1. user (2026-06-07T08:13:58.712Z)

You are a USER of a sports-video tool who has read ONLY its README/FAQ ? you have NEVER seen the source code. A processing run looks wrong and the tool wrote a per-video report. Read EXACTLY these two files and NOTHING else (do not open source code or any other file):

1. The README/FAQ: C:\Users\avidu\Projects\sports-data-collector\docs\INGESTION_PIPELINE.md
2. The tool's technical report for the suspicious run:
C:\Users\avidu\AppData\Local\Temp\obseval\reports\collector_missed_rally.report.md

Using ONLY those two, tell me: what went wrong, exactly what you'd do to fix it, and which FAQ section (by heading text or Q-number) you used. Be honest about whether you could truly self-debug this from the report alone, and list anything in the report that was confusing, ambiguous, or under-explained.

2. assistant (2026-06-07T08:14:03.219Z)

I'll read the two specified files to understand the issue.

3. user (2026-06-07T08:14:03.433Z)

```
1      # Rally Ingestion Pipeline ? End-to-End FAQ
2
3      How a vendor's rally annotations become training/eval ground truth, and how we
4      validate each delivery against our conventions. This is the operational companion
5      to the annotation spec (`docs/annotation/ROORA_BRIEF.md` + `ANNOTATION_GUIDE.md`).
6
7      ...
8      vendor delivery                OUR side (collector)                modeling

24
25     ## The four commands (in order)
26
27     ```bash
28     # 1. Normalise a CVAT export ? our canonical per-rally CSV (skip if the vendor sent a
CSV)
29     python -m src.cli.curate convert-cvat --input job.xml \
30         --video-path match.mp4 --out canonical.csv --issues issues.txt
31
32     # 2. Validate the delivery ? report + annotatable review sheet (the QA gate)
33     python -m src.cli.curate validate-delivery --input job.xml \
34         --video-path match.mp4 --video-id pilot_badminton_01 --out-dir data/validation
35     # ...or validate a CSV directly:
36     python -m src.cli.curate validate-delivery --csv canonical.csv --video-id
pilot_badminton_01
37
38     # 3. After human review, import the (corrected) CSV into the DB
39     python -m src.cli.curate import-local --sport badminton \
40         --video-path match.mp4 --annotations-path canonical.csv --fps 59.94
41
42     # 4. Export indexer-ready ground truth (start,end CSVs + manifest)
43     python -m src.cli.curate export --out-dir data/eval_export
44     ```
45
46     ---
47
48     ## FAQ
49
50     ### What delivery formats do we accept?
51     Both. A CVAT export (image- or track-mode XML ? rally fields carried as box
52     attributes) is normalised by `convert-cvat`; an already-canonical CSV is taken
53     as-is. Vendors may keep working in CVAT ? we do not require them to hand-author
54     CSVs.
55
56     ### What is the "canonical" CSV?
57     One row per rally:
58     `rally_number, start_mmss, end_mmss, start_time, end_time, shots_count, ending_reason,
59     last_shot_outcome, score_before, score_after, notes`.
60     `start_time`/`end_time` are decimal seconds; `import-local` reads those.
61
62     ### How are timestamps handled? (the fps thing)
63     We recompute each rally's interval from its frame range × the true fps
64     (`seconds = frame / fps`). A vendor's CVAT time attributes are ignored ? a
65     step-sampled job that assumes 30 fps writes systematically wrong times. fps comes
66     from `--fps` or ffprobe of `--video-path`. `mm:ss` is also accepted everywhere.
67
68     ### What does validation check?
69     | code | severity | meaning |
70     |---|---|---|
71     | `overlap` | blocker | two rallies' intervals overlap (`end[N] > start[N+1]`) |
72     | `zero_duration` | blocker | `end <= start` (single-sample / stray box) |
73     | `frame_out_of_range` | high | a box frame is past the video's last frame |
74     | `shot_density` | medium | long rally with implausibly few shots ? likely an inflated
span** (often hides a merged rally) |
75     | `possible_missed_rally` | medium | a long unlabeled gap between two rallies ? check
for an omitted rally |
76     | `ending_reason_vocab` | medium | `ending_reason` outside the agreed set |
77     | `outcome_vocab` | low | `last_shot_outcome` outside `{in,net,out,n_a}` |
78
79     ### Blocker vs. review ? what's the gate?
80     `validate-delivery` exits non-zero if any blocker exists** (so it can gate a bulk
81     loop / CI). Non-blocker issues don't stop the gate but populate the review sheet
for the human pass. `import-local` independently rejects overlaps/zero-duration, so

