L156)

```

### How the **\*trajectory\*** itself was detected (the `(x, y, visible)` per frame)

That's WASB, wrapped in `[wasb_infer.py::run](backend/pipeline/detectors/wasb_infer.py:207)` ([GitHub](https://github.com/avidullu/badminton-highlight-indexer/blob/6de70aa5c840beb91aa50500e6e04b4d812f7429/backend/pipeline/detectors/wasb\_infer.py#L207-L345)). Two upstream building blocks from **[nttcom/WASB-SBDT](https://github.com/nttcom/WASB-SBDT)** (MIT; "Widely Applicable Strong Baseline for Sports Ball Detection & Tracking", Tarashima et al., BMVC 2023):

```

1. *Detector* (build_detector ? detector.run_tensor,
[L297](https://github.com/avidullu/badminton-highlight-indexer/blob/6de70aa5c840beb91aa50500e6e04b4d812f7429/backend/pipeline/detectors/wasb_infer.py#L297)): a heatmap CNN (HRNet-style backbone). It takes a short stack of consecutive frames (frames_in, here 3 ? that's why

```

46,080 frames ? 46,078 windows) so it can use motion, and predicts a Gaussian **heatmap** per frame. The peak of the heatmap = the shuttle's pixel location; peak confidence below threshold ? "not visible" that frame.

2. **Online tracker** (`build\_tracker` ? `tracker.update`, [L338](https://github.com/avidullu/badminton-highlight-indexer/blob/6de70aa5c840beb91aa50500e6e04b4d812f7429/backend/pipeline/detectors/wasb\_infer.py#L338)): links the per-frame peaks into one coherent track (position/motion association), rejecting spurious blobs and filling `Visibility=0, X=Y=-1` where the shuttle is genuinely lost.

The result is one row per frame ? `Frame, Visibility(0/1), X, Y` ? which is exactly what `parse\_trajectory\_csv` reads. (Your run: 46,080 rows, 29,879 visible = 64.8%.)

## How `trajectory\_to\_action\_windows` turns that into candidate rallies

The core is a **velocity gate + temporal grouping**:

```
```python
```

per consecutive **VISIBLE** pair: speed as fraction-of-frame-width per second

```
dist      = ((p.x - prev.x)**2 + (p.y - prev.y)**2) ** 0.5
velocity = (dist / frame_width) * (fps / dframes)
if velocity > velocity_thresh:      # shuttle is "in flight"
    active.append((p.frame, velocity))
```

an **INVISIBLE** frame resets prev ? absent shuttle = not in flight (a natural break)

```
...
```

```
```python
```

### group active frames; a gap longer than merge\_gap closes the window

```
max_gap_frames = int(merge_gap * fps)
if af.frame - group[-1].frame <= max_gap_frames:
 group.append(af) # same rally ? short pause tolerated
else:
 windows.append(_finalize(group)); group = [af] # new rally
...
return [w for w in windows if (w.end - w.start) >= min_window_duration]
...`
```

Step by step:

1. **Velocity** is normalized by frame width (so it's resolution-independent ? works identically on 1080p) and converted to per-second. Above `velocity\_thresh` ? the frame is "active" (shuttle flying).
2. **An invisible shuttle breaks the trajectory** (`prev = None`) ? disappearance is itself a boundary signal.
3. **Grouping** merges active frames within `merge\_gap` seconds into one window ? so the brief pauses *between shots within a rally* don't split it, but a long stillness (shuttle down, players resetting) **ends** the window. ? this is the "coarse rally boundary" from the flowchart.
4. Windows shorter than `min\_window\_duration` are dropped (kills jitter/false blips). Each window carries `start/end`, `peak\_velocity`, `mean\_velocity`, `active\_frame\_count`.

These three knobs come from `config.json` ? indexing.wasb`:

- `velocity\_threshold` (0.02) ? `velocity\_thresh`
- `dead\_time\_merge\_gap` (2.0s) ? `merge\_gap`
- `min\_action\_window\_duration` (2.0s) ? `min\_window\_duration`

So WASB gives you **motion-derived** candidate windows (18 of them on your video); Gemini then refines each into precise rallies with shot counts. The windowing is intentionally the same shape `HybridYoloSegmenter` produces, which is why the AI-handoff + DB stages are detector-agnostic.

```

```

Meanwhile the **25 reel** is still stitching\*\* (24 clips from 4K, last I saw "Trimming 24 segments") ? I'll confirm it with resolution + duration when it finishes.

#### 587. assistant (2026-07-02T06:11:33.424Z)

### Your GPU right now: idle of pipeline work

`32% util, 2.2 GB, 21 W` ? that's just **desktop apps** holding the GPU for compositing/decode (Edge WebView, explorer, WhatsApp, the Claude app, VS Code, and **VLC** ? possibly you previewing the reel). **No compute job is running** ? no `python` or `ffmpeg` process, and no ML/encode load (the 2070 Super pulls ~80 W under real load; 21 W is idle). The ?5 stitch already finished.

### Does stitching use the GPU? **No ? it's CPU.**

The compiler encodes with the **software x264 encoder**, not NVENC:

```
- Per-clip re-encode: [`c:v libx264 -preset
superfast`](backend/pipeline/stitcher/compiler.py:248) (CPU)
- Final join: [`c copy`](backend/pipeline/stitcher/compiler.py:332) (stream-copy, no encoding
at all)
```

So the ~11-minute ?5 stitch was **CPU-bound** (24 clips of 4K x264 + a watermark drawtext filter, which is also a CPU filter). That's why GPU stayed low while it ran.

**For contrast, what did run on the GPU earlier:**

```
- The 4K?1080p proxy transcode ? `h264_nvenc` (GPU encoder).
- WASB shuttle inference ? the detector CNN on CUDA.
```

So in this whole job, the GPU did the **analysis** (WASB) and the **proxy**, while the **final stitch** is CPU.

### ?5 reel is done and verified: `output\GX010125\_highlights\_min5.mp4`

```
- 24 rallies (shot_count ? 5), true 4K 3840x2160, 59.94 fps, 4:08, 1987 MB, cut from
the original.
- 0 watermark failures this time (vs 12/12 on the >7 reel) ? so the watermark is now
correctly burned in. That's a clean end-to-end confirmation that the #108 fix works on real 4K
footage.
```

You now have both: `GX010125\_highlights.mp4` (11 rallies, >7 shots, no watermark) and  
`GX010125\_highlights\_min5.mp4` (24 rallies, ?5 shots, watermarked).

---

If the 11-minute CPU stitch felt slow: I can make the stitcher **\*\*GPU-encode with NVENC\*\*** (decode ``-hwaccel cuda` + `-c:v h264_nvenc``), which would cut 4K stitching from ~minutes to ~tens of seconds. It's a legit improvement, but it needs a **\*\*software fallback\*\*** (NVENC isn't present on the Linux CI or non-NVIDIA machines) and a CRF?CQ quality mapping, so I'd do it as a proper PR with the fallback rather than hard-switching. Want me to take that on?

**588. user (2026-07-02T06:11:33.424Z)**

can you do a cleanup of all cached video in the WSL? show me all the files which you will delete

**589. assistant (2026-07-02T06:11:33.424Z)**

Good ? destructive cleanup, so I'll **\*\*inventory first and show you the full list before deleting anything.\*\*** Let me take a complete picture of the WSL staging area:

## 592. assistant (2026-07-02T06:11:33.424Z)

Here's the complete inventory of `~/clips` (163 GB total). I've categorized it ? **\*\*nothing is deleted yet.\*\***

## ?? Proposed for deletion ? "cached video" (~163 GB)

**\*\*Decoded frame caches (`\*\_frames/` ? the space hogs, all regenerable from the videos):\*\***

```

| Dir | Size |
|---|---|
| `GX010125_1080p__89605e80ed01_frames` | **93 G** |
| `adarsh_avi_full_frames` | 17 G |
| `gbaaddy_frames` | 16 G |
| `kushagra_frames` | 11 G |
| `mahadevpura_smoke_180s__05e0e577029d_frames` | 9.5 G |
| `adarsh_avi_frames` | 7.0 G |
| `largetestvideo_frames` | 4.5 G |
| `mahadevpura_frames` | 2.4 G |
| `pickleball_frames` | 1.5 G |
| `tabletennis_frames` | 659 M |

```

**\*\*Staged video copies (\*.mp4` ? originals exist elsewhere):\*\***

```

| File | Size | Original lives at |
|---|---|---|
| `GX010125_1080p__89605e80ed01.mp4` | 2.2 G | Windows `output\GX010125_1080p.mp4` |
| `mahadevpura_smoke_180s__05e0e577029d.mp4` | 87 M | golden-set source |

```

## ? Will be KEPT (not video ? ~50 MB total)

- **\*\*Trajectory results\*\*** (`\*\_traj.csv`, etc. ? adarsh, kushagra, gbaaddy, mahadevpura, pickleball, tabletennis?) ? these are your **\*\*WASB analysis outputs / golden-set corpus trajectories\*\***, GPU-generated and tied to eval work. Tiny, valuable, not video.

- **\*\*Detector resume caches\*\*** (`\*\_wasbcache/`, ~45 MB) ? not video; deleting would force re-inference.
- Run scripts (`\*.sh`) and logs (`\*.log`).

## Two things to note

- **\*\*GX010125's detector cache + trajectory CSV are NOT in WSL\*\*** ? they're on the Windows side (`output\wasb\?`), so this WSL cleanup won't touch them. The 52 confirmed rallies are in the SQLite DB, so **\*\*re-stitching either reel will still work\*\*** after this cleanup (stitch reads the DB + the 4K original, not these frames).
- Everything here is regenerable (frames re-extract from the videos; staged copies re-copy from originals), so this is reclaimable space, not lost work.

How much do you want me to remove?

### 593. assistant (2026-07-02T06:11:33.424Z)

```
[external_agent_tool_call: AskUserQuestion]
input: {"questions":[{"question":"Confirm WSL ~/clips cleanup scope (frame caches + staged videos):","header":"Cleanup scope","multiSelect":false,"options":[{"label":"Delete all (~163 GB)","description":"Remove all 10 *_frames dirs + both staged .mp4 copies. Keeps trajectory CSVs, wasbcache, scripts, logs. Full reclaim. Re-running any video would re-extract frames."},{label":"Keep GX010125, delete rest","description":"Delete the 9 older golden-set frame dirs + the mahadevpura smoke .mp4 (~70 GB), but keep GX010125's 93 GB frames + 2.2 GB proxy copy so re-running WASB on it stays instant."},{label":"Frames only, keep staged .mp4s","description":"Delete all 10 *_frames dirs (~162 GB) but keep the 2 staged video copies. Marginal ? the .mp4s are only 2.3 GB."}]]}
[/external_agent_tool_call]
```

### 594. assistant (2026-07-02T06:11:33.424Z)

```
[external_agent_tool_result]
Your questions have been answered: "Confirm WSL ~/clips cleanup scope (frame caches + staged videos):"="Keep GX010125, delete rest". You can now continue with these answers in mind.
[/external_agent_tool_result]
```

### 595. assistant (2026-07-02T06:11:33.424Z)

Confirmed ? keeping GX010125's cache, deleting the 9 older golden-set frame dirs + the mahadevpura smoke clip (~70 GB). Running it now with before/after verification:

### 596. assistant (2026-07-02T06:11:33.424Z)

```
[external_agent_tool_call: PowerShell]
description: Delete older frame caches + smoke video, keep GX010125, verify
command: wsl -d Ubuntu -- bash -lc 'cd ~/clips && echo "BEFORE:" && df -h ~ | tail -1 && rm -rf
adarsh_avi_full_frames gbaaddy_frames kushagra_frames
mahadevpura_smoke_180s__05e0e577029d_frames adarsh_avi_frames largetestvideo_frames
mahadevpura_frames pickleball_frames tabletennis_frames mahadevpura_smoke_180s__05e0e577029d.mp4
&& echo "AFTER:" && df -h ~ | tail -1 && echo "=== remaining *_frames (expect only GX010125)
===&& du -sh *_frames 2>/dev/null && echo "=== remaining videos (expect only GX010125 proxy)
===&& ls -lah *.mp4 *.MP4 2>/dev/null && echo "=== ~/clips total now ===&& du -sh .
2>/dev/null'
[/external_agent_tool_call]
```

### 597. assistant (2026-07-02T06:11:33.424Z)

[/external_agent_tool_result]
```

#### 601. assistant (2026-07-02T06:11:33.425Z)

Cleanup complete and verified. ?

