1. user (2026-06-07T08:15:15.722Z)

You are a tough evaluator of how DEBUGGABLE an observability report is for a README-only reader.
Scenario: indexer_motion_synthetic (tool: indexer)
GROUND TRUTH (what actually went wrong): The 'motion' segmenter was used; its per-segment metadata/events are heuristic/synthetic, not measured, so they must not be trusted as ground truth. Use yolo_hybrid or gemini for real shot metadata.
The report is expected to point the reader toward FAQ: "Q10".

THE FRESH READER ANSWERED:

```
- diagnosis: The `motion` segmenter was used, which is a zero-dependency OpenCV pixel-difference heuristic. While it successfully detected 1 segment (5 seconds of play), its per-segment metadata?intensity, speed, events (serve/smash/foul/winner), and server/receiver fields?is synthetic/heuristic, NOT measured ground truth. These are placeholder values only.  
- fix: Switch to a measured-metadata segmenter: either `yolo_hybrid` (default, cheaper) or `gemini` (more expensive, full-video). Update config.json to set "default_segmenter": "yolo_hybrid" and ensure GEMINI_API_KEY is in .env, then re-run indexing with --segmenter yolo_hybrid (or let it use the config default).  
- faq_section used: Q10: Can I trust the per-segment metadata from the `motion` segmenter?  
- could_self_debug: true  
- confusing_parts: ["The report shows validation PASS and 1 segment detected, which appears successful on the surface, so the problem is not obvious without reading the warning section", "The term 'synthetic' could be clearer upfront?phrases like 'placeholder' or 'unmeasured' would signal the problem faster than burying 'not measured' at the end of a sentence", "The report shows candidate_windows: 0 but segment_count: 1, which is unintuitive?unclear if this is success or failure without understanding the motion segmenter's behavior"]
```

Also read the actual report for context:

C:\Users\avidu\AppData\Local\Temp\obseval\reports\indexer_motion_synthetic.report.md

Judge strictly: did the reader land on the correct ROOT CAUSE (cause_correct)? Did they find/consult the expected FAQ (faq_correct)? How large is the remaining gap (none/minor/major)? Then propose ONE concrete, specific refinement to the REPORT wording, the spec rule message, or the FAQ that would have made this scenario unambiguous to self-debug ? or "none" if it is already excellent. Don't be generous; if anything was confusing, propose a fix.

2. assistant (2026-06-07T08:15:18.322Z)

I'll read the actual report to judge how well it supports a README-only reader's self-debugging.

4. assistant (2026-06-07T08:15:23.634Z)

I have enough context. Let me evaluate against the ground truth.

The reader correctly identified the root cause: the `motion` segmenter's per-segment metadata is heuristic/synthetic, not measured, and must not be trusted as ground truth; the fix is to switch to `yolo\_hybrid` or `gemini`. They also consulted the expected FAQ (Q10) ? which the report explicitly points to via `see README#Q10`.

Now let me assess the gap. The reader self-debugged correctly and landed on the right cause and

FAQ. Their confusing_parts are legitimate observability friction points worth a refinement.

5. user (2026-06-07T08:15:34.038Z)

Structured output provided successfully

6. assistant (2026-06-07T08:15:37.025Z)

Evaluation complete. The reader landed on the correct root cause and consulted the expected FAQ Q10. The gap is minor ? driven by the report's surface-success framing (PASS, segment_count=1) hiding the problem in prose-only WARN text rather than at the field level.
