Adversarial Claim Verifier (voter 2/3)

Be SKEPTICAL. Try to REFUTE this claim. ?2/3 refutations kill it.

Research question

Identify the best LOCAL (self-hosted, single NVIDIA CUDA GPU) vision / document-AI / OCR models ? and, as a clearly-flagged approval-gated fallback only, paid cloud API services ? for parsing BANK STATEMENT PDFs into structured transaction tables (date, narration/description, withdrawal/debit, deposit/credit, running balance), for a LOCAL-FIRST personal-finance tool ("muneem").

Target documents: Indian bank statements (HDFC, Axis, ICICI, AU Small Finance) ? dense, multi-column, often SEMI-RULED or borderless tables, sometimes multiple accounts per statement; both born-digital (text layer present) and the harder cases where pdfplumber's extract_tables/coordinate clustering is unreliable (e.g. Axis, whose column layout varies between statements).

HARD CONSTRAINTS (a model that violates these is unusable for us):

1. MUST run 100% LOCALLY for statement contents (highly sensitive). NO cloud APIs by default. Paid/cloud is acceptable ONLY as an explicitly-approved fallback ? still report the best cloud options but label them clearly as "cloud/sensitive ? approval-gated, not default".
2. MUST be usable from Python (transformers / vLLM / Ollama / ONNX Runtime / native lib).
3. License MUST be permissive & commercially safe for BOTH the CODE and the MODEL WEIGHTS: MIT, BSD, Apache-2.0, ISC, HPND. AVOID and explicitly FLAG anything GPL/LGPL/AGPL, CC-BY-NC / non-commercial, research-only, or custom "community"/acceptable-use licenses with restrictions. This is critical ? many document-AI models and their training datasets are non-commercial (e.g. LayoutLMv3 weights are CC-BY-NC; Surya and Marker use GPL-or-commercial dual licensing; several VLM weights ship custom restrictive licenses). Verify the WEIGHTS license, not just the repo license.
4. Hardware: a single consumer/prosumer NVIDIA GPU. Give VRAM tiers (~8-12 GB consumer, ~16-24 GB) and which models/quantizations fit each.

Evaluate and compare these LOCAL approaches ? for each give: code license, MODEL-WEIGHTS license (state explicitly), latest release / maintenance status as of 2025-2026, VRAM need + quantization options, Python integration path, and reliability specifically on DENSE FINANCIAL TABLES / multi-column statements:

- Open vision-language models (VLMs) for document/table understanding: Qwen2-VL and Qwen2.5-VL (note per-size license ? which sizes are Apache-2.0 vs restricted), MiniCPM-V 2.6, InternVL2 / 2.5, Microsoft Phi-3.5-vision, Mistral Pixtral, Meta Llama-3.2-Vision (flag the Llama Community License restrictions), Moondream2, GOT-OCR2.0, olmOCR and other OCR-specialized VLMs.
- OCR-specialist / document-AI pipelines: PaddleOCR + PP-Structure (table recognition), docTR, EasyOCR, Tesseract (already used), Microsoft Table Transformer / TATR (check code AND PubTables-1M dataset/weights license), Donut, Surya (FLAG license), Marker (FLAG license), MinerU / PDF-Extract-Kit, RapidOCR.

- Table-structure recognition specifically (cell/grid reconstruction for borderless tables): TATR, PP-Structure, UniTable, etc.

Also assess: for SEMI-RULED / borderless bank tables, is a prompt-driven VLM (page image -> JSON transactions) more reliable than a classic OCR + table-structure pipeline? What are the accuracy/hallucination risks of VLMs on financial NUMBERS (transposed digits, dropped/duplicated rows), and how should output be VERIFIED? (muneem already machine-checks parses by balance reconciliation ? opening + sum(deposits) - sum(withdrawals) == closing, plus per-row running-balance walks and cross-checks against the bank's printed summary ? so any model's output can be automatically validated, which should inform the recommendation.)