### Result

	Before	After
~/clips` total	163 GB	<b>95 GB</b>
WSL disk free	736 GB	<b>804 GB</b> (+68 GB)

**Deleted** (10 items, ~68 GB): the 9 older golden-set frame caches ? `adarsh\_avi\_full\_frames`, `gbaaddy\_frames`, `kushagra\_frames`, `mahadevpura\_smoke?\_frames`, `adarsh\_avi\_frames`, `largetestvideo\_frames`, `mahadevpura\_frames`, `pickleball\_frames`, `tabletennis\_frames` ? plus the `mahadevpura\_smoke?mp4` staged clip.

**Kept**, as you chose:

- `GX010125\_1080p\_\_89605e80ed01\_frames` (93 G) + the proxy `?01.mp4` (2.2 G) ? so re-running WASB on this video stays instant.
- **11 trajectory CSVs** (your golden-set WASB outputs) and **10 `\*\_wasbcache` dirs** ? all survived.
- Run scripts + logs.

Nothing else was touched ? the Windows-side artifacts (the `output\` proxy, the GX010125 detector cache/CSV in `output\wasb\`, and the SQLite DB with the 52 cached rallies) are all intact, so re-stitching either reel still works without re-running anything.

If you later want to reclaim that last 95 GB too (once you're done with this video), just say so

and I'll drop the GX010125 frames + proxy as well.

## 602. user (2026-07-02T06:11:33.425Z)

can you make a plan on how to ensure we keep doing cleanups in a healthy way?

## 603. assistant (2026-07-02T06:11:33.425Z)

Here's a plan for keeping cache hygiene healthy without it becoming a chore ? built around what we actually saw accumulate.

### The core problem

The bloat is **regenerable intermediates**, dominated by one thing: PNG frame extraction materializes every frame to disk ? **93 GB** for a single 12.8-min 4K video. Across many videos that's unbounded. Staged video copies (2 GB+ each) pile on. Meanwhile the **valuable** outputs are tiny or already archived. So the principle is simple:

> **Separate regenerable intermediates (purge aggressively, automatically) from durable outputs (keep/archive). Make purging default-safe ? dry-run first, the "show me before you delete" pattern.**

### Retention policy ? what lives where, and its lifespan

Artifact	Location	Regenerable?	Policy
`*_frames/` (PNG decode)	WSL `~/clips`	? from video	<b>Delete on success</b> (only needed during the detector pass)
Staged `*.mp4` copies	WSL `~/clips`	? from original	<b>Delete on success</b>
`*_wasbcache/` (resume cache)	WSL + `output/wasb`	?	Keep only while a run is in-flight/iterating; drop once CSV exists
`chunks_*_handoff/`, `tmp*/`	Windows `output/`	?	Auto-clean per run; sweep stragglers on crash
1080p proxy `*_1080p.mp4`	Windows `output/`	? from 4K	Keep while iterating on that video; purge when done
<b>Trajectory CSVs</b>	`~/clips`, `output/wasb`	?? GPU-only	<b>Keep</b> ; archive to `Annotation Setup\Collect\Trajectories`
<b>SQLite DB (rallies)</b>	`output/`	?? Gemini cost	<b>Keep</b> ? this is what makes re-stitch free
<b>Final reels</b>	`output/`	?? expensive	Keep until copied out, then purge

### Tier 1 ? Make the pipeline self-clean (the real fix)

The highest-leverage change: **delete the `\*\_frames/` dir and staged video automatically once the trajectory CSV is written successfully.** Frames are purely intermediate ? after the CSV exists they're dead weight. Done right this caps per-video frame bloat to "during the run only," so it never accumulates again.

- Add `indexing.keep\_frames: false` (default) to config; gate deletion on it so debugging can opt to retain.
- **Only delete on success** (CSV present) ? on failure, keep frames + `wasbcache` so the resume-across-reboots design still works.
- Wire it in `wasb\_runner.run\_predict` / `tracknet\_runner` (they already know the frames path). This is a clean, testable PR.

### Tier 2 ? A dry-run-first cleanup tool

Replace ad-hoc `rm` with `tools/cleanup\_caches.py` (or scratch first):

- Scans **both** WSL `~/clips` and Windows `output/{wasb,chunks\_\*\_handoff,tmp\*}`.
- Classifies each entry (regenerable vs durable) and prints a **sized report** ? dry-run by default (exactly the review-first flow you just used).
- `--apply` to delete; `--keep-video <id>` to protect current work; `--older-than 7d` / `--min-size` filters.

- One command, repeatable, no per-session re-discovery of paths.

### Tier 3 ? Cadence + guardrails (so it actually happens)

- **\*\*Disk preflight in the runner\*\***: check `df` before extraction; warn (or refuse) if free space < threshold (e.g. 100 GB), optionally offering to GC the oldest frame caches.
- **\*\*Cadence tied to the existing checkpoint convention\*\***: run the cleanup tool's dry-run at session wrap and after each completed video; that's when frames are safe to drop (CSV + DB rallies exist).
- **\*\*Optional passive hook\*\***: a `Stop`/`SessionEnd` hook in `settings.json` that runs the dry-run *\*report only\** (never auto-deletes) so you always see accumulation before it's a problem.

### Tier 4 ? Guarantee outputs are durable first

Cleanup is only safe because outputs survive: ensure trajectory CSVs land in `Annotation Setup\Collect\Trajectories` and reels get copied out, *\*then\** intermediates are always disposable. This is already the convention ? Tier 1/2 just lean on it.

---

**\*\*My recommendation\*\*** Tier 1 is the one that actually ends the problem (the pipeline stops hoarding 93 GB/video); Tier 2 makes the occasional manual sweep safe and fast. Tiers 3?4 are policy/cadence, mostly already in your conventions.

Want me to:

#### 604. assistant (2026-07-02T06:11:33.425Z)

```
[external_agent_tool_call: AskUserQuestion]
input: {"questions":[{"question":"Which parts of the cleanup plan should I build now?","header":"Build scope","multiSelect":true,"options":[{"label":"Tier 1: self-cleaning pipeline","description":"PR: auto-delete *_frames/ + staged video after the trajectory CSV is written (config keep_frames: false default, only on success). Ends the per-video bloat at the source. Tests + merge on green."},{label":"Tier 2: cleanup tool","description":"Build tools/cleanup_caches.py (dry-run by default, --apply, --keep-video, age/size filters) covering WSL ~/clips + Windows output/. Reusable, review-first."},{label":"Tier 3: disk-guard + hook","description":"Add a free-space preflight warning to the runner, and an optional report-only SessionEnd hook so accumulation always surfaces."},{label":"Save policy to memory","description":"Record the retention table + cadence as a project memory so future sessions follow it without re-deriving."}]}]}
[/external_agent_tool_call]
```

#### 605. assistant (2026-07-02T06:11:33.425Z)

```
[external_agent_tool_result]
Your questions have been answered: "Which parts of the cleanup plan should I build now?"="Tier 1: self-cleaning pipeline,Tier 2: cleanup tool,Tier 3: disk-guard + hook,Save policy to memory". You can now continue with these answers in mind.
[/external_agent_tool_result]
```

#### 606. assistant (2026-07-02T06:11:33.425Z)

All four ? let me build them. I'll start a new phase, save the policy to memory, and read the exact code I need to modify.

#### 607. assistant (2026-07-02T06:11:33.425Z)

[external_agent_tool_result]
1 """Abstract base for detector runners (TrackNet, WASB, future native, etc.).
2
3 This completes the Detector Runner Abstraction (low-regret item 6 continuation / item 1
4 of the post-observability re-prioritization) to de-risk the WSL/conda dependency for
5 the high-accuracy shuttle trajectory substrate used by tracknet_hybrid / wasb_hybrid.
6
7 The ABC lets us:
8 - Keep the current WSL adapters working unchanged for Windows users.
9 - Swap in (or A/B test) a Linux-native implementation later with zero changes to
10 the hybrid segmenters or the model-agnostic windowing brain.
11 - Provide a single place to evolve the healthcheck / error contract and thread
12 detector readiness into per-video reports.
13
14 Contract (deliberately matches what the concrete runners + hybrids + tests already did):
15 - run_predict(video_win_path: str, output_win_dir: str) -> Optional[str]
16 Run detector, return the Windows-side path to the produced trajectory CSV
17 (e.g. ".../clip_predict.csv" or ".../clip_wasb.csv"), or None on any failure.
18 The caller (hybrid) is responsible for output dir; impls may stage the video
19 into WSL fs for perf.
20
21 - healthcheck() -> tuple[bool, str]
22 Return (ok, message). Never raises. "ok" decides whether to proceed to run_predict.
23 Message is logged (and can be surfaced to reports or UX in future).
24 Intended to be cheap (env existence, import, GPU visibility, weights present).
25
26 Existing behavior is 100% preserved. The only additions are the inheritance and
27 the explicit common type for future implementers.
28
29 How to add a new runner (for docs / future contributors):
30 1. Subclass DetectorRunner in a new or existing module under pipeline/detectors/.
31 2. Implement run_predict and healthcheck (return (bool, str) tuple).
32 3. If it produces the same CSV schema (Frame,Visibility,X,Y), reuse or re-export
33 TrackNetRunner.parse_trajectory_csv and .trajectory_to_action_windows (they are
34 deliberately static and model-agnostic). If the new detector needs different
35 windowing, it can implement its own or we generalize later.
36 4. Lazy-import heavy native deps inside the methods (so importing the segmenter
37 registry never pulls torch/tf on a machine that doesn't have them).
38 5. Update the two hybrid segmenters (or introduce a detector= choice) to accept
```

```

39 DetectorRunner instances (they already do the right thing via duck-typing + the
40 type hints we add here).
41 6. Add unit tests that exercise the contract (isinstance, healthcheck shape, run
42 returns str|None) using mocks for the external bits ? see test_tracknet_runner.py.
43 7. No change to eval/calibration code paths (they consume the CSV + the static
44 windowing helpers directly).
45
46 Optional Linux-native path (the main de-risk goal):
47 A LinuxNativeRunner (or ONNXRunner) would:
48 - Skip all wsl / _stage / conda activate.
49 - Load weights locally (torch or onnx) or call a native binary.
50 - Write the exact same CSV format so trajectory_to_action_windows works verbatim.
51 - healthcheck can just check "weights file exists and torch importable + CUDA?".
52 This removes the WSL requirement for Linux users / future SaaS workers while
53 keeping the exact same candidate quality characteristics (or better, once native
54 weights are available).
55
56 Error surfacing into reports:
57 The healthcheck message is already logged by the hybrids on failure. The reporting
58 harvest sees the outcome as "0 candidates" + detector name. When we wire richer
59 segmenter Results (or pass detector_health into emit_indexer_report context), the
60 (ok, msg) can be recorded explicitly under segmentation.details or a new detector
61 stage. The ABC makes that future change local to one place.
62
63 See also:
64 - backend/pipeline/segmenters/{tracknet_hybrid,wasb_hybrid}.py (the two callers)
65 - tests/test_tracknet_runner.py (contract + pure logic tests; hybrids mock the runner)
66 - docs/T...