```

```

82     bad ground truth can't slip into the DB.
83
84     ### How are *missed rallies* caught? (the worst error)
85     Two complementary checks, because a miss shows up two ways:
86     1. Clean omission (a real hole in the timeline) ? `possible_missed_rally` (gap
heuristic).
87     2. Merged/inflated (the missed rally got swallowed into a neighbour's box, leaving
88         no gap) ? `shot_density` flags the over-long, under-shot rally, and the human finds
89         the second rally inside it.
90     Neither is a guarantee ? they surface regions to review, they don't certify
91     completeness. (A future enhancement: a motion second-opinion over the raw video.)
92
93     ### What's the review sheet?
94     `_review.csv` ? one row per rally with `auto_flags` (which checks fired) plus
95     blank `VERIFIED` / `true_start_mmss` / `true_end_mmss` / `true_ending_reason` /
96     `true_last_shot_outcome` / `reviewer_comment` columns. Open it next to the video
97     (timestamp overlay on) and fill the flagged rows. This is the human gate that turns
98     a delivery into trusted golden labels.
99
100    ### Why two ending fields (`ending_reason` + `last_shot_outcome`)?
101    They're orthogonal: `ending_reason` is why the point ended (winner / forced_error /
102    unforced_error / service_fault / let / other); `last_shot_outcome` is where the
103    last shot went (in / net / out / n_a). A shuttle that flew long is
104    `forced_error/unforced_error` + `out` ? both kept, no information lost.
105
106    ### How do I onboard a brand-new video?
107    1. Get fps into the intake manifest (we provide it to the vendor).
108    2. `convert-cvat` (if CVAT) ? `validate-delivery` ? read the report, fill the review
109        sheet for flagged rallies ? correct the CSV ? `import-local` ? `export`.
110    3. The same suite runs for every video, so quality stays consistent at scale.
111
112    ### How do I pull a single rally out to eyeball it?
113    The slicer (indexer):
114    ```bash
115    python -m backend.tools.rally_slicer --video match.mp4 \
116        --labels golden_labels.csv --rallies 7,16 --out-dir output/rally_clips
117    ```
118    Clips are padded to match the highlight compiler (0.5s lead / 1.0s tail).
119
120    ### Does coarse frame sampling hurt boundaries?
121    Not in practice: ~0.5s sampling slack is absorbed by the highlight compiler's clip
122    padding, so we don't flag sampling density.
123
124    ### Will a non-commercial license block export?
125    The video is kept in the DB regardless of license, but the default `export` is
126    commercial-only ? a non-commercial source (e.g. `CC-BY-NC-SA`) is excluded
127    from the eval/training set unless you pass `--include-noncommercial`. So if a video
128    "goes missing" downstream, check its `is_commercial` flag first. (The observability
129    report raises a `license_noncommercial` warning for exactly this case.)
130
131    ### What is the observability report? (*.report.json` / `*.report.md` / `*.summary.md`)
132    Every `validate-delivery`, `convert-cvat`, and `import-local` run now also writes a
133    per-video observability report (next to the video for `import-local`; into the
134    `--out-dir` / next to the canonical CSV otherwise):
135    - <id>.report.json ? machine-readable: every stage, metric, and finding. Diff
136        two runs to see what changed between deliveries.
137    - <id>.report.md ? the technical report: parse / validation / registration
138        stages plus findings (one per delivery issue, each citing this FAQ). Read this
139        to debug a delivery.
140    - <id>.summary.md ? a delivery summary for the vendor / data team: the
141        rally count and coverage plus the plain-language list of rallies to review ? no
142        internal codes or severities.
143    This is in addition to the existing `_report.md` / `_report.json` / `_review.csv`
144    (the human review sheet), which are unchanged.
145

1      # Sports Data Collector ? Delivery / Ingestion Report
2
3      ## Run
4
5      | Field | Value |
6      | --- | --- |
7      | Tool | sports-data-collector |
8      | Video id | pilot_gap (human_id) |
9      | Generated | 2026-06-07T08:10:51Z |
10     | Schema | 1.0 |
11
12     ## Video
13
14     | Field | Value |
15     | --- | --- |
16     | Duration | 10m00s |
17     | FPS | 59.94 fps (declared) |
18
19     ## Processing stages
20
21     **parse** ? `ok` (0.0s)
22     - rallies_parsed: 3
23     - _source_format_: cvat
24     - _fps_: 59.94
25     - _sampling_step_: None
26
27     **validation** ? `warn` (0.0s)
28     - issues_blocker: 0
29     - issues_high: 0
30     - issues_medium: 1
31     - issues_low: 0
32     - n_blockers: 0
33     - _gate_: PASS
34
35     ## Findings & issues
36
37     - [WARN] **possible_missed_rally** ? 26.0s of unlabeled time between Rally 2 (ends
14.0s) and Rally 3 (starts 40.0s) ? check for an unlabeled rally in the gap.
38     ? see **docs/INGESTION_PIPELINE.md#what-does-validation-check**
39     ? evidence: rally_number=3
40
41     ## Verdict
42
43     **PASS (with warnings)**
44
```

5. assistant (2026-06-07T08:14:04.797Z)

Now I'll analyze these two files to provide the answer.

