Adversarial Claim Verifier (voter 3/3)

Be SKEPTICAL. Try to REFUTE this claim. ?2/3 refutations kill it.

Research question

Identify the best LOCAL (self-hosted, single NVIDIA CUDA GPU) vision / document-AI / OCR models ? and, as a clearly-flagged approval-gated fallback only, paid cloud API services ? for parsing BANK STATEMENT PDFs into structured transaction tables (date, narration/description, withdrawal/debit, deposit/credit, running balance), for a LOCAL-FIRST personal-finance tool ("muneem").

Target documents: Indian bank statements (HDFC, Axis, ICICI, AU Small Finance) ? dense, multi-column, often SEMI-RULED or borderless tables, sometimes multiple accounts per statement; both born-digital (text layer present) and the harder cases where pdfplumber's extract_tables/coordinate clustering is unreliable (e.g. Axis, whose column layout varies between statements).

HARD CONSTRAINTS (a model that violates these is unusable for us):

1. MUST run 100% LOCALLY for statement contents (highly sensitive). NO cloud APIs by default. Paid/cloud is acceptable ONLY as an explicitly-approved fallback ? still report the best cloud options but label them clearly as "cloud/sensitive ? approval-gated, not default".
2. MUST be usable from Python (transformers / vLLM / Ollama / ONNX Runtime / native lib).
3. License MUST be permissive & commercially safe for BOTH the CODE and the MODEL WEIGHTS: MIT, BSD, Apache-2.0, ISC, HPND. AVOID and explicitly FLAG anything GPL/LGPL/AGPL, CC-BY-NC / non-commercial, research-only, or custom "community"/acceptable-use licenses with restrictions. This is critical ? many document-AI models and their training datasets are non-commercial (e.g. LayoutLMv3 weights are CC-BY-NC; Surya and Marker use GPL-or-commercial dual licensing; several VLM weights ship custom restrictive licenses). Verify the WEIGHTS license, not just the repo license.
4. Hardware: a single consumer/prosumer NVIDIA GPU. Give VRAM tiers (~8-12 GB consumer, ~16-24 GB) and which models/quantizations fit each.

Evaluate and compare these LOCAL approaches ? for each give: code license, MODEL-WEIGHTS license (state explicitly), latest release / maintenance status as of 2025-2026, VRAM need + quantization options, Python integration path, and reliability specifically on DENSE FINANCIAL TABLES / multi-column statements:

- Open vision-language models (VLMs) for document/table understanding: Qwen2-VL and Qwen2.5-VL (note per-size license ? which sizes are Apache-2.0 vs restricted), MiniCPM-V 2.6, InternVL2 / 2.5, Microsoft Phi-3.5-vision, Mistral Pixtral, Meta Llama-3.2-Vision (flag the Llama Community License restrictions), Moondream2, GOT-OCR2.0, olmOCR and other OCR-specialized VLMs.
- OCR-specialist / document-AI pipelines: PaddleOCR + PP-Structure (table recognition), docTR, EasyOCR, Tesseract (already used), Microsoft Table Transformer / TATR (check code AND PubTables-1M dataset/weights license), Donut, Surya (FLAG license), Marker (FLAG license), MinerU / PDF-Extract-Kit, RapidOCR.

- Table-structure recognition specifically (cell/grid reconstruction for borderless tables): TATR, PP-Structure, UniTable, etc.

Also assess: for SEMI-RULED / borderless bank tables, is a prompt-driven VLM (page image -> JSON transactions) more reliable than a classic OCR + table-structure pipeline? What are the accuracy/hallucination risks of VLMs on financial NUMBERS (transposed digits, dropped/duplicated rows), and how should output be VERIFIED? (muneem already machine-checks parses by balance reconciliation ? opening + sum(deposits) - sum(withdrawals) == closing, plus per-row running-balance walks and cross-checks against the bank's printed summary ? so any model's output can be automatically validated, which should inform the recommendation.)

Finally, briefly cover the best PAID/CLOUD fallbacks (clearly flagged approval-gated for sensitive data): AWS Textract (AnalyzeExpense / Tables), Google Document AI, Azure AI Document Intelligence, Reducto, LlamaParse, Anthropic/OpenAI vision ? note any self-hosting option and data-handling terms.

Deliver a RANKED shortlist of the most promising LOCAL options for muneem (NVIDIA GPU, Python, commercial-license-safe), each with license (code + weights), VRAM tier, maturity, strengths/weaknesses for dense bank-statement tables, and a concrete recommendation: which local model(s) to prototype for muneem's statement parsing and how they'd combine with the existing deterministic parsers + balance-reconciliation verification (e.g. VLM as a fallback/cross-check when deterministic parsing fails to reconcile). Cite sources and call out any license uncertainty explicitly.

Claim under review

"Surya's weights forbid commercial use above a revenue threshold: use 'for any purpose' is barred if the user/employer/affiliated entity generated more than the stated threshold in gross revenue in the prior year (personal/research use exempted). NOTE: the source file is internally inconsistent on the figure ? the words say 'two million US Dollars' while the parenthetical numeral reads '(\$5,000,000)'."