input: {"pattern":"backend/tools/*.py"}
[/external_agent_tool_call]
```

**648. assistant (2026-07-02T06:11:33.428Z)**

```
[external_agent_tool_result]
backend\tools\rally_slicer.py
backend\tools__init__.py
backend\tools\export.py
[/external_agent_tool_result]
```

**649. assistant (2026-07-02T06:11:33.428Z)**

I'll create a top-level `tools/` package for ops tooling. Writing the cleanup tool with pure, testable classification logic:

**650. assistant (2026-07-02T06:11:33.428Z)**

```
[external_agent_tool_call: Write]
file: C:\Users\avidu\Projects\badminton-highlight-indexer\tools__init__.py
[/external_agent_tool_call]
```

**651. assistant (2026-07-02T06:11:33.428Z)**

```
[external_agent_tool_result]
File created successfully at: C:\Users\avidu\Projects\badminton-highlight-indexer\tools__init__.py (file state is current in your context ? no need to Read it back)
[/external_agent_tool_result]
```

**652. assistant (2026-07-02T06:11:33.428Z)**

```
[external_agent_tool_call: Write]
file: C:\Users\avidu\Projects\badminton-highlight-indexer\tools\cleanup_caches.py
[/external_agent_tool_call]
```

**653. assistant (2026-07-02T06:11:33.428Z)**

```
[external_agent_tool_result]
File created successfully at: C:\Users\avidu\Projects\badminton-highlight-indexer\tools\cleanup_caches.py (file state is current in your context ? no need to Read it back)
[/external_agent_tool_result]
```

**654. assistant (2026-07-02T06:11:33.428Z)**

Let me test the cleanup tool live (dry-run ? safe) to confirm it scans and classifies correctly on the real machine:

**655. assistant (2026-07-02T06:11:33.428Z)**

```
[external_agent_tool_call: PowerShell]
description: Dry-run cleanup tool, protecting current video
command: cd C:\Users\avidu\Projects\badminton-highlight-indexer && python -m
tools.cleanup_caches --keep-video 89605e80ed01
[/external_agent_tool_call]
```

**656. assistant (2026-07-02T06:11:33.428Z)**

```
[external_agent_tool_result]

DRY RUN ? nothing deleted. Re-run with --apply to delete the PURGE list.  
[/external\_agent\_tool\_result]

657. assistant (2026-07-02T06:11:33.428Z)

The Windows scan works, but the \*\*WSL scan returned nothing\*\* ? `~/clips` (with the 93 GB frames, proxy copy, CSVs) didn't show. Let me debug why:

#### 658. assistant (2026-07-02T06:11:33.428Z)

```
[external_agent_tool_call: PowerShell]
description: Debug scan_wsl: check wsl on PATH and entry count
command: cd C:\Users\avidu\Projects\badminton-highlight-indexer && python -c "import shutil;
print('wsl on PATH:', shutil.which('wsl')); from tools.cleanup_caches import scan_wsl;
e=scan_wsl('Ubuntu','~/clips'); print('entries:', len(e)); [print(x.is_dir, x.size, x.name) for
x in e[:5]]"
[/external_agent_tool_call]
```

#### 659. assistant (2026-07-02T06:11:33.428Z)

```
[external_agent_tool_result]
wsl on PATH: C:\Windows\system32\wsl.EXE
entries: 0
[/external_agent_tool_result]
```

#### 660. assistant (2026-07-02T06:11:33.428Z)

`wsl` resolves but yields 0 entries. Let me capture the raw output to see if it's the known  
`wsl.exe` UTF-16 piping quirk:

#### 661. assistant (2026-07-02T06:11:33.428Z)

```
[external_agent_tool_call: PowerShell]
description: Diagnose wsl output encoding for scan_wsl
command: cd C:\Users\avidu\Projects\badminton-highlight-indexer && python -c "
import subprocess, os
script = 'cd ~/clips 2>/dev/null || exit 0; for e in *; do [-e \"$e\"] || continue; d=0; [-d
\"$e\"] && d=1; sz=$(du -sb \"$e\" 2>/dev/null | cut -f1); printf \"%s\t%s\t%s\n\" \"$d\"
\"$sz\" \"$e\"; done'
print('--- text=True (default env) ---')
r = subprocess.run(['wsl','-d','Ubuntu','bash','-lc',script], capture_output=True, text=True,
timeout=120)
print('rc', r.returncode, 'stdout len', len(r.stdout), 'repr head', repr(r.stdout[:120]))
print('--- bytes ---')
r2 = subprocess.run(['wsl','-d','Ubuntu','bash','-lc',script], capture_output=True, timeout=120)
print('raw head', repr(r2.stdout[:60]))
print('--- WSL_UTF8=1 ---')
r3 = subprocess.run(['wsl','-d','Ubuntu','bash','-lc',script], capture_output=True, text=True,
timeout=120, env={**os.environ,'WSL_UTF8':'1'})
print('rc', r3.returncode, 'lines', len(r3.stdout.splitlines()), 'head', repr(r3.stdout[:120]))
"
[/external_agent_tool_call]
```

#### 662. assistant (2026-07-02T06:11:33.428Z)

```

[/external\_agent\_tool\_result]

**663. assistant (2026-07-02T06:11:33.429Z)**

PowerShell mangled the inline script. Let me use a debug file instead:

**664. assistant (2026-07-02T06:11:33.429Z)**

[external\_agent\_tool\_call: Write]  
file: C:\Users\avidu\Projects\badminton-highlight-indexer\scratch\debug\_wsl.py  
[/external\_agent\_tool\_call]

**665. assistant (2026-07-02T06:11:33.429Z)**

[external\_agent\_tool\_result]  
File created successfully at: C:\Users\avidu\Projects\badminton-highlight-indexer\scratch\debug\_wsl.py (file state is current in your context ? no need to Read it back)  
[/external\_agent\_tool\_result]

**666. assistant (2026-07-02T06:11:33.429Z)**

[external\_agent\_tool\_call: PowerShell]  
description: Run WSL scan encoding diagnostic  
command: cd C:\Users\avidu\Projects\badminton-highlight-indexer && python scratch\debug\_wsl.py  
[/external\_agent\_tool\_call]

**667. assistant (2026-07-02T06:11:33.429Z)**

[external\_agent\_tool\_result]  
--- text=True, default env ---  
rc 0 stdout chars 0 stderr ''  
stdout repr head: ''  
--- raw bytes head ---  
b''  
--- WSL\_UTF8=1 ---  
rc 0 lines 0  
head: ''  
[/external\_agent\_tool\_result]

**668. assistant (2026-07-02T06:11:33.429Z)**

All three return empty with rc=0 ? so it's not encoding; the `cd ~/clips || exit 0` is silently bailing. Let me probe `whoami`/`\$HOME`/`pwd` under `bash -c` vs `bash -lc`:

**669. assistant (2026-07-02T06:11:33.429Z)**

[external\_agent\_tool\_call: Write]  
file: C:\Users\avidu\Projects\badminton-highlight-indexer\scratch\debug\_wsl.py  
[/external\_agent\_tool\_call]

**670. assistant (2026-07-02T06:11:33.429Z)**

[external\_agent\_tool\_result]  
The file C:\Users\avidu\Projects\badminton-highlight-indexer\scratch\debug\_wsl.py has been updated successfully. (file state is current in your context ? no need to Read it back)  
[/external\_agent\_tool\_result]

**671. assistant (2026-07-02T06:11:33.429Z)**

[external\_agent\_tool\_call: PowerShell]  
description: Probe WSL user/home/pwd under bash -c vs -lc

```
command: cd C:\Users\avidu\Projects\badminton-highlight-indexer && python scratch\debug_wsl.py
[/external_agent_tool_call]
```

#### 672. assistant (2026-07-02T06:11:33.429Z)

```
[external_agent_tool_result]
=== bash -c (no --) === rc=0
STDOUT: 'user=avidullu home=/home/avidullu pwd=/mnt/c/Users/avidu/Projects/badminton-highlight-indexer\nclips_count=39\nndirect=39\n'
STDERR: ''

=== bash -lc (no --) === rc=0

STDERR: ''
[/external_agent_tool_result]
```

#### 673. assistant (2026-07-02T06:11:33.429Z)

The path resolves fine (39 entries, `home=/home/avidullu`) ? so it's something in my scan \*script\* specifically. Let me isolate the `cd` + loop:

#### 674. assistant (2026-07-02T06:11:33.429Z)

```
[external_agent_tool_call: Write]
file: C:\Users\avidu\Projects\badminton-highlight-indexer\scratch\debug_wsl.py
[/external_agent_tool_call]
```

#### 675. assistant (2026-07-02T06:11:33.429Z)

```
[external_agent_tool_result]
The file C:\Users\avidu\Projects\badminton-highlight-indexer\scratch\debug_wsl.py has been
updated successfully. (file state is current in your context ? no need to Read it back)
[/external_agent_tool_result]
```

#### 676. assistant (2026-07-02T06:11:33.429Z)

```
[external_agent_tool_call: PowerShell]
description: Isolate cd vs loop in WSL scan
command: cd C:\Users\avidu\Projects\badminton-highlight-indexer && python scratch\debug_wsl.py
[/external_agent_tool_call]
```

#### 677. assistant (2026-07-02T06:11:33.429Z)

```
[external_agent_tool_result]
=== A: cd + pwd + count === rc=0
STDOUT: '/home/avidullu/clips\n39\n'
STDERR: ''

=== B: cd guarded + loop echo === rc=0
STDOUT: 'X\nX\nX\n'
STDERR: ''

=== C: full scan loop === rc=0
STDOUT: ''
STDERR: ''
[/external_agent_tool_result]
```

#### 678. assistant (2026-07-02T06:11:33.430Z)

The loop variable `\$e` is coming back **empty** ? `[ -e "\$e" ]` then fails and `continue` skips everything (that's why C is silent). The glob/loop is misbehaving through the Python?wsl.exe layer. Let me check whether it's Python-subprocess-specific by running the same loop via PowerShell, and test the cleaner `\\wsl.localhost` UNC approach:

**679. assistant (2026-07-02T06:11:33.430Z)**

```
[external_agent_tool_call: PowerShell]
description: Test loop via PowerShell wsl and UNC path access to WSL clips
command: Write-Output "=== via PowerShell wsl (loop) ==="; wsl -d Ubuntu -- bash -lc 'cd
~/clips; for e in *; do echo "X$e"; done | head -3'; Write-Output "=== UNC path access ===";
$u="\\wsl.localhost\Ubuntu\home\avidullu\clips"; if (Test-Path $u) { Write-Output "UNC OK";
(Get-ChildItem $u | Measure-Object).Count } else { $u2="\\wsl$Ubuntu\home\avidullu\clips";
Write-Output "trying wsl$: $(Test-Path $u2)" }
[/external_agent_tool_call]
```

**680. assistant (2026-07-02T06:11:33.430Z)**

```
[external_agent_tool_result: error]
Exit code 1
ParserError:
Line |
 1 | ? \wsl$Ubuntu\home\avidullu\clips"; Write-Output "trying
wsl$: $(Test- ?
 |
~~
 | Variable reference
is not valid. '$' was not followed by a valid variable name character. Consider using ${} to
 |
delimit the name.
[/external_agent_tool_result]
```

**681. assistant (2026-07-02T06:11:33.430Z)**

PowerShell choked on the literal `wsl\$`. Let me run those checks cleanly:

**682. assistant (2026-07-02T06:11:33.430Z)**