6. user (2026-06-07T08:14:15.101Z)

Output does not match required schema: root: must have required property 'diagnosis', root: must have required property 'fix', root: must have required property 'faq_section', root: must have required property 'could_self_debug', root: must have required property 'confusing_parts'

7. assistant (2026-06-07T08:14:16.416Z)

Let me provide the structured analysis:

8. user (2026-06-07T08:14:26.366Z)

Output does not match required schema: root: must have required property 'diagnosis', root: must have required property 'fix', root: must have required property 'faq_section', root: must have required property 'could_self_debug', root: must have required property 'confusing_parts'

9. user (2026-06-07T08:14:36.073Z)

10. assistant (2026-06-07T08:14:37.558Z)

Let me call the tool with the required parameters:

11. user (2026-06-07T08:14:43.313Z)

Output does not match required schema: root: must have required property 'diagnosis', root: must have required property 'fix', root: must have required property 'faq_section', root: must have required property 'could_self_debug', root: must have required property 'confusing_parts'

12. assistant (2026-06-07T08:14:45.370Z)

Let me provide the proper structured output:

13. user (2026-06-07T08:14:51.804Z)

Output does not match required schema: root: must have required property 'diagnosis', root: must have required property 'fix', root: must have required property 'faq_section', root: must have required property 'could_self_debug', root: must have required property 'confusing_parts'

14. assistant (2026-06-07T08:14:52.914Z)

Let me try with explicit parameter values:

15. user (2026-06-07T08:14:52.916Z)

Output does not match required schema: root: must have required property 'diagnosis', root: must have required property 'fix', root: must have required property 'faq_section', root: must have required property 'could_self_debug', root: must have required property 'confusing_parts'

16. assistant (2026-06-07T08:14:53.951Z)

I need to pass the parameters as JSON. Let me structure this properly:

17. user (2026-06-07T08:15:01.776Z)

Output does not match required schema: root: must have required property 'diagnosis', root: must have required property 'fix', root: must have required property 'faq_section', root: must have required property 'could_self_debug', root: must have required property 'confusing_parts'

18. assistant (2026-06-07T08:15:07.892Z)

Based on my analysis of the README and report, here is my finding:

****Diagnosis:****

The report shows a `possible\_missed\_rally` warning indicating a 26-second unlabeled gap between Rally 2 (ends at 14.0s) and Rally 3 (starts at 40.0s). According to the FAQ, this is a "clean omission" ? a real hole in the timeline where a rally was likely forgotten during annotation. The vendor's CVAT export is missing an entire rally in that time period.

****Fix:****

1. Open the video at the 14.0s to 40.0s interval and verify whether there is indeed a rally occurring there

2. If a rally exists, add it to the canonical CSV with the correct start_time, end_time, shots_count, ending_reason, and last_shot_outcome
3. Re-run `validate-delivery` to confirm the gap is resolved
4. Use the review sheet (`<id>\_review.csv`) to document this correction before importing

****FAQ Section Used:****

"How are *missed rallies* caught? (the worst error)" ? specifically the section explaining the two complementary checks, noting that a clean omission shows up as `possible\_missed\_rally` when there's a gap in the timeline.

****Could Self-Debug:****

Yes, absolutely. The report is clear and specific: it identifies the exact time window (14.0s to 40.0s) and the rallies bounding the gap. The FAQ explicitly explains this scenario and how to handle it.

****Confusing Parts:****

None. The report is well-structured, the finding is unambiguous, and the FAQ provides the exact context needed to understand what went wrong and why.

19. user (2026-06-07T08:15:08.027Z)

Stop hook feedback:

You did not call StructuredOutput. You MUST call StructuredOutput to return your answer ? the tool input IS your answer. Call it now.

20. assistant (2026-06-07T08:15:09.393Z)

You're right. Let me call StructuredOutput with the required parameters:

21. user (2026-06-07T08:15:10.446Z)

Structured output provided successfully
