Source Extractor

Research question: "RESEARCH GOAL: Identify and eliminate every dependency that could legally or economically hinder monetizing the "badminton-highlight-indexer" project as a HOSTED API SaaS. Business model: the project runs server-side on a cloud GPU VM (NVIDIA); users upload their own badminton videos and receive auto-generated highlight reels. CRITICAL CONSTRAINT: we do NOT distribute the code or any binary to users ? everything stays server-side ? so software that is merely *hosted* on the server (invoked as a separate process, e.g. ffmpeg) is acceptable where distribution-triggered copyleft (GPL/LGPL) would NOT be triggered, BUT network/SaaS copyleft (AGPL §13) and external metered-API terms STILL apply. Preference order: permissively-licensed (Apache-2.0/MIT/BSD) and royalty-free, self-hostable components. Paid commercial licenses (e.g. Ultralytics Enterprise, codec patent licenses) are acceptable ONLY as clearly-flagged fallbacks. Output must be decision-grade with licenses verified against PRIMARY sources (actual GitHub LICENSE files, official pricing/terms pages), because this drives a real business decision ? flag any claim you could not verify.

CURRENT STACK TO AUDIT (verify each license + its SaaS implication):

- ultralytics (Python lib) + the bundled YOLOv8n.pt model weights ? believed AGPL-3.0. Confirm the license of BOTH the code and the pretrained weights, whether the AGPL network clause is triggered by a closed-source hosted service that uses ultralytics server-side, and the existence/cost/terms of the Ultralytics Enterprise license.
- google-genai SDK + the Google Gemini API (model gemini-2.5-flash). Distinguish the SDK license (Apache?) from the SERVICE terms. Confirm: (a) is commercial use of outputs allowed in a paid product; (b) does Google train on / human-review prompt+video data on the PAID/billed tier vs the free tier; (c) abuse-monitoring / data-retention terms; (d) current per-token / per-video pricing for gemini-2.5-flash (input video tokens-per-second, output) so we can sketch per-video cost.
- ffmpeg / ffprobe (system binaries, invoked as separate processes). Clarify GPL vs LGPL builds and whether pure server-side SaaS use (no distribution to users) triggers any source-disclosure obligation. SEPARATELY and importantly: video CODEC PATENT royalties for a commercial service that DECODES user-uploaded H.264/AVC and H.265/HEVC (e.g. GoPro footage) and ENCODES output ? covering MPEG-LA / Via-LA (AVC), Access Advance + Via-LA + others (HEVC) pools, AAC audio (Via-LA), what activities trigger royalties, any free thresholds (e.g. the AVC sub-100k or free-internet-broadcast provisions), and whether a small SaaS realistically incurs these. Then royalty-FREE codec alternatives for the OUTPUT we generate: AV1, VP9, Opus ? and their encoder maturity/speed on a GPU VM.
- torch, torchvision ? confirm BSD; flag that some torchvision *pretrained weights* may carry separate licenses.
- opencv-python ? confirm Apache-2.0 and that the PyPI wheel's bundled components are clean for commercial server use.
- lapx (a fork of "lap" for ByteTrack association) ? confirm license.
- Quick permissive confirmation for: fastapi, uvicorn, pydantic, jinja2, python-dotenv, numpy.

PERMISSIVE ALTERNATIVES TO RESEARCH (all must be GPU-VM-friendly and usable in a closed-source

commercial SaaS):

1. Object detection to replace ultralytics/YOLOv8 for player/person detection (and possibly shuttle): compare YOLOX (Apache-2.0), RT-DETR / RT-DETRv2 (the Baidu/Apache implementations ? NOT the Ultralytics port), PP-YOLOE, MMDetection (Apache-2.0), Detectron2 (Apache-2.0), torchvision built-in detectors (Faster R-CNN/RetinaNet/FCOS/SSD, BSD), RF-DETR (Roboflow), and D-FINE/DEIM. For EACH, verify BOTH the code license AND the pretrained-weights license (some "open" detectors like YOLO-NAS have restrictive weight licenses ? confirm). Note accuracy/speed trade-offs for person detection on sports video.
2. Shuttle/ball trajectory tracking ? VERIFY the actual repo licenses (commercial-use viability) of: WASB / WASB-SBDT ("Widely Applicable Strong Baseline" for sports ball detection), TrackNetV2 and TrackNetV3, MonoTrack, and any permissively-licensed alternative for tiny-fast-object tracking. This is the planned shuttle-tracking substrate, so its commercial-use license is high-stakes.
3. LLM / semantic rally-boundary step ? research ALL THREE strategies (the user wants all three compared):
 - (a) ELIMINATE the hosted LLM entirely: permissively-licensed temporal action segmentation / video models suitable for learning rally boundaries offline (e.g. MS-TCN/MS-TCN++, ASFormer, ActionFormer, and similar) ? verify licenses and whether they fit a from-annotations learned segmenter.
 - (b) SELF-HOST an open-weights vision-language model that can ingest video frames for semantic boundaries: compare Qwen2.5-VL, InternVL2/2.5, LLaVA-OneVision/LLaVA-Video, MiniCPM-V, VideoLLaMA ? for EACH verify the WEIGHTS license for commercial use (Apache-2.0 vs custom "research-only"/"non-commercial"/community licenses with MAU caps) and the GPU VRAM needed per size tier.
 - (c) KEEP Gemini but de-risk: summarize commercial terms, data-usage on paid tier, rate limits, and per-video cost at scale, plus other hosted-API alternatives (OpenAI, Anthropic) and how their commercial/data terms compare.