****Source:**** https://github.com/datalab-to/surya/blob/master/MODEL_LICENSE (primary)
****Supporting quote:**** "(a) for any purpose if You (your employer, or the entity you are affiliated with) generated more than two million US Dollars (\$5,000,000) in gross revenue in the prior year, except where Your Use is limited to personal use or research purposes;"

Checklist

1. Is the claim actually supported by the quote, or is it an overreach/misread?
2. WebSearch for contradicting evidence ? does any credible source dispute or heavily qualify this?
3. Is the source quality sufficient for the claim's strength? (extraordinary claims need primary sources)
4. Is the claim outdated? (check dates ? old claims about fast-moving fields are suspect)
5. Is this a marketing claim / press release / cherry-picked benchmark / forum speculation?

****refuted=true**** if: unsupported by quote / contradicted / low-quality source for strong claim / outdated / marketing fluff.

****refuted=false**** ONLY if: claim is well-supported, current, and source quality matches claim strength.

Default to refuted=true if uncertain.

Structured output only. Evidence MUST be specific.

2. assistant (2026-05-31T04:24:28.313Z)

I'll verify this claim about Surya's MODEL_LICENSE. Let me fetch the primary source directly.

3. assistant (2026-05-31T04:24:30.683Z)

I'll fetch the primary source directly to verify the exact license text.

4. user (2026-05-31T04:24:35.660Z)

Commercial Use Restrictions from OpenRAIL-M License

****Commercial Restrictions:****

"for any purpose if You (your employer, or the entity you are affiliated with) generated more than two million US Dollars (\$5,000,000) in gross revenue"

****Revenue Threshold:****

"two million US Dollars (\$5,000,000) in gross revenue in the prior year"

****Funding Threshold:****

"more than two million US dollars (\$5,000,000) in total equity or debt funding"

****Exemptions:****

"except where Your Use is limited to personal use or research purposes"

****Competitive Use Restriction:****

"if You (your employer, or the entity you are affiliated with) provides or otherwise makes available any product or service that competes with any product or service offered by or made available by Licensor"

5. user (2026-05-31T04:24:36.603Z)

Commercial Use Restrictions from MODEL_LICENSE

The license contains these commercial restrictions in Attachment A, Section 2:

****Revenue threshold (first condition):****

"for any purpose if You (your employer, or the entity you are affiliated with) generated more than two million US Dollars (\$5,000,000) in gross revenue in the prior year, except where Your Use is limited to personal use or research purposes"

****Funding threshold (second condition):****

"for any purpose if You (your employer, or the entity you are affiliated with) has raised more than two million US dollars (\$5,000,000) in total equity or debt funding from any source, except where Your Use is limited to personal use or research purposes"

****Competitive product restriction (third condition):****

"for any purpose if You (your employer, or the entity you are affiliated with) provides or otherwise makes available any product or service that competes with any product or service offered by or made available by Licensor or any of its affiliates"

The license notes that "Commercial and broader use licenses may be available from Licensor" at datalab.to.

6. assistant (2026-05-31T04:24:42.401Z)

Both fetches confirm the exact text. The claim's supporting quote matches verbatim, including the internal inconsistency: "two million US Dollars (\$5,000,000)". Let me verify the substance of the claim's interpretation and check whether the "personal/research use exempted" framing is correct, since muneem is a personal-use tool.

The fetched text confirms:

1. Revenue threshold exists: "for any purpose if You... generated more than two million US Dollars (\$5,000,000) in gross revenue in the prior year"
2. The exemption: "except where Your Use is limited to personal use or research purposes"
3. The internal inconsistency: words say "two million" while the parenthetical numeral reads "(\$5,000,000)"

Let me do a secondary search to confirm the license type (OpenRAIL-M) and whether there's any dispute about this being the current license as of 2025-2026.

7. user (2026-05-31T04:24:47.544Z)

Web search results for query: "Surya datalab MODEL_LICENSE OpenRAIL-M commercial use revenue threshold million"

Links: [{"title": "surya/MODEL_LICENSE at master · datalab-to/surya", "url": "https://github.com/datalab-to/surya/blob/master/MODEL_LICENSE"}, {"title": "GitHub - datalab-to/surya: OCR, layout analysis, reading order, table recognition in 90+ languages · GitHub", "url": "https://github.com/datalab-to/surya"}, {"title": "surya-ocr · PyPI", "url": "https://pypi.org/project/surya-ocr/"}, {"title": "Datalab develops small AI models to power 'document intelligence' in the enterprise", "url": "https://www.forkable.io/p/datalab-develops-small-ai-models"}, {"title": "Datalab - Intelligent Document Processing: IDP-Software", "url": "https://idp-software.com/vendors/datalab/"}, {"title": "Open Source Licensing Modalities in Large Language Models ? Insights, Risks, and Opportunities for Enterprise Adoption | by Adnan Masood, PhD. | Medium", "url": "https://medium.com/@adnanmasood/open-source-licensing-modalities-in-large-language-models-insights-risks-and-opportunities-for-283416b2a40d"}, {"title": "Overview - Datalab Documentation", "url": "https://documentation.datalab.to/docs/on-prem/overview"}, {"title": "They've Stolen My GPL-Licensed Model!?: Toward Standardized and Transparent Model Licensing", "url": "https://arxiv.org/html/2412.11483v2"}, {"title": "Chandra OCR: The Open-Source AI That Actually Reads Tables and Handwriting Right", "url": "https://emelia.io/hub/chandra-ocr-tables-handwriting"}, {"title": "chandra/MODEL_LICENSE at master · datalab-to/chandra", "url": "https://github.com/datalab-to/chandra/blob/master/MODEL_LICENSE"}]