```
[external_agent_tool_call: PowerShell]
description: Loop test via PowerShell wsl
command: wsl -d Ubuntu -- bash -lc 'cd ~/clips; for e in *; do echo "X$e"; done | head -3'
[/external_agent_tool_call]
```

**683. assistant (2026-07-02T06:11:33.430Z)**

```
[external_agent_tool_result]
X
X
X
[/external_agent_tool_result]
```

**684. assistant (2026-07-02T06:11:33.430Z)**

```
[external_agent_tool_call: PowerShell]
description: Test UNC access to WSL clips dir
command: $u = "\\wsl.localhost\Ubuntu\home\avidullu\clips"; "UNC exists: $(Test-Path $u)"; if
(Test-Path $u) { "entries: $((Get-ChildItem -Force $u | Measure-Object).Count)" }
[/external_agent_tool_call]
```

**685. assistant (2026-07-02T06:11:33.430Z)**

```
[external_agent_tool_result]
UNC exists: True
entries: 39
```

```
[/external_agent_tool_result]
```

**686. assistant (2026-07-02T06:11:33.430Z)**

Found it ? the `for e in \*` loop returns empty `\$e` \*\*even via PowerShell\*\*, so it's the user's login-shell environment interfering with the loop (not Python). But two patterns are proven reliable: `du -sb` (I used `du -sh ./` successfully earlier) and the `\\wsl.localhost` UNC path. Let me rebuild `scan\_wsl` on `du` + `find` (native-fast, no fragile loop) ? testing the commands first:

**687. assistant (2026-07-02T06:11:33.430Z)**

```
[external_agent_tool_call: PowerShell]
description: Test du + find scan commands for WSL
command: Write-Output "=== du -sb (size+path) ==="; wsl -d Ubuntu -- bash -lc 'du -sb ~/clips/*
2>/dev/null | head -4'; Write-Output "=== find (type+mtime+name) ==="; wsl -d Ubuntu -- bash -lc
"find ~/clips/ -maxdepth 1 -mindepth 1 -printf '%y\t%T@\t%f\n' 2>/dev/null | head -4"
[/external_agent_tool_call]
```

**688. assistant (2026-07-02T06:11:33.430Z)**

```
[external_agent_tool_result]
=== du -sb (size+path) ===
2352117156 /home/avidullu/clips/GX010125_1080p__89605e80ed01.mp4
98860500712 /home/avidullu/clips/GX010125_1080p__89605e80ed01_frames
404 /home/avidullu/clips/adarsh_avi_full_run.log
2476375 /home/avidullu/clips/adarsh_avi_full_traj.csv
=== find (type+mtime+name) ===
f 1780923256.8006703080 adarsh_avi_full_run.log
f 1780981801.0278589990 mahadevpura_run.log
f 1780907422.4687402170 run_wasb_avi.sh
f 1780743130.8096656640 wasb_traj_test.csv
[/external_agent_tool_result]
```

**689. assistant (2026-07-02T06:11:33.430Z)**

Both work perfectly. Let me rebuild `scan\_wsl` on `du` + `find` (no fragile loop):

**690. assistant (2026-07-02T06:11:33.430Z)**

```
[external_agent_tool_call: Edit]
file: C:\Users\avidu\Projects\badminton-highlight-indexer\tools\cleanup_caches.py
[/external_agent_tool_call]
```

**691. assistant (2026-07-02T06:11:33.430Z)**

```
[external_agent_tool_result]
The file C:\Users\avidu\Projects\badminton-highlight-indexer\tools\cleanup_caches.py has been
updated successfully. (file state is current in your context ? no need to Read it back)
[/external_agent_tool_result]
```

**692. assistant (2026-07-02T06:11:33.430Z)**

Now let me re-test the tool live (dry-run, protecting GX010125):

**693. assistant (2026-07-02T06:11:33.430Z)**

```
[external_agent_tool_call: PowerShell]
description: Dry-run cleanup tool again, now with fixed WSL scan
command: cd C:\Users\avidu\Projects\badminton-highlight-indexer && python -m
tools.cleanup_caches --keep-video 89605e80ed01 2>&1 | Select-Object -First 40
[/external_agent_tool_call]
```

#### 694. assistant (2026-07-02T06:11:33.430Z)

```

```

#### 695. assistant (2026-07-02T06:11:33.431Z)

The WSL scan works now ? with `--keep-video 89605e80ed01`, GX010125's 92 G frames + staged copy are correctly protected. One cosmetic fix: `output\wasb` is listed both as a dir and via its contents (double-count). Let me skip that redundancy, then write tests:

#### 696. assistant (2026-07-02T06:11:33.431Z)

```
[external_agent_tool_call: Edit]
file: C:\Users\avidu\Projects\badminton-highlight-indexer\tools\cleanup_caches.py

Exactly the 8 intended files staged (config.json stays local). Committing, pushing, opening PR:

### 732. assistant (2026-07-02T06:11:33.433Z)

```

[external_agent_tool_call: PowerShell]
description: Commit and push cache-hygiene branch
command: cd C:\Users\avidu\Projects\badminton-highlight-indexer && git commit -m '@'
feat: cache hygiene ? self-cleaning pipeline + cleanup tool + disk guard

```

The GPU pipeline left ~GBs of regenerable intermediates per video in the WSL stage dir ? dominated by PNG frame extraction (~93 GB for one 12.8-min 4K clip). Across videos this grew unbounded (observed live: ~163 GB in ~/clips). The valuable outputs (trajectory CSVs, the rally DB, final reels) are tiny or already archived, so the fix is to treat frames/staged copies as disposable and purge them automatically + safely.

Tier 1 ? self-cleaning runners (the root fix):

- After a SUCCESSFUL run (trajectory CSV written) the WASB runner deletes the decoded frame cache + staged video; TrackNet deletes its staged video. Gated by indexing.{wasb,tracknet}.keep\_frames (default false). On FAILURE nothing is deleted, so the frame + detector caches remain for a resumable re-run.

Tier 3a ? disk guard:

- indexing.{wasb,tracknet}.min\_free\_gb (default 0 = off): warn before a run if WSL free space is below the threshold, so a long extraction can't quietly fill the disk.
- Shared WslCommandMixin.\_wsl\_free\_gb / \_wsl\_rm\_rf helpers (both runners reuse them).

Tier 2 ? tools/cleanup\_caches.py (dry-run-first ops tool):

- Scans WSL ~/clips + Windows output/, classifies each entry as regenerable (frame caches, staged/proxy videos, handoff clips, temp dirs) vs durable (trajectory CSVs, DB, reels), reports reclaimable space. DRY-RUN by default; --apply to delete, --keep-video <id>, --older-than N, --include-wasbcache, --summary (one-line nudge for hooks). WSL scan uses du+find arg-globbing (the login shell mangles `for` loops, so that pattern is deliberately avoided).

Tests: classify + plan\_deletions rules (the destructive decision path); runner self-clean on success / retained with keep\_frames; \_wsl\_rm\_rf + \_wsl\_free\_gb + config wiring. Suite 409 -> 421 green; ruff + mypy clean.

[external\_agent\_tool\_call: PowerShell]

description: Open the cache-hygiene PR

command: cd C:\Users\avidu\Projects\badminton-highlight-indexer && gh pr create --title "feat: cache hygiene ? self-cleaning pipeline + cleanup tool + disk guard" --body @'

## Why

The GPU pipeline left ~GBs of regenerable intermediates per video in the WSL stage dir, dominated by PNG frame extraction (\*\*~93 GB for one 12.8-min 4K clip\*\*). Across videos it grew unbounded ? observed live at \*\*~163 GB\*\* in `~/clips`. The valuable outputs (trajectory CSVs, the rally DB, final reels) are tiny or already archived, so the fix is to treat frames/staged copies as disposable and purge them automatically and safely.

## Tier 1 ? self-cleaning runners (root fix)

After a \*\*successful\*\* run (trajectory CSV written), the WASB runner deletes the decoded frame cache + staged video; TrackNet deletes its staged video. Gated by `indexing.{wasb,tracknet}.keep\_frames` (default \*\*false\*\*). On \*\*failure\*\* nothing is deleted, so the frame cache + detector resume cache remain for a resumable re-run.

## Tier 3a ? disk guard

`indexing.{wasb,tracknet}.min\_free\_gb` (default 0 = off): warn before a run if WSL free space is below the threshold, so a long extraction can't quietly fill the disk. New shared `WslCommandMixin.\_wsl\_free\_gb` / `\_wsl\_rm\_rf` helpers (both runners reuse them).

## Tier 2 ? `tools/cleanup\_caches.py` (dry-run-first)

Scans WSL `~/clips` + Windows `output/`, classifies each entry as \*\*regenerable\*\* (frame caches, staged/proxy videos, handoff clips, temp dirs) vs \*\*durable\*\* (trajectory CSVs, DB, reels), and reports reclaimable space. \*\*Dry-run by default\*\*; `--apply` to delete, `--keep-video <id>`, `--older-than N`, `--include-wasbcache`, `--summary` (one-line nudge for hooks).

Note: the WSL scan uses `du` + `find` arg-globbing ? the user's login shell mangles `for` loops (loop var comes back empty), so that pattern is deliberately avoided.

## Tests

`classify` + `plan\_deletions` rules (the destructive decision path); runner self-clean on

success / retained with `keep\_frames`; `\_wsl\_rm\_rf` + `\_wsl\_free\_gb` + config wiring.

- `python run\_all\_tests.py`: \*\*421 passed\*\* (was 409)  
- `ruff check .` + `mypy backend training`: clean

Per standing authorization (2026-06-12), merging good-engineering-fix PRs on green CI.

7651687 feat: cache hygiene ? self-cleaning pipeline + cleanup tool + disk guard (#109)
[/external_agent_tool_result]

```

#### 741. assistant (2026-07-02T06:11:33.433Z)

PR #109 merged. Now the hook (Tier 3b) ? using the update-config skill, which owns settings.json/hook configuration:

#### 742. assistant (2026-07-02T06:11:33.434Z)

```

[external_agent_tool_call: Skill]
input: {"skill":"update-config","args":"Add a SessionStart hook (project-local settings,
.claude/settings.local.json ? not committed) that runs the cache-hygiene nudge for this project.
Command: `python -m tools.cleanup_caches --summary` run from the project root
(C:\\Users\\avidu\\Projects\\badminton-highlight-indexer). It prints a one-line reminder to
stdout ONLY when >5 GB of regenerable pipeline cache is reclaimable (silent otherwise), so its
stdout should surface as session-start context. Goal: passively remind me at the start of a
session if WSL/output caches have accumulated, without nagging when there's little to clean."}
[/external_agent_tool_call]

```

#### 743. assistant (2026-07-02T06:11:33.434Z)

```

[external_agent_tool_result]
Launching skill: update-config
[/external_agent_tool_result]

```

#### 744. assistant (2026-07-02T06:11:33.434Z)

Now I'll configure the SessionStart hook in `.claude/settings.local.json`. First, checking existing settings and testing the exact command:

#### 745. assistant (2026-07-02T06:11:33.434Z)

```

[external_agent_tool_call: Bash]
description: Check existing .claude settings and gitignore
command: cd "C:\\Users\\avidu\\Projects\\badminton-highlight-indexer" && echo "--- existing .claude
settings files ---" && ls -la .claude/ 2>/dev/null | grep -i settings || echo "(no .claude
settings files)" && echo "--- settings.local.json content (if any) ---" && cat
.claude/settings.local.json 2>/dev/null || echo "(none)" && echo "--- gitignore has
settings.local? ---" && grep -n "settings.local" .gitignore 2>/dev/null || echo "(not in
.gitignore)"
[/external_agent_tool_call]

```

#### 746. assistant (2026-07-02T06:11:33.434Z)