DELIVERABLE: A cited report containing (1) a per-dependency RISK TABLE ? columns: dependency, license, does-SaaS-hosting-trigger-obligations?, monetization verdict (CLEAR / WATCH / BLOCKER), recommended action; (2) a recommended FULLY-PERMISSIVE target stack that eliminates all BLOCKERS; (3) paid-license fallbacks where relevant; (4) a rough per-video processing-cost sketch on a GPU VM for each of the three LLM strategies; (5) an explicit list of the codec/patent considerations and the royalty-free output-codec recommendation. Prioritize accuracy and primary-source citations over breadth."

Fetch and extract key claims from this source:

****URL:**** <https://ai.google.dev/gemini-api/terms>

****Title:**** Gemini API data-usage terms ? Paid tier: prompts/files NOT used to improve Google products

****Found via:**** Three LLM rally-boundary strategies: offline action-segmentation, self-hosted VLM weights licenses, hosted-API terms + cost search

Task

1. Use WebFetch to retrieve the page content.
2. Assess source quality: primary research/institution? secondary reporting? blog/opinion? forum? unreliable?
3. Extract 2-5 FALSIFIABLE claims that bear on the research question. Each claim must:
 - be a concrete, checkable statement (not vague generalities)
 - include a direct quote from the source as support
 - be rated central/supporting/tangential to the research question
4. Note publish date if available.

If the fetch fails or the page is irrelevant/paywalled, return claims: [] and sourceQuality: "unreliable".

Structured output only.

2. assistant (2026-05-30T03:05:04.837Z)

I'll fetch the Gemini API terms page to extract relevant claims.

3. user (2026-05-30T03:05:43.435Z)

Gemini API Data Usage Terms: Paid vs. Unpaid

Effective Date: March 23, 2026 | **Last Updated:** April 28, 2026

(a) PAID TIER - Google's Use of Data for Product Improvement

Direct Answer: No. Google does NOT use prompts, files, or responses to improve products on the paid tier.

Verbatim Quote:

> "Google doesn't use your prompts (including associated system instructions, cached content, and files such as images, videos, or documents) or responses to improve our products"

Section: "Paid Services" ? "How Google Uses Your Data"

(b) UNPAID/FREE TIER - Google's Use of Data for Product Improvement

Direct Answer: Yes. Google DOES use this data to improve products.

Verbatim Quote:

> "Google uses the content you submit to the Services and any generated responses to provide, improve, and develop Google products and services and machine learning technologies"

Section: "Unpaid Services" ? "How Google Uses Your Data"

(c) Human Review of Data

Unpaid Tier: Yes, human review occurs.

Verbatim Quote:

> "human reviewers may read, annotate, and process your API input and output. Google takes steps to protect your privacy as part of this process. This includes disconnecting this data from your Google Account"

Section: "Unpaid Services" ? "How Google Uses Your Data"

Paid Tier: No human review mentioned for product improvement purposes.

(d) Abuse Monitoring and Data Retention

Paid Tier Retention:

> "Google logs prompts and responses for a limited period of time, solely for detecting and preventing violations of the Prohibited Use Policy to maintain the safety and security"

Grounding Services (both tiers): 30-day retention for system debugging and testing.

Section: "Paid Services" ? "How Google Uses Your Data"

(e) Commercial Use of Outputs

****Verbatim Quote:****

> "Google won't claim ownership over that content. You acknowledge that Google may generate the same or similar content for others and that we reserve all rights to do so."

****Additional requirement:****

> "you'll comply with applicable law in using generated content, which may require the provision of attribution to your users when returned as part of an API call"

****Section:**** "Use of Generated Content"

Human reviewers and users assume responsibility for output usage; Google retains generation rights.

5. assistant (2026-05-30T03:07:51.758Z)

I've already completed the task. The WebFetch succeeded and I extracted the key claims, then called StructuredOutput. Let me note that the WebFetch result revealed slightly different verbatim wording and dates than my initial draft, so I'll provide a corrected StructuredOutput call to align with the actual fetched content.

6. user (2026-05-30T03:07:58.432Z)

Structured output provided successfully

7. assistant (2026-05-30T03:08:05.465Z)

Task complete. The WebFetch of <https://ai.google.dev/gemini-api/terms> succeeded (primary source ? Google's official Gemini API Additional Terms of Service, last updated 2026-04-28).

Key decision-grade findings for the LLM-strategy (c) "keep Gemini but de-risk" branch:

- Paid tier: Google does NOT use prompts/files (including videos)/responses to improve its products ? directly satisfies the data-usage concern for a paid SaaS.
- Unpaid/free tier: Google DOES use submitted content and responses for product/ML development, and human reviewers may read/annotate API input+output ? so the free tier is unsuitable for processing user-uploaded videos in a commercial product.
- Abuse monitoring: paid-tier prompts/responses are logged briefly solely for Prohibited Use Policy enforcement (not product improvement).
- Output ownership: Google won't claim ownership of generated content but reserves the right to generate similar content for others; commercial use is permitted subject to applicable-law/attribution compliance.

All claims and verbatim quotes have been returned via StructuredOutput.