Based on the search results, I found the information about Surya's MODEL_LICENSE and its commercial use revenue threshold:

The Surya MODEL_LICENSE restricts commercial use for entities that have generated more than two million US Dollars (\$2,000,000) in gross revenue in the prior year, except where use is limited to personal use or research purposes. Additionally, the license also restricts use for entities that have raised more than two million US dollars (\$2,000,000) in total equity or debt funding from any source, except where use is limited to personal use or research purposes.

The license is a modified OpenRAIL-M License that is generally applicable to machine-learning models, and commercial and broader use licenses may be available from the licensor.

This two-tier licensing approach means that startups and companies under the \$2 million threshold (in either revenue or funding) can use the Surya model weights freely, while those exceeding it would need to obtain a commercial license.

REMINDER: You MUST include the sources above in your response to the user using markdown hyperlinks.

8. assistant (2026-05-31T04:24:50.844Z)

The search summary itself wrote "\$2,000,000" (treating the words "two million" as authoritative), which confirms the internal inconsistency is real and noticed by readers. The license is a modified OpenRAIL-M. Let me confirm the precise raw text one more time with a direct line-level read to nail down that the inconsistency is genuinely in the file and not a fetch artifact.

9. user (2026-05-31T04:24:54.719Z)

Here is the sentence from Section 2(a) of Attachment A:

"(a) for any purpose if You (your employer, or the entity you are affiliated with) generated more than two million US Dollars (\$5,000,000) in gross revenue in the prior year, except where Your Use is limited to personal use or research purposes;"

****Do the numerals match?****

No. The parenthetical states "\$5,000,000" while the words say "two million US Dollars." These do not match? five million ? two million.

10. assistant (2026-05-31T04:25:06.122Z)

I have triple-confirmed the claim against the primary source. Let me evaluate against the checklist.

****Checklist evaluation:****

1. ****Supported by quote?**** Yes, fully. The supporting quote is reproduced verbatim from the primary source (GitHub raw + rendered), confirmed on three independent fetches. The claim accurately states: (a) commercial "use for any purpose" is barred above a revenue threshold; (b) personal/research use is exempted ("except where Your Use is limited to personal use or research purposes"); (c) the internal inconsistency between words ("two million") and numeral ("\$5,000,000") genuinely exists in the file.
2. ****Contradicting evidence?**** None. The WebSearch summary independently arrived at the same restriction and even resolved the ambiguity toward "\$2,000,000" (using the words), corroborating both the restriction and the inconsistency. No source disputes it.
3. ****Source quality?**** Excellent ? the claim cites the primary source (the actual MODEL_LICENSE file in the official datalab-to/surya repo) and the quote is exact.
4. ****Outdated?**** No. Fetched from `master` branch on 2026-05-31 (today). Current.
5. ****Marketing/speculation?**** No. It is a verbatim license-text quote.

****Minor nuances (do not refute the claim):****

- The claim's framing "use 'for any purpose' is barred" is slightly loose ? technically only specific **commercial-scale** entities (>\$2M revenue OR >\$2M funding OR competing product) are barred from "any purpose" use; smaller entities retain broad use. But the claim explicitly caveats "(personal/research use exempted)," which is the operative point for muneem (a personal tool), so it is not misleading.
- The claim flags the inconsistency as a "NOTE," correctly characterizing it as an internal inconsistency rather than asserting a single definitive figure. This is precisely accurate and unusually careful.

The claim is well-supported, current, sourced to the primary document, and even its noted ambiguity is verified. This is not refuted.

11. user (2026-05-31T04:25:14.573Z)

Structured output provided successfully

12. assistant (2026-05-31T04:25:19.255Z)

I have completed the verification and submitted my structured output. The claim is ****not refuted**** ? it is well-supported by the primary source.

****Summary:**** I confirmed the claim against the primary source (the actual `MODEL\_LICENSE` file in the official `datalab-to/surya` repo, fetched today via three independent requests). The supporting quote matches the license text verbatim, including the genuine internal inconsistency the claim flags (words say "two million US Dollars" while the parenthetical reads "\$5,000,000"). The personal/research-use exemption is real and directly relevant to muneem as a personal-use tool. No contradicting source exists; the independent WebSearch summary corroborated the restriction.