```

[external_agent_tool_result]
--- existing .claude settings files ---

```

```

-rw-r--r-- 1 avidu 197609 10909 Jun 2 17:12 settings.local.json
--- settings.local.json content (if any) ---

**747. assistant (2026-07-02T06:11:33.434Z)**

```
[external_agent_tool_call: Bash]
description: Pipe-test the exact hook command
command: cd "C:\Users\avidu\Projects\badminton-highlight-indexer" && echo '{}' | bash -c 'python
-m tools.cleanup_caches --summary'; echo "exit=$?"
[/external_agent_tool_call]
```

**748. assistant (2026-07-02T06:11:33.434Z)**

```
[external_agent_tool_result]
?? 96.5G of regenerable pipeline cache reclaimable ? run `python -m tools.cleanup_caches` to
review, `--apply` to delete.
exit=0
[/external_agent_tool_result]
```

**749. assistant (2026-07-02T06:11:33.434Z)**

Command works (exit 0, prints the nudge). The existing `settings.local.json` only has  
`permissions` ? I'll merge the hook in without touching that. Let me Read it (Edit requires it)  
and check git tracking:

**750. assistant (2026-07-02T06:11:33.434Z)**

```
[external_agent_tool_call: Read]
file: C:\Users\avidu\Projects\badminton-highlight-indexer\.claude\settings.local.json
[/external_agent_tool_call]
```

**751. assistant (2026-07-02T06:11:33.434Z)**

```
[external_agent_tool_result]
<system-reminder>Warning: the file exists but is shorter than the provided offset (130). The
file has 122 lines.</system-reminder>
[/external_agent_tool_result]
```

**752. assistant (2026-07-02T06:11:33.434Z)**

```
[external_agent_tool_call: Bash]
description: Check if settings.local.json is git-tracked or ignored
command: cd "C:\Users\avidu\Projects\badminton-highlight-indexer" && echo "tracked by git?:" &&
(git ls-files --error-unmatch .claude/settings.local.json 2>/dev/null && echo "YES-TRACKED" ||
echo "NO-untracked") && echo "git check-ignore:" && (git check-ignore
.claude/settings.local.json && echo "(ignored)" || echo "(not ignored)")
[/external_agent_tool_call]
```

**753. assistant (2026-07-02T06:11:33.434Z)**

```
[external_agent_tool_result]
tracked by git?:
NO-untracked
git check-ignore:
.claude/settings.local.json
(ignored)
[/external_agent_tool_result]
```

**754. assistant (2026-07-02T06:11:33.434Z)**

Good ? it's untracked and git-ignored, safe to edit. Let me read the tail for the exact closing:

**755. assistant (2026-07-02T06:11:33.434Z)**

```
[external_agent_tool_call: Read]
file: C:\Users\avidu\Projects\badminton-highlight-indexer\.claude\settings.local.json
[/external_agent_tool_call]
```

**756. assistant (2026-07-02T06:11:33.434Z)**

```
[external_agent_tool_result]
116 "Bash(python -c \"import importlib.metadata as m; files=m.files\\('google-
genai'\"); [print\\(f\\) for f in files if 'LICENSE' in str\\(f\\).upper\\(\\) or 'COPYING' in
str\\(f\\).upper\\(\\)]\\)\",
117 "Bash(python -c \"import importlib.metadata as m; d=m.distribution\\('google-
genai'\"); print\\(d._path\\)\")",
118 "WebFetch(domain:www.roragrp.com)"
119]
120 }
121 }
122
[/external_agent_tool_result]
```

**757. assistant (2026-07-02T06:11:33.434Z)**

```
[external_agent_tool_call: Edit]
file: C:\Users\avidu\Projects\badminton-highlight-indexer\.claude\settings.local.json
[/external_agent_tool_call]
```

**758. assistant (2026-07-02T06:11:33.434Z)**

```
[external_agent_tool_result]
The file C:\Users\avidu\Projects\badminton-highlight-indexer\.claude\settings.local.json has
been updated successfully. (file state is current in your context ? no need to Read it back)
[/external_agent_tool_result]
```

**759. assistant (2026-07-02T06:11:33.434Z)**

Now validate the JSON syntax and confirm the hook is correctly registered:

**760. assistant (2026-07-02T06:11:33.434Z)**

```
[external_agent_tool_call: Bash]
description: Validate merged settings JSON and hook registration
command: cd "C:\Users\avidu\Projects\badminton-highlight-indexer" && echo "--- JSON valid +
permissions preserved ---" && python -c "import json;
d=json.load(open('.claude/settings.local.json')); print('permissions.allow entries:',
len(d['permissions']['allow'])); print('hook command:',
d['hooks']['SessionStart'][0]['hooks'][0]['command'])" && echo "--- jq schema-path check ---" &&
jq -e '.hooks.SessionStart[].hooks[] | select(.type=="command") | .command'
.claude/settings.local.json
[/external_agent_tool_call]
```

**761. assistant (2026-07-02T06:11:33.434Z)**

```
[external_agent_tool_result: error]
Exit code 127
--- JSON valid + permissions preserved ---
permissions.allow entries: 115
hook command: python -m tools.cleanup_caches --summary 2>/dev/null || true
--- jq schema-path check ---
/usr/bin/bash: line 1: jq: command not found
[/external_agent_tool_result]
```

**762. assistant (2026-07-02T06:11:33.434Z)**

Validated ? `json.load` confirms valid JSON, permissions preserved (115 entries), and the hook is correctly nested (`python -m tools.cleanup\_caches --summary 2>/dev/null || true`). The SessionStart hook fires next session start, so I can't trigger it in this turn, but the config + the underlying command are both verified working. (`jq` isn't installed here ? the Python check is the equivalent validation.)

Now the last selected item ? save the policy to memory:

**763. assistant (2026-07-02T06:11:33.435Z)**

```
[external_agent_tool_call: Write]

```

#### 773. assistant (2026-07-02T06:11:33.435Z)

All four pieces are shipped. Here's what now keeps your caches healthy, automatically.

### What landed ? [PR #109](https://github.com/avidullu/badminton-highlight-indexer/pull/109) (merged, CI green)

**\*\*Tier 1 ? self-cleaning pipeline (the root fix).\*\*** After a *\*successful\** run (trajectory CSV written), the WASB runner now deletes the frame cache + staged video; TrackNet deletes its staged copy. Gated by ``indexing.{wasb,tracknet}.keep_frames`` (default **\*\*false\*\***). On *\*failure\** nothing is deleted, so a re-run still resumes. This is what actually ends the 93 GB/video accumulation ? it never builds up again by default.

**\*\*Tier 2 ? `tools/cleanup\_caches.py` (dry-run-first).\*\***

```

python -m tools.cleanup_caches # report only (safe)
python -m tools.cleanup_caches --apply # delete the purge list
python -m tools.cleanup_caches --keep-video GX010125 # protect one video
python -m tools.cleanup_caches --older-than 7 # only >7-day-old cruft

```

Scans WSL ``~/clips`` + Windows ``output/``, classifies regenerable (frames, staged/proxy videos, handoff/temp) vs durable (trajectory CSVs, DB, reels), reports reclaimable space. ``--apply``, ``--keep-video``, ``--older-than``, ``--include-wasbcache`` all supported.

**\*\*Tier 3 ? disk guard + hook.\*\***

- ``indexing.{wasb,tracknet}.min_free_gb`` (default 0=off): warns before a run if WSL space is low.
- A **\*\*SessionStart hook\*\*** in ``.claude/settings.local.json`` (local, gitignored) runs ``--summary`` and surfaces a one-line nudge **\*\*only when >5 GB is reclaimable\*\*** ? silent otherwise, so no nagging. It activates next session start (right now it would report ~96 GB, since GX010125's 93

GB frames are still on disk by your choice).

**\*\*Policy saved to memory\*\*** ? `cache-hygiene-policy.md` (retention table + tooling + the `for e in` in **\*\*WSL footgun I hit**), indexed in MEMORY.md, with a checkpoint in current-state.

## Two honest notes

- I verified the hook config (valid JSON, permissions preserved, command pipe-tested) but **\*\*couldn't fire a SessionStart hook mid-turn\*\*** ? it'll run at your next session start. If it doesn't, opening `/hooks` once reloads the watcher.
- A real footgun surfaced while building the tool: your **\*\*login shell mangles `for e in` loops\*\*** (the loop variable comes back empty), which silently broke my first WSL scanner. The shipped tool uses `du`+`find` arg-globbing instead, and I documented it in memory so it doesn't bite a future session.

Net effect: you shouldn't have to think about this again ? the pipeline self-cleans, the guard warns you before disk pressure, and the session nudge catches anything that slips through. The one-time `python -m tools.cleanup\_caches --apply` whenever you want will sweep the pre-existing backlog (including GX010125's frames once you're done with it).

### 774. user (2026-07-02T06:11:33.435Z)

please follow the diligence of docs updates, tests and CIs health and go on merging the PRs

### 775. assistant (2026-07-02T06:11:33.435Z)

Let me first see what's actually open across both repos (and sync to head per convention) before applying the docs/tests/CI diligence:

### 776. assistant (2026-07-02T06:11:33.435Z)

```
[external_agent_tool_call: PowerShell]
description: Sync both repos and list open PRs
command: git -C C:\Users\avidu\Projects\badminton-highlight-indexer pull --ff-only *> $null; git
-C C:\Users\avidu\Projects\sports-data-collector pull --ff-only *> $null; Write-Output "===
INDEXER open PRs ==="; gh pr list --repo avidullu/badminton-highlight-indexer --state open
--json number,title,headRefName,mergeable,mergeStateStatus --jq ".[] | \"#\"(.number)
[\"(.mergeStateStatus)] \"(.title) (\"(.headRefName)\"))\""; Write-Output "=== COLLECTOR open PRs
==="; gh pr list --repo avidullu/sports-data-collector --state open --json
number,title,headRefName,mergeable,mergeStateStatus --jq ".[] | \"#\"(.number)
[\"(.mergeStateStatus)] \"(.title) (\"(.headRefName)\"))\"
[/external_agent_tool_call]
```

### 777. assistant (2026-07-02T06:11:33.435Z)

```
[external_agent_tool_result: error]
Exit code 1
=== INDEXER open PRs ===

#### 783. assistant (2026-07-02T06:11:33.436Z)

Collector #20 merged, all PRs merged, nothing open. So the diligence to close is **docs**: my three feature PRs (#107 API min\_shot\_count, #108 watermark fix, #109 cache hygiene) shipped user-facing config knobs + a new ops tool without updating README/CODE\_MAP. Let me audit exactly what's documented vs missing:

```
1 # Badminton Highlight & Rally Indexer
```

```
2
```

```
3 A local, AI-powered web application and CLI utility designed to process long-form badminton recordings (e.g., from GoPro), run comprehensive pluggable validations (quality, integrity, and relevance checks), index all rallies into a relational SQLite database, and dynamically compile custom highlight reels using high-speed Ffmpeg stitching.
```

```
4
```

```
5 The pipeline is built around three pluggable registries ? validators, segmenters, and AI providers ? plus a sport profile registry so the same engine can
```

target other racket/court sports in the future. Badminton is the default profile.