Finally, briefly cover the best PAID/CLOUD fallbacks (clearly flagged approval-gated for sensitive data): AWS Textract (AnalyzeExpense / Tables), Google Document AI, Azure AI Document Intelligence, Reducto, LlamaParse, Anthropic/OpenAI vision ? note any self-hosting option and data-handling terms.

Deliver a RANKED shortlist of the most promising LOCAL options for muneem (NVIDIA GPU, Python, commercial-license-safe), each with license (code + weights), VRAM tier, maturity, strengths/weaknesses for dense bank-statement tables, and a concrete recommendation: which local model(s) to prototype for muneem's statement parsing and how they'd combine with the existing deterministic parsers + balance-reconciliation verification (e.g. VLM as a fallback/cross-check when deterministic parsing fails to reconcile). Cite sources and call out any license uncertainty explicitly.

Claim under review

"Surya's weights forbid commercial use above a revenue threshold: use 'for any purpose' is barred if the user/employer/affiliated entity generated more than the stated threshold in gross revenue in the prior year (personal/research use exempted). NOTE: the source file is internally inconsistent on the figure ? the words say 'two million US Dollars' while the parenthetical numeral reads '(\$5,000,000)'."

****Source:**** https://github.com/datalab-to/surya/blob/master/MODEL_LICENSE (primary)
****Supporting quote:**** "(a) for any purpose if You (your employer, or the entity you are affiliated with) generated more than two million US Dollars (\$5,000,000) in gross revenue in the prior year, except where Your Use is limited to personal use or research purposes;"

Checklist

1. Is the claim actually supported by the quote, or is it an overreach/misread?
2. WebSearch for contradicting evidence ? does any credible source dispute or heavily qualify this?
3. Is the source quality sufficient for the claim's strength? (extraordinary claims need primary sources)
4. Is the claim outdated? (check dates ? old claims about fast-moving fields are suspect)
5. Is this a marketing claim / press release / cherry-picked benchmark / forum speculation?

****refuted=true**** if: unsupported by quote / contradicted / low-quality source for strong claim / outdated / marketing fluff.

****refuted=false**** ONLY if: claim is well-supported, current, and source quality matches claim strength.

Default to refuted=true if uncertain.

Structured output only. Evidence MUST be specific.

2. assistant (2026-05-31T04:24:24.999Z)

I'll verify this claim by examining the primary source: the Surya MODEL_LICENSE file on GitHub.

3. assistant (2026-05-31T04:24:27.622Z)

I'll fetch the primary source directly to verify the exact license text.

4. user (2026-05-31T04:24:31.931Z)

Revenue Threshold Restriction

The exact clause states:

"for any purpose if You (your employer, or the entity you are affiliated with) generated more than two million US Dollars (\$5,000,000) in gross revenue in the prior year, except where Your Use is limited to personal use or research purposes"

****Key details:****

- ****Threshold in words:**** two million US Dollars
- ****Threshold in numerals:**** \$5,000,000
- ****Exemptions:**** Yes?personal use or research purposes are explicitly exempted from this restriction

5. user (2026-05-31T04:24:33.154Z)

Revenue Threshold Restriction

The exact text regarding gross revenue in the prior year is:

"for any purpose if You (your employer, or the entity you are affiliated with) generated more than two million US Dollars (\$5,000,000) in gross revenue in the prior year"

Note: There is a discrepancy in the document itself?the text states "two million US Dollars" but the parenthetical shows "(\$5,000,000)" (five million).

6. assistant (2026-05-31T04:24:36.098Z)

Both fetches (the GitHub blob view and the raw file) independently confirm the exact text, including the internal inconsistency. Let me verify the surrounding context to confirm the clause structure (the "(a)" prefix and the "for any purpose" wording the claim references).

7. user (2026-05-31T04:24:41.284Z)

Use Restrictions Analysis

****Location:**** Attachment A, Section 2 (Commercial)

****Relevant quotes:****

(a) "for any purpose if You (your employer, or the entity you are affiliated with) generated more than two million US Dollars (\$5,000,000) in gross revenue..."

