You are a tough evaluator of how DEBUGGABLE an observability report is for a README-only reader.
Scenario: collector_noncommercial (tool: collector)
GROUND TRUTH (what actually went wrong): The imported video has a non-commercial license, so it is EXCLUDED from the default commercial-only export. It stays in the DB but won't appear downstream unless exported with --include-noncommercial.
The report is expected to point the reader toward FAQ: "will-a-non-commercial-license-block-export".

THE FRESH READER ANSWERED:

```
- diagnosis: The video cc_match is licensed under CC-BY-NC-SA (non-commercial license). The report correctly identifies this with a license_noncommercial warning. The video will be excluded from the default export because is_commercial=False, as stated in the report and documented in the FAQ.
- fix: Run the export command with the --include-noncommercial flag to include this video in the export: python -m src.cli.curate export --out-dir data/eval_export --include-noncommercial
- faq_section used: Will a non-commercial license block export?
- could_self_debug: true
- confusing_parts: []
```

Also read the actual report for context:

C:\Users\avidu\AppData\Local\Temp\obseval\reports\collector_noncommercial.report.md

Judge strictly: did the reader land on the correct ROOT CAUSE (cause_correct)? Did they find/consult the expected FAQ (faq_correct)? How large is the remaining gap (none/minor/major)? Then propose ONE concrete, specific refinement to the REPORT wording, the spec rule message, or the FAQ that would have made this scenario unambiguous to self-debug ? or "none" if it is already excellent. Don't be generous; if anything was confusing, propose a fix.

2. assistant (2026-06-07T08:14:51.297Z)

I'll read the actual report to evaluate the reader's answer against ground truth.

4. assistant (2026-06-07T08:14:59.779Z)

The reader's answer aligns with the report and ground truth. Let me evaluate strictly.

The ground truth: non-commercial license excludes the video from default commercial-only export; it stays in DB; needs `--include-noncommercial`. Expected FAQ: "will-a-non-commercial-license-block-export".

The reader's diagnosis correctly identifies CC-BY-NC-SA, `is\_commercial=False`, exclusion from default export, and the FAQ. The fix correctly proposes `--include-noncommercial`. They consulted the exact expected FAQ. `could\_self\_debug: true`, no confusing parts.

This is a strong match. The report is clear: the WARN message states the cause, consequence, remedy, FAQ anchor, and evidence. Both `cause\_correct` and `faq\_correct` are true, gap is none.

One minor note for a refinement: the reader's proposed export command (`python -m src.cli.curate export --out-dir data/eval\_export --include-noncommercial`) is plausibly inferred but the report itself only names the flag, not the full command. That's a self-supplied detail, not from the report ? but it's reasonable and not an error. The report is essentially excellent for this scenario.

5. user (2026-06-07T08:15:04.741Z)

Structured output provided successfully

6. assistant (2026-06-07T08:15:07.042Z)

Evaluation complete. The reader landed on the correct root cause and consulted the exact expected FAQ; the report is already unambiguous for this scenario, so no refinement is needed.