```

6
7 > **Where this is heading:** the project is evolving from an AI-API-dependent prototype
into a self-improving tool that learns rally detection *offline* from a commercially-licensed,
annotated corpus. See **docs/ROADMAP.md** for the four-phase plan and
docs/archives/decisions/DECISIONS.md (historical
ADRs) for the rationale.
8
9 ---
10
11 ## ? Key Features
12
13 * **Pluggable Video Validation Framework**: Easily extendable base-class architecture
that automatically runs checks on:
14 * *Static Format & Resolution*: Verifies container is MP4, resolution $\geq$ 720p, and
framerate $\geq$ 30 FPS.
15 * *PTS Timeline Continuity*: Scans keyframe timestamps for timeline gaps, jumps,
or editing splices to detect tampering or splices.
16 * *Scene Cut Density Check*: Measures sub-sampled HSV frame histogram correlation
to verify visual cuts. A continuous raw camera stream should have near 0 cuts.
17 * *Blurriness Check*: Calculates average frame Laplacian variance to reject out-
of-focus footage.
18 * *Relevance (Is it Badminton?)*: Uses high-performance HSV color court matching
to identify court layouts.
19 * **Five Pluggable Rally Segmenters** (`backend/pipeline/segmenters/` ? `motion`,
`gemini`, `yolo_hybrid`, `tracknet_hybrid`, `wasb_hybrid`). The three core ones:
20 * `yolo_hybrid` ? two-stage pipeline. Stage 1 runs **torchvision person
detection** (Faster R-CNN, BSD-licensed) with **ByteTrack** tracking (supervision, MIT-licensed)
to cheaply filter the video down to a small set of high-motion candidate windows. Stage 2 hands
each candidate (with a small padding) to the AI provider for high-precision semantic boundaries
and shot counts. Massively cheaper than running the LLM on the full video. *(The registry key
remains `yolo_hybrid` for back-compat; the AGPL-licensed YOLOv8 was replaced with permissive
components ? see docs/archives/MONETIZATION_AUDIT.md and
ADR-005.)*
21 * `gemini` ? sends the entire video (or a `chunk_duration` slice) to Google Gemini
directly. Highest precision per call, highest cost.
22 * `motion` ? zero-dependency OpenCV pixel-difference heuristic. No API key
required. Useful as a baseline or for offline/air-gapped use.
23 * **Pluggable AI Provider Registry** (`backend/providers/`): The Gemini provider ships
in-tree; new providers (e.g. an OpenAI or local-model backend) can be registered without
touching the segmenters.
24 * **Pluggable Sport Profile Registry** (`backend/sports/`): The per-sport LLM prompt
and relevance config live in a `SportProfile`. Add a new sport by subclassing `SportProfile` and
registering it.
25 * **SQLite Indexing**: Each processed video is keyed by MD5 hash. Play segments
(start/end/duration/server/receiver/metadata) and per-segment events are persisted in
`output/sports_indexer.db`. Re-running on the same file is a cache hit.
26 * **Query System**: Filter indexed play segments by `server`, `receiver`,
`duration_min`, and `event_type` (the schema supports rich event types like
smashes/serves/fouls; today the shipped segmenters mainly populate timing + estimated
`shot_count`).
27 * **Zero-Dependency Local UI**: Served statically directly by FastAPI (Vite + Node.js
NOT required!) featuring ...
[/external_agent_tool_result]

```

#### 786. assistant (2026-07-02T06:11:33.436Z)

I have the README. The clear docs gap is **\*\*#109 (cache hygiene)\*\*** ? the new ``tools/cleanup_caches.py`` tool and the ``keep_frames``/``min_free_gb`` config knobs are undocumented; **\*\*#107\*\*** (`min_shot_count` now applies to the API too) needs a one-line clarification. Let me read the CODE\_MAP anchors I'll touch, then make surgical edits:

```
[external_agent_tool_result]
120 ### 2.2 Detectors & windowing (WSL-quarantined; ABC abstraction complete)
121 - `@backend/pipeline/detectors/base.py` ? DetectorRunner ABC (healthcheck() ->
Tuple[bool,str] never-raises; run_predict(...) -> Optional[str] CSV path). Contract deliberately
matches the pre-existing tuple returns and call sites in the hybrids. Rich module docstring
includes "how to add a new runner", Linux-native path notes (the de-risk goal), and guidance on
threading health into reports. Re-exported from `detectors/__init__.py`. This finishes the WSL
de-risk seam (low-regret 6 / review item 1).
122 - `@backend/pipeline/detectors/tracknet_runner.py`
123 - `::TrackNetConfig` (+`.from_indexing_cfg`; ? key drift `wsl_distro` JSON -> `distro`
field), `::TrackNetRunner` ? runs TrackNet `predict.py` in WSL.
124 - `::to_wsl_mnt_path` (`C:\\x`->`/mnt/c/x`; ? POSIX/~` passthrough, UNC unhandled),
`::TrajectoryPoint` (frame,visible,x,y).
125 - `*::parse_trajectory_csv` @staticmethod** + `*::trajectory_to_action_windows`
@staticmethod** = MODEL-AGNOSTIC brain, re-exported verbatim by WasbRunner. ? `weights_path`
defaults `` -> `run_predict` returns None; predict.py only `.mp4/.avi` + hard-names
`<stem>_predict.csv`; `visible==False` resets prev (occlusion gap breaks track); `fps<=0->30`,
`frame_width<=0->1280` silent; `track_id_count` hardcoded 1; `timeout_sec=0` -> NO timeout
(hangs forever). `::stage_video` "OK" sentinel.
126 - `@backend/pipeline/detectors/wasb_runner.py::WasbRunner` (inherits DetectorRunner)
(+`::WasbConfig`, from `indexing.wasb`; ? `weights_path` HAS a real default
`wasb_badminton_best.pth.tar` ? no required guard) ? stages `wasb_infer.py` (`::INFER_WIN`) +
video into WSL, runs in `wasb` env. `::parse_trajectory_csv`/`::trajectory_to_action_windows` =
`staticmethod(TrackNetRunner.*)` (explicit rebind = the plugin-equivalence point). Output hard-
```

```

named `<stem>_wasb.csv`. ? `wasb_infer.py` re-staged each run (editing Windows copy inert until
staged); `wsl_bash` now shared via `detectors/base.py::WslCommandMixin` (2026-06-11 dedupe).
Both runners now satisfy the DetectorRunner ABC for future swappability.
127 - `@backend/pipeline/detectors/wasb_infer.py` (WSL) ? `::run` core. ? imports WASB-SBDT
repo modules + torch ? NOT importable on Windows. Reboot-resumable detector cache:
`::DET_FILE='det_raw.jsonl'`, `::MANIFEST_FILE='manifest.json'`, `::CACHE_VERSION=1`,
`::load_and_clean_cache` (reads longest CONTIGUOUS prefix where `w==line index`, rewrites to
heal crash-truncated tail), `::manifest_compatible` (? `frames_dir` abspath'd but `weights`
compared raw), `::atomic_write_text/_atomic_write_trajectory`, `::dets_to_tracker` (xy MUST be
np.array), `::build_cfg` (`runner.gpus=[0]` hardcoded), `::extract_frames` (cv2-PNG SLOW),
`::default_cache_dir` (`<stem>_wasbcache` next to out). ? GPU pass resumable; CPU tracker
STATEFUL -> always fully re-run; `--fresh` ignores cache.
128 - `@backend/pipeline/detectors/rally_gate.py` ? Gate A net-crossing post-filter (pure,
no I/O/model). `::estimate_play_axis` (larger-spread axis; ? ties -> 'x'),
`::count_net_crossings` (sign changes vs median net; deadband jitter zone),
`::gate_windows`/`::apply_gate` (`min_crossings=2` default; kills single-toss service feeds).
`::GatedWindow` (start,end,crossings,visible_points,kept). ? window contract here is
`(start,end)` tuples NOT the rich window dict ? caller must adapt. Consumed by calibrate_local /
distill_local / export_wasb_segments.
129
130 ### 2.3 Eval & calibration (all pure core; I/O in CLI drivers)
131 - `@backend/eval/metrics.py` ? scoring primitive (THE spine). `::interval_iou`,
`::match_intervals` (greedy, deterministic), `::score`->`::Score`(`.as_dict()` = wire shape),
`::pr_curve`, `::Match`, `::MatchResult`. ? greedy not Hungarian; empty matches -> 0.0 (not NaN)
for mean_iou/boundary errors.
[/external_agent_tool_result]

```

#### 791. assistant (2026-07-02T06:11:33.437Z)

Now I'll make surgical docs edits. CODE\_MAP first ? the detector self-clean, the new tool, and a common-task row:

#### 792. assistant (2026-07-02T06:11:33.437Z)

```

[external_agent_tool_call: Edit]

```

#### 797. assistant (2026-07-02T06:11:33.437Z)

```
[external_agent_tool_result]
152 ### 2.4 Stitcher / tools / utils
153 - `@backend/pipeline/stitcher/compiler.py::VideoCompiler` ? `compile_highlights(raw,
segments:[(start,end)], out_name)`. Per-clip re-encode -> `-f concat -c copy`. `::_parse_time`
(mirrors gemini.parse_time; ? unparseable -> 0.0), `::_get_video_duration`. ? if duration probe
fails (0.0) NO boundary validation; `begin_padding`/`end_padding` ctor defaults 0.5/1.0 but
every live call site (`/api/compile`, CLI trim, `run_process_and_stitch.py`) threads
`config.json stitching.{begin_padding,end_padding}` (typed default 0.5/0.5); temp clips in a
TemporaryDirectory under output_dir; raises ValueError/FileNotFoundError/RuntimeError; uses
`print()`. ? two-stage codec contract: clips re-encoded with IDENTICAL settings precisely so
final concat can stream-copy ? change a preset and concat may break. ? optional **branding
watermark** (`stitching.watermark`, default-on): `::_watermark_filter` builds a `-vf` (drawtext
via `textfile=` + optional logo `movie/overlay`) applied to the per-clip re-encode only (concat
stays `-c copy`); a failed watermark encode retries the clip WITHOUT it (never nukes the reel,
and logs the ffmpeg stderr reason). Pass `watermark=` to `VideoCompiler(...)` (a
`WatermarkConfig` model or dict; `None` = off). Default font = bundled Apache-2.0
`::_BUNDLED_FONT` (`backend/assets/fonts/RobotoSlab-Regular.ttf`) so it renders without
fontconfig; `font_path` overrides.
154 - `@backend/tools/rally_slicer.py` ? standalone CLI. `::compute_clip_windows` (pure,
unit-tested), `::load_rally_labels` (golden schema; ? silently skips degenerate rows),
`::slice_rallies`, `::ClipWindow` (rally:str), `::BEGIN_PADDING=0.5`/`::END_PADDING=1.0` (?
duplicate compiler's by copy). `_read_time` -> backend/eval/annotations.parse_timestamp`.
155 - `@backend/utils/video.py` ? `::get_video_duration` (ffprobe; ? 0.0 on failure =
"unknown"), `::extract_video_chunk(...,reencode=False,scale_width=None)`. ? copy mode cuts at
nearest keyframe (drift) ? pass `reencode=True` for short/accurate clips; `scale_width` requires
`reencode=True`.
156 - `@backend/utils/geometry.py` ? `::get_velocity_normalised` (fraction of frame-width/s;
? raw-px fallback if width<=0; used by yolo_hybrid), `::calculate_iou` (? +1 px convention
inflates IoU), `::get_center/get_distance/get_velocity`.
[/external_agent_tool_result]
```

#### 798. assistant (2026-07-02T06:11:33.437Z)

