1. user (2026-06-07T08:14:09.402Z)

You are a tough evaluator of how DEBUGGABLE an observability report is for a README-only reader.
Scenario: collector_overlap (tool: collector)
GROUND TRUTH (what actually went wrong): The delivery is blocked because two rallies overlap in time (rally 1 ends at 7.00s but rally 2 starts at 6.00s). Rallies must be disjoint; the vendor/reviewer must fix rally 1's end or rally 2's start before it can be imported.
The report is expected to point the reader toward FAQ: "what-does-validation-check".

THE FRESH READER ANSWERED:

```
- diagnosis: Rally 1 ends at 7.00 seconds, and Rally 2 starts at 6.00 seconds. This means their time intervals overlap by 1.00 second (Rally 1 should have ended before Rally 2 began). The `overlap` validation check is a blocker because two rallies' intervals must be disjoint ? the end time of one rally must not be greater than the start time of the next rally. This is a data error in the input annotations: the rally boundaries have not been correctly separated in time.  
- fix: Correct the CSV so that the two rallies' time intervals no longer overlap. Either: (1) move Rally 1's end_time to 6.00 seconds or earlier, or (2) move Rally 2's start_time to 7.00 seconds or later. Then re-run `validate-delivery` to confirm the blocker is gone before proceeding to `import-local`.  
- faq_section used: What does validation check? (the table with `overlap` listed as a blocker severity check)  
- could_self_debug: false  
- confusing_parts: ["The report says 'Rally 1 (ends 7.00s) overlaps Rally 2 (starts 6.00s)' but does not explicitly state whether you should shorten Rally 1 or extend Rally 2's start, or offer any guidance on which is more likely correct. You must open the video yourself to see which rally boundary is actually wrong.", "The report gives the overlap duration (1.00s) but no frame-level detail, so if you're working from frame numbers in CVAT, you'd need to convert back (frames = seconds × fps = 1.00 × 59.94 ? 60 frames) to know how many frames to adjust.", "The report references 'rally_number=2' in the evidence but does not clarify whether that means Rally 2 is the problem or both are. From the FAQ wording, either boundary could be wrong ? you must inspect the video to judge."]
```

Also read the actual report for context:

C:\Users\avidu\AppData\Local\Temp\obseval\reports\collector_overlap.report.md

Judge strictly: did the reader land on the correct ROOT CAUSE (cause_correct)? Did they find/consult the expected FAQ (faq_correct)? How large is the remaining gap (none/minor/major)? Then propose ONE concrete, specific refinement to the REPORT wording, the spec rule message, or the FAQ that would have made this scenario unambiguous to self-debug ? or "none" if it is already excellent. Don't be generous; if anything was confusing, propose a fix.

2. assistant (2026-06-07T08:14:11.975Z)

I'll read the actual report to evaluate it against the reader's response.

4. assistant (2026-06-07T08:14:31.810Z)

Now I have the full picture. Let me evaluate the report against the reader's response and ground truth.

The reader correctly identified:

- Root cause: Rally 1 ends at 7.00s, Rally 2 starts at 6.00s, 1.00s overlap, rallies must be disjoint, data error in annotations. This exactly matches ground truth.
- FAQ: They consulted "What does validation check?" which is the expected `what-does-validation-check` FAQ.
- Fix: Correct CSV so intervals don't overlap, re-run validate-delivery. Correct.

However, `could\_self\_debug: false`. Let me assess why and whether the gap is real.

The reader's confusing parts are legitimate but mostly reflect inherent ambiguity in the data (which boundary is "correct" genuinely can't be known without the video). However, two are addressable in the report:

1. No frame-level detail (they had to manually compute frames = $1.00 \times 59.94 \approx 60$ frames). The report knows the FPS and the source format is CVAT (frame-based), so it could surface frame

numbers.

2. The evidence `rally\_number=2` is ambiguous about whether Rally 2 is "the problem."

The reader landed on the exact root cause and the exact FAQ. The gap is "minor" ? they fully understood the cause and the fix space; the only thing blocking confident self-debug is not knowing which boundary to move, which is inherent to the data, plus the frame-conversion friction which IS fixable.

5. user (2026-06-07T08:14:35.693Z)

Structured output provided successfully

6. assistant (2026-06-07T08:14:39.856Z)

Evaluation complete. The reader landed on the correct root cause and consulted the expected FAQ. Gap assessed as minor ? the only fixable friction was the lack of frame-level detail in the overlap finding, addressed by the proposed refinement.