(b) "for any purpose if You (your employer, or the entity you are affiliated with) has raised more than two million US dollars (\$5,000,000) in total equity or debt funding..."

****Confirmation:**** Yes, these are ****PROHIBITED uses****. The document explicitly states in Attachment A's opening: "You agree not to use, reproduce, modify, create or Distribute the Model...in any of the following ways," making these revenue and funding thresholds conditions under which the model **cannot** be used (except for personal use or research).

Based on the search results, here's the information about Surya OCR's licensing and commercial use terms:

License Structure

The Surya code is licensed under Apache 2.0. The model weights use a modified AI Pubs Open Rail-M license (free for research, personal use, and startups under \$5M funding/revenue).

Commercial Use

For broader commercial licensing of the model weights, visit our pricing page. Organizations that exceed the \$5 million threshold for funding or revenue will need to obtain a commercial license.

Developer Information

Surya is developed by DataLab (datalab-to), as evidenced by the official GitHub repository and Hugging Face models. The project is maintained by Vikram Paruchuri/Vikas, with contact information available at surya@vikas.sh for commercial licensing inquiries.

Key Features

Surya is a comprehensive OCR solution that handles OCR, Layout, Order, and Table recognition across multiple languages, making it suitable for various document processing applications while remaining accessible to researchers, individuals, and early-stage startups under the revenue threshold.

REMINDER: You MUST include the sources above in your response to the user using markdown hyperlinks.

9. assistant (2026-05-31T04:24:56.861Z)

I have sufficient evidence. Let me evaluate the claim against the verification checklist.

The claim asserts two things:

1. Surya's weights forbid commercial "for any purpose" use if the user/employer/affiliated entity generated more than the stated threshold in gross revenue in the prior year, with personal/research use exempted.
2. The source file is internally inconsistent: words say "two million US Dollars" while the parenthetical reads "(\$5,000,000)".

Evidence gathered:

- Two independent fetches (GitHub blob view + raw githubusercontent.com) both return the identical verbatim text: "(a) for any purpose if You (your employer, or the entity you are affiliated with) generated more than two million US Dollars (\$5,000,000) in gross revenue in the prior year, except where Your Use is limited to personal use or research purposes".
- The structural context confirms this is a Use Restriction (prohibited use): the section opens with "You agree not to use, reproduce, modify, create or Distribute the Model... in any of the following ways," confirming the revenue condition is a condition under which use is barred, not permitted.
- Personal use and research purposes are explicitly exempted ? matches the claim.
- The word/numeral inconsistency ("two million" vs "\$5,000,000") is confirmed by both fetches

independently.

- An independent secondary source (WebSearch result describing the license as "free for research, personal use, and startups under \$5M funding/revenue") corroborates the practical \$5M interpretation, showing the discrepancy is real and that downstream readers take the numeral (\$5M) at face value.

The supporting quote fully supports the claim. The claim accurately flags the internal inconsistency rather than overstating a single figure ? which is precisely careful, not an overreach. Source is the primary license file, fetched two ways with matching results. Current (master branch, 2025-2026 active project). Not marketing fluff.

The only minor nuance: the claim says "use 'for any purpose' is barred if... gross revenue" ? but there is also a parallel clause (b) about equity/debt funding. The claim doesn't mention (b), but it doesn't need to; it scopes itself to the revenue clause and is accurate about it. This is not a refutation.

The claim is well-supported, current, primary-sourced, and even appropriately flags the document's own inconsistency. I cannot refute it.

10. user (2026-05-31T04:25:05.688Z)

Structured output provided successfully

11. assistant (2026-05-31T04:25:08.954Z)

Verification complete. The claim was confirmed against the primary source and could not be refuted (refuted=false, high confidence). The Surya MODEL_LICENSE text ? confirmed via two independent fetches ? bars commercial use above the revenue threshold (personal/research exempted), and the word/numeral inconsistency ("two million US Dollars" vs "(\$5,000,000)") is real and present in the file.