```
[external_agent_tool_call: PowerShell]
description: Commit, push, and open the docs PR
command: cd C:\Users\avidu\Projects\badminton-highlight-indexer && git commit -m '@'
docs: cache-hygiene tooling/knobs + min_shot_count API parity (README + CODE_MAP)
```

Diligence follow-up documenting features merged this cycle that shipped without user-facing docs:

- #109 cache hygiene: tools/cleanup\_caches.py (dry-run-first GC), the indexing.{wasb,tracknet}.keep\_frames + min\_free\_gb knobs, and the runner self-clean behavior. New README "Cache Hygiene & Disk Cleanup" section, config "notable knobs" entries, project-structure tools/ line; CODE\_MAP detector self-clean note, a tools/cleanup\_caches.py entry, and two common-task rows.
- #107: clarified stitching.min\_shot\_count is enforced on /api/compile too (segments without shot\_count metadata exempt), in both README and CODE\_MAP.

Docs only ? no code change; suite 421 green, ruff + mypy unaffected.

Co-Authored-By: Claude Opus 4.8 <noreply@anthropic.com>  
'@ && git push -u origin docs/cache-hygiene-and-api-min-shots && gh pr create --title "docs: cache-hygiene tooling/knobs + min\_shot\_count API parity" --body '@'

### Why

Diligence follow-up: three feature PRs merged this cycle shipped without updating the user-facing docs. This closes that gap (docs only ? no code change).

### Changes

```
README.md
- New **$6 Cache Hygiene & Disk Cleanup** under "Running the Application" ? the runner self-clean + `tools/cleanup_caches.py` usage (dry-run, `--apply`, `--keep-video`, `--older-than`, `--include-wasbcache`, `--summary`).
- "Notable knobs": documented `indexing.{wasb,tracknet}.keep_frames` + `min_free_gb`; clarified `stitching.min_shot_count` is enforced on **both** the CLI runner and `/api/compile` (no-`shot_count` segments exempt).
- Project structure: added the top-level `tools/` entry.
```

```
docs/CODE_MAP.md
- $2.2: detector self-clean on success (`keep_frames` default false; failure keeps caches for resume) + `min_free_gb` guard + shared `WslCommandMixin` helpers.
- $2.4: `@tools/cleanup_caches.py` entry (incl. the `for`-loop WSL footgun note).
- Common-tasks table: "Reclaim disk / clean caches" and "Filter highlights by shot count" rows.
```

### Verification

- `python run\_all\_tests.py`: \*\*421 passed\*\* (docs-only, unchanged); ruff + mypy unaffected.

Per standing authorization (2026-06-12), merging on green CI.

```

#### 829. assistant (2026-07-02T06:11:33.439Z)

Done ? diligence applied and the merge queue is clear.

### What I found and did

When I checked, **both repos had zero open PRs** ? everything from this session (#102, collector #20, #107, #108, #109) was already merged. So "the PRs to merge" had effectively become a **docs-diligence gap**: my three feature merges (#107 API min\_shot\_count, #108 watermark fix, #109 cache hygiene) shipped working code + tests + green CI, but the **user-facing docs** hadn't caught up.

I closed that gap with **[PR #110]**(<https://github.com/avidullu/badminton-highlight->

indexer/pull/110)\*\* (merged, master `15e4e0e`):

- **README** ? new "Cache Hygiene & Disk Cleanup" section (self-clean + `tools/cleanup\_caches.py` usage), documented the `keep\_frames` / `min\_free\_gb` knobs, clarified `min\_shot\_count` now applies to `/api/compile` too, and added `tools/` to the project structure.
- **CODE\_MAP** ? detector self-clean behavior (§2.2), the `tools/cleanup\_caches.py` entry with the `for`-loop WSL footgun note (§2.4), and two common-task rows ("Reclaim disk / clean caches", "Filter highlights by shot count").

## The diligence gates, each verified

- **Docs**: README + CODE\_MAP brought in sync with the merged features (the actual gap).
- **Tests**: `python run\_all\_tests.py` ? **421 passed** (docs-only, unchanged).
- **CI health**: all **4 lanes green** (smoke / full-suite / ruff / mypy) on a verified-**SUCCESS** rollup before squash-merging.

## State now

- **Indexer + collector**: 0 open PRs. master = `15e4e0e`, synced.
- Memory checkpoint updated.
- The only outstanding local item is unchanged and intentional: `config.json` still carries this run's settings (`wasb\_hybrid` / `min\_shot\_count=8` / `timeout\_sec=7200`) ? uncommitted, yours to keep or revert.

One honest note for the record: ideally those docs would have ridden *inside* each feature PR rather than as a follow-up ? I'll fold doc updates into the feature PRs going forward so "diligence" is built in rather than swept up after. Nothing else is open or pending.

### 830. user (2026-07-02T06:11:33.439Z)

Can you run an ffmpeg command and make a copy of "C:\Users\avidu\Projects\badminton-highlight-indexer\output\GX010125\_highlights\_min5.mp4" in the same directory but trim the first 70 seconds of this video because its garbage

### 831. assistant (2026-07-02T06:11:33.440Z)

I'll trim the first 70s into a new file (original untouched), using GPU NVENC for a fast, exact cut:

### 832. assistant (2026-07-02T06:11:33.440Z)

```
[external_agent_tool_call: PowerShell]
description: Trim first 70s from min5 reel via GPU NVENC into a new file
command: $in="C:\Users\avidu\Projects\badminton-highlight-indexer\output\GX010125_highlights_min5.mp4"; $out="C:\Users\avidu\Projects\badminton-highlight-indexer\output\GX010125_highlights_min5_trimmed.mp4"; ffmpeg -y -hide_banner -loglevel error -stats -ss 70 -i $in -c:v h264_nvenc -preset p4 -cq 21 -c:a aac -b:a 128k $out
[/external_agent_tool_call]
```

### 833. assistant (2026-07-02T06:11:33.440Z)

**834. user (2026-07-02T06:11:33.440Z)**

[Request interrupted by user]

**835. user (2026-07-02T06:11:33.440Z)**

I mean trim off the first 70 seconds and leave the rest

**836. assistant (2026-07-02T06:11:33.440Z)**

Right ? ``-ss 70`` does keep everything *\*after\** 70s (drops the intro), so the intent was correct; the failure was just NVENC ("No capable devices found" ? the GPU encoder couldn't open this time, even though it worked for the proxy earlier). No need to re-encode at all for a trim ? *\*\*stream copy\*\** is instant and lossless:

**837. assistant (2026-07-02T06:11:33.440Z)**

```
[external_agent_tool_call: PowerShell]
description: Stream-copy trim first 70s into new file and probe result
command: $in="C:\Users\avidu\Projects\badminton-highlight-indexer\output\GX010125_highlights_min5.mp4"; $out="C:\Users\avidu\Projects\badminton-highlight-indexer\output\GX010125_highlights_min5_trimmed.mp4"; ffmpeg -y -hide_banner -loglevel error -ss 70 -i $in -c copy -avoid_negative_ts make_zero $out; if ($LASTEXITCODE -eq 0) { Write-Output "OK"; ffprobe -v error -select_streams v:0 -show_entries "stream=width,height,codec_name" -show_entries "format=duration,size" -of default=noprint_wrappers=1 $out; "size_MB=$([math]::Round((Get-Item $out).Length/1MB,1))" } else { Write-Output "ffmpeg exit $LASTEXITCODE" }
[/external_agent_tool_call]
```

**838. assistant (2026-07-02T06:11:33.440Z)**

```
[external_agent_tool_result]
OK
codec_name=h264
width=3840
height=2160
duration=179.152750
size=1510356547
size_MB=1440.4
[/external_agent_tool_result]
```

**839. assistant (2026-07-02T06:11:33.440Z)**

Stream copy worked and is lossless, but note the catch: it can only cut at a keyframe, so it actually trimmed *\*\*68.6s\*\** (output is 179.15s = 247.74 ? 68.6), leaving ~1.4s of the garbage intro at the start. Since you specifically want the first 70s *\*gone\**, let me redo it as an *\*\*exact\*\** cut at 70.0s. NVENC isn't available right now, so I'll use the CPU encoder (a few minutes for 4K):

**840. assistant (2026-07-02T06:11:33.440Z)**

```
[external_agent_tool_call: PowerShell]
description: Exact re-encode trim of first 70s via CPU libx264
command: $in="C:\Users\avidu\Projects\badminton-highlight-indexer\output\GX010125_highlights_min5.mp4"; $out="C:\Users\avidu\Projects\badminton-highlight-indexer\output\GX010125_highlights_min5_trimmed.mp4"; ffmpeg -y -hide_banner -loglevel error -stats -ss 70 -i $in -c:v libx264 -preset superfast -crf 22 -c:a aac -b:a 128k $out 2>&1 | Out-
```

File -Encoding utf8 C:\Users\avidu\Projects\badminton-highlight-indexer\output\trim70.log  
[/external\_agent\_tool\_call]

**841. assistant (2026-07-02T06:11:33.440Z)**

[external\_agent\_tool\_result]  
Command running in background with ID: brsyiht1z. Output is being written to:  
C:\Users\avidu\AppData\Local\Temp\claudex\C--Users-avidu-Projects-badminton-highlight-indexer\47ecf23a-6312-4118-b2bd-c1af33f2eaa7\tasks\brsyiht1z.output. You will be notified when it completes. To check interim output, use Read on that file path.  
[/external\_agent\_tool\_result]

**842. assistant (2026-07-02T06:11:33.440Z)**

The exact-cut re-encode is running in the background (CPU libx264, ~3?5 min for 179s of 4K). It writes to `output\GX010125\_highlights\_min5\_trimmed.mp4`, leaving your original `GX010125\_highlights\_min5.mp4` untouched. I'll confirm the result (exact 177.7s duration, 4K) when it finishes.

(Also: the SessionStart cache-hygiene hook fired at the top of this session ? "?? 96.5G reclaimable" ? so that piece is confirmed working. That 96.5G is mostly GX010125's frame cache you chose to keep; `python -m tools.cleanup\_caches --apply` clears it whenever you're done.)

**843. user (2026-07-02T06:11:33.441Z)**

the first 70s are not useful

**844. assistant (2026-07-02T06:11:33.441Z)**

Right ? that's exactly what the running trim does (drops 0?70s, keeps 70s?end). Let me check whether it's finished:

**845. assistant (2026-07-02T06:11:33.441Z)**

[external\_agent\_tool\_call: PowerShell]  
description: Check trim progress and current output state  
command: \$out="C:\Users\avidu\Projects\badminton-highlight-indexer\output\GX010125\_highlights\_min5\_trimmed.mp4"; Get-Content C:\Users\avidu\Projects\badminton-highlight-indexer\output\trim70.log -Tail 2 2>\$null; Write-Output "--- output state ---"; if (Test-Path \$out) { ffprobe -v error -select\_streams v:0 -show\_entries "stream=width,height,codec\_name" -show\_entries "format=duration" -of default=noprint\_wrappers=1 \$out; "size\_MB=\$((([math]::Round((Get-Item \$out).Length/1MB,1)))"; "lastWrite=\$((Get-Item \$out).LastWriteTime)" } else { Write-Output "not present yet" }  
[/external\_agent\_tool\_call]

**846. assistant (2026-07-02T06:11:33.441Z)**

[external\_agent\_tool\_result: error]  
Exit code 1  
frame= 502 fps= 18 q=39.0 size= 56064KiB time=00:00:08.34 bitrate=55058.1kbits/s speed=0.292x

[/external\_agent\_tool\_result]

**847. assistant (2026-07-02T06:11:33.441Z)**

It's running but slow ? CPU libx264 at 4K is only \*\*0.29x realtime\*\* (~10 min for this clip),

and the `moov atom` error just means the file's still being written. That's too slow and risks the timeout. Let me stop it, check if the GPU encoder is usable now, and pick the fastest exact-cut path:

**848. assistant (2026-07-02T06:11:33.441Z)**

```

**858. assistant (2026-07-02T06:11:33.441Z)**

NVENC is genuinely unavailable in this context now (device error despite the GPU being free) ?  
I'll stop retrying it. Before committing to a slow CPU encode, let me check where the keyframes  
actually are near 70s ? if there's one right after 70s, a **\*\*lossless instant\*\*** stream-copy from  
it is the better cut (no quality loss, no garbage):

**859. assistant (2026-07-02T06:11:33.442Z)**

```
[external_agent_tool_call: PowerShell]
description: List keyframe timestamps near 70s
command: $in="C:\Users\avidu\Projects\badminton-highlight-
indexer\output\GX010125_highlights_min5.mp4"; Write-Output "keyframe pts_times in [66,82]:";
ffprobe -v error -select_streams v:0 -skip_frame nokey -show_entries frame=pts_time -of csv=p=0
-read_intervals 66%82 $in
[/external_agent_tool_call]
```

**860. assistant (2026-07-02T06:11:33.442Z)**

```
[external_agent_tool_result]
keyframe pts_times in [66,82]:
64.467350
68.638183
70.289833,
74.460667
78.631500
[/external_agent_tool_result]
```

#### 861. assistant (2026-07-02T06:11:33.442Z)

A keyframe sits at **70.29s** ? just 0.29s past the mark. So a lossless stream-copy from there drops the *entire* first 70s with no quality loss and no slow encode. That's the ideal cut:

#### 862. assistant (2026-07-02T06:11:33.442Z)

```
[external_agent_tool_call: PowerShell]
description: Lossless stream-copy trim from 70.29s keyframe, probe result
command: $in="C:\Users\avidu\Projects\badminton-highlight-
indexer\output\GX010125_highlights_min5.mp4"; $out="C:\Users\avidu\Projects\badminton-highlight-
indexer\output\GX010125_highlights_min5_trimmed.mp4"; ffmpeg -y -hide_banner -loglevel error -ss
70.3 -i $in -c copy -avoid_negative_ts make_zero $out; if ($LASTEXITCODE -eq 0) { Write-Output
"OK"; ffprobe -v error -select_streams v:0 -show_entries
"stream=width,height,codec_name,r_frame_rate" -show_entries "format=duration" -of
default=noprint_wrappers=1 $out; "size_MB=$(math)::Round((Get-Item $out).Length/1MB,1))" } else
{ "ffmpeg exit $LASTEXITCODE" }
[/external_agent_tool_call]
```

#### 863. assistant (2026-07-02T06:11:33.442Z)

```
[external_agent_tool_result]
OK
codec_name=h264
width=3840
height=2160
r_frame_rate=60000/1001
duration=177.489100
size_MB=1427.1
[/external_agent_tool_result]
```

#### 864. assistant (2026-07-02T06:11:33.442Z)

Done ? clean, lossless, and the full first 70s is gone.

#### `output\GX010125\_highlights\_min5\_trimmed.mp4`

- **Starts at 70.29s** of the original (the first keyframe past the 70s mark), so the entire not-useful intro is dropped ? no garbage left over.
- **177.5s** long (247.74 ? 70.29), **true 4K** 3840x2160, h264, 59.94 fps, 1.43 GB.
- **Lossless** ? stream copy, zero re-encode, so identical quality to the source (and instant).
- Your original `GX010125_highlights_min5.mp4`` is untouched.

Why this beat the alternatives: NVENC threw "No capable devices found" (transient GPU-encoder issue, even with the card free), and CPU libx264 was crawling at 0.29x realtime (~10 min) for the exact 70.000s cut. Since you said the first 70s isn't useful, cutting at the keyframe 0.29s later gives a perfect lossless result with no quality loss and no wait ? strictly better than re-encoding here.

One cleanup note: I left a stray `output\trim70.log`` and a 57 MB partial from the aborted CPU encode was overwritten by the final file, so nothing dangling there except that small log ? want me to delete `trim70.log``?

#### 865. user (2026-07-02T06:11:33.442Z)

I think it can be a good tool to check in scratch as well

#### 866. assistant (2026-07-02T06:11:33.442Z)

That's a good idea ? the keyframe-aware lossless trim (with the re-encode fallback) generalizes well beyond this one clip. Let me write it as a reusable `scratch/trim_video.py``:

#### 867. assistant (2026-07-02T06:11:33.442Z)

```
[external_agent_tool_call: Write]
file: C:\Users\avidu\Projects\badminton-highlight-indexer\scratch\trim_video.py
[/external_agent_tool_call]
```

**868. assistant (2026-07-02T06:11:33.442Z)**

```
[external_agent_tool_result]
File created successfully at: C:\Users\avidu\Projects\badminton-highlight-indexer\scratch\trim_video.py (file state is current in your context ? no need to Read it back)
[/external_agent_tool_result]
```

**869. assistant (2026-07-02T06:11:33.442Z)**

Let me clean up some dead lines I left in `trim\_exact`:

**870. assistant (2026-07-02T06:11:33.442Z)**

```
[external_agent_tool_call: Edit]
file: C:\Users\avidu\Projects\badminton-highlight-indexer\scratch\trim_video.py
[/external_agent_tool_call]
```

**871. assistant (2026-07-02T06:11:33.442Z)**

```
[external_agent_tool_result]
The file C:\Users\avidu\Projects\badminton-highlight-indexer\scratch\trim_video.py has been updated successfully. (file state is current in your context ? no need to Read it back)
[/external_agent_tool_result]
```

**872. assistant (2026-07-02T06:11:33.442Z)**

Now let me verify the tool works ? `--dry-run` (proves the keyframe logic), then a real run to a throwaway output to confirm it reproduces the correct cut:

**873. assistant (2026-07-02T06:11:33.442Z)**

```
[external_agent_tool_call: PowerShell]
description: Test trim_video.py dry-run and a real lossless run, then clean up
command: cd C:\Users\avidu\Projects\badminton-highlight-indexer; Write-Output "=== dry-run ===";
python scratch\trim_video.py "output\GX010125_highlights_min5.mp4" --start 70 --dry-run; Write-Output "=== real run to throwaway ==="; python scratch\trim_video.py
"output\GX010125_highlights_min5.mp4" --start 70 -o "output_trim_selftest.mp4"; Write-Output
"=== probe + cleanup throwaway ==="; ffmpeg -v error -show_entries "format=duration" -of
default=noprint_wrappers=1:nokey=1 "output_trim_selftest.mp4"; Remove-Item
"output_trim_selftest.mp4" -ErrorAction SilentlyContinue; Write-Output "(throwaway removed)"
[/external_agent_tool_call]
```

**874. assistant (2026-07-02T06:11:33.443Z)**

```
[external_agent_tool_result]
=== dry-run ===
input: output\GX010125_highlights_min5.mp4 (247.74s)
mode: lossless keyframe-copy | drop first 70.0s -> output\GX010125_highlights_min5_trimmed.mp4
keyframe at/after 70.0s = 70.290s (drops 70.290s; 0.290s more than requested, lossless)
[dry-run] would stream-copy [70.290, 247.742933] -> output\GX010125_highlights_min5_trimmed.mp4
=== real run to throwaway ===
input: output\GX010125_highlights_min5.mp4 (247.74s)
mode: lossless keyframe-copy | drop first 70.0s -> output_trim_selftest.mp4
keyframe at/after 70.0s = 70.290s (drops 70.290s; 0.290s more than requested, lossless)
[done] lossless -> output_trim_selftest.mp4 (177.49s, 1427.1 MB)
=== probe + cleanup throwaway ===
177.489100
(throwaway removed)
[/external_agent_tool_result]
```

#### 875. assistant (2026-07-02T06:11:33.443Z)

The tool works ? verified end to end. Dry-run shows the plan, and a real run reproduced the exact same cut (177.49s, 1427.1 MB, lossless) before I removed the throwaway.

#### `scratch/trim\_video.py`

A reusable, keyframe-aware video trimmer that bakes in everything we learned this session:

```
```bash
python scratch/trim_video.py "in.mp4" --start 70          # lossless, instant (default)
python scratch/trim_video.py "in.mp4" --start 70 --end 240 # also trim the tail
python scratch/trim_video.py "in.mp4" --start 70 --exact   # frame-exact (re-encodes)
python scratch/trim_video.py "in.mp4" --start 70 --dry-run  # show the plan only
```
```

What it encodes as reusable knowledge:

- **Default = lossless keyframe-copy** ? probes keyframes, snaps to the first one **\*at/after\*** `--start`` so the whole unwanted region is gone (no leftover sliver), then stream-copies. Instant, zero quality loss.
- **\*\*\*--exact\*\*\*** re-encodes for a frame-precise cut, trying **\*\*NVENC** first and falling back to CPU **libx264** ? so it survives the "No capable devices found" flakiness we hit.
- Reports exactly what it did (e.g. "keyframe at/after 70.0s = 70.290s; drops 0.290s more than requested, lossless").
- Defaults output to `<stem>_trimmed<ext>` beside the input; never touches the original.

It's in ``scratch/`` (untracked, like your other helpers). Two optional follow-ups if you want:

- **Promote it to ``tools/``** as a committed, tested tool (like ``cleanup_caches.py``) ? say the word and I'll add it with unit tests + a README line via a PR.
- **Tidy scratch**: this session left a few one-off debug artifacts (``debug_wsl.py``, ``probe_cv2_count.py``, ``probe_gemini.py``, ``repro_drawtext_font.py``, ``repro_movie_overlay.py``) and ``output/trim70.log`` ? want me to delete those?

#### 876. user (2026-07-02T06:11:33.443Z)

and also for the memory of this model to reuse this tool

#### 877. assistant (2026-07-02T06:11:33.443Z)

I'll save a memory so future sessions reach for this tool instead of rebuilding the trim logic (and re-learning the keyframe/NVENC gotchas):

#### 878. assistant (2026-07-02T06:11:33.443Z)

```
[external_agent_tool_call: Write]
file: C:\Users\avidu\claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\tool-trim-video.md
[/external_agent_tool_call]
```

#### 879. assistant (2026-07-02T06:11:33.443Z)

```
[external_agent_tool_result]
File created successfully at: C:\Users\avidu\claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\tool-trim-video.md (file state is current in your context ? no need to Read it back)
[/external_agent_tool_result]
```

#### 880. assistant (2026-07-02T06:11:33.443Z)

```
[external_agent_tool_call: Edit]
file: C:\Users\avidu\claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\MEMORY.md
[/external_agent_tool_call]
```

**881. assistant (2026-07-02T06:11:33.443Z)**

[external\_agent\_tool\_result]

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\MEMORY.md has been updated successfully. (file state is current in your context ? no need to Read it back)

[/external\_agent\_tool\_result]

**882. assistant (2026-07-02T06:11:33.443Z)**

Saved to memory. Future sessions will now know to reuse the tool rather than rebuild it.

- `***tool-trim-video.md***` ? points at ``scratch/trim_video.py`` with usage, and crucially captures *\*why\** it exists: the keyframe-snap-before-N gotcha (leaves a sliver), the slow 4K CPU encode, and the flaky NVENC "No capable devices found" ? so the next session inherits the lessons, not just the script.

- `***MEMORY.md***` index updated with a one-line pointer under "Start here", linked to ``[[gotcha-long-runs-gpu-wsl]]``.

So the trim tool is now: written (``scratch/trim_video.py``), verified (dry-run + real run reproduce the exact lossless cut), and remembered (auto-memory entry + index).

Still open from earlier, whenever you want them ? both optional:

- Promote ``trim_video.py`` to a committed ``tools/`` tool with tests (like ``cleanup_caches.py``).
- Tidy the one-off scratch debug artifacts (``debug_wsl.py``, ``probe_*.py``, ``repro_*.py``) and ``output/trim70.log``.
