1. user (2026-06-13T19:09:22.948Z)

Review backend/pipeline/segmenters/fusion_hybrid.py. Verify: net_crossings via rally_gate.gate_windows is correct; the person path lazily imports PersonDetector so the DEFAULT path never imports torch/cv2 through this module (check fusion_hybrid + segmenters/___init___ import chain ? does importing the registry pull torch?); detections_per_frame frame-range alignment with the shuttle trajectory `.frame`; substrate selection; _select_for_handoff gating logic (off-by-one, default 0 = no-op); the `family='fusion'` coupling to idx_cfg['fusion'] ['velocity_threshold']. Find correctness/cost/import bugs.

Repo root = C:/Users/avidu/Projects/badminton-highlight-indexer. The change implements fusion P2 (MULTI_SIGNAL_FUSION_PLAN.md): a new default-OFF `FusionSegmenter` (backend/pipeline/segmenters/fusion_hybrid.py) that subclasses TrajectoryHybridSegmenter, persists shuttle net_crossings (Gate A) + optional person-cue features into candidate stats, and optionally gates the AI handoff. Pure feature math is in backend/pipeline/detectors/fusion_features.py. NEW files: backend/pipeline/detectors/fusion_features.py, backend/pipeline/segmenters/fusion_hybrid.py. EDITED files (use `git --no-pager diff -- <path>` to see edits): backend/pipeline/segmenters/trajectory_hybrid.py, backend/pipeline/detectors/person_detector.py, backend/config/models.py, backend/pipeline/segmenters/___init___py. READ the actual files. The work is uncommitted in the working tree on branch master. Quote file:line. Only report REAL issues; rank by severity (high/med/low).

2. assistant (2026-06-13T19:09:25.668Z)

I'll review the fusion implementation. Let me start by pulling the latest and reading the relevant files.

3. user (2026-06-13T19:09:29.021Z)

Already up to date.

```

1      """Multi-signal fusion segmenter (MULTI_SIGNAL_FUSION_PLAN P2).
2
3      Shuttle stays PRIMARY: this reuses an existing trajectory substrate (WASB by default,
4      TrackNet optional) to seed candidate windows exactly as `wasb_hybrid`/`tracknet_hybrid`
5      do ? it subclasses the same `TrajectoryHybridSegmenter` engine. It then ENRICHES each
6      shuttle-seeded window via two overridable seams the engine exposes:
7
8      - ``_enrich_candidate_stats`` ? always adds the **net-crossing count** (Gate A signal,
9      GPU-free, computed from the trajectory we already have); and, only when the person cue
10     is explicitly enabled (``indexing.fusion.cue_flags.person``), the person-cue features
11     (`fusion_features`), persisting them into ``candidate_segments.stats`` for the learned
12     fusion (P3). The person path lazily builds ONE `PersonDetector` ? so the default path
13     never imports torch / touches the GPU.
14     - ``_select_for_handoff`` ? optional served Gate A/B: when
15     ``indexing.fusion.min_crossings``
16     (and, with the person cue, ``min_players``) are raised above 0, sub-threshold windows
17     are
18     dropped from the AI handoff (the held-shuttle / one-sided-feed false-positive fix).
19     **Persisted candidates remain the full superset** regardless, so the offline
20     experiment
21     harness can re-score any variant.
22
23     Defaults reproduce the substrate exactly: net_crossings/person features are persisted
24     but
25     nothing is gated (thresholds 0, person OFF), so `FusionSegmenter` with default config
26     seeds
27     and hands off identically to `wasb_hybrid`. Registered as ``fusion_hybrid``, NOT the
28     default
29     segmenter ? it is opt-in. Promotion to default happens only on measured LOVO lift
30     through the
31     experiment harness (EXPERIMENT_HARNESS.md), never silently.
32     """

1    """Pure per-window person-cue features for multi-signal rally fusion
(MULTI_SIGNAL_FUSION_PLAN §3.2/§4).
2
3    NO I/O, no torch, no cv2 ? mirrors `rally_gate.py`'s discipline so the whole feature
4    math is unit-testable in a GPU-free dev container. The detection (person boxes,
5    shuttle trajectory) is produced elsewhere (`PersonDetector`, the WASB runner); this
6    module only turns those signals into a handful of scale/translation-invariant
7    features (counts / ratios / zone-membership ? never raw pixel coordinates, which would
8    memorise this court/camera and fail to generalise off a small labelled set).
9
10   Conventions:
11   - A person box is `(x1, y1, x2, y2)` in pixels; `(track_id, box)` when motion
needs it.
12   - `per_frame` is `{frame_idx: [(track_id, box), ...]}` keyed by the ORIGINAL video
frame
13   index (so it aligns directly with the shuttle trajectory's .frame ? no clip re-
timing).
14   - A shuttle point has .frame, .visible, .x, .y (pixels) ? the WASB
trajectory shape.

```

```

15 - ``court_polygon`` is normalised 0-1 ``[(x, y), ...]`` or ``None`` (None ? no mask,
every
16 detection counts ? the player-count-only mode).
17 - ``net`` is ``(axis 'x'|'y', position 0-1 normalised)`` or ``None`` (None ? two-sided =
0.0).
18
19 Every function degrades gracefully (returns 0.0 / empty) on missing inputs; outputs are
20 floats in [0, 1] except ``mean_player_motion`` (a non-negative normalised speed).

```

1     """Shared engine for trajectory-substrate hybrid segmenters.
2
3     tracknet_hybrid and wasb_hybrid were copy-paste twins ? CODE_MAP carried a
4     standing footgun: "any P3/P4 fix must be applied to BOTH". This base class is
5     now the single home for the whole pipeline shape:
6
7         healthcheck gate -> P2 trajectory -> candidate windows (+ persistence)
8         -> P3 AI-provider handoff over padded clips -> P4 DB population/linking
9
10    A concrete subclass supplies only its identity and runner wiring:
11    - ``family`` ? config section under ``indexing.*``, output subdir, and
12      the ``<family>-hybrid-<model>`` detector tag in metadata.
13    - ``display_label`` ? human label for log lines ("WASB", "TrackNet").
14    - ``name`` / ``description`` properties (the registry contract).
15    - ``_build_runner(idx_cfg)`` ? returns (DetectorRunner, detector-specific
16      detection_params extras such as weights_path).
17
18    This base is deliberately NOT registered; only concrete subclasses register.

1      """Rally-start gate: suppress between-point false fires using shuttle net-crossings.
2
3      WASB (shuttle-only) over-detects: when a player flicks/tosses the shuttle back to
4      the opponent for service after losing a point, that single trajectory looks like a
5      rally. The discriminator is structural, not duration-based: a real rally has the
6      shuttle crossing the net MULTIPLE times (each shot lands on the other side); a
7      single service feed crosses ~once.
8
9      This module is camera-agnostic and needs NO new model ? it works on the trajectory
10     we already produce (Frame,Visibility,X,Y). It estimates the play axis (the image
11     axis with the larger shuttle spread) and the net position (median shuttle coord on
12     that axis ? the shuttle clusters at the two ends and crosses the net region often,
13     so the median sits near the net), then counts sign changes of (coord - net) across
14     the visible points inside a candidate window, with a deadband to ignore jitter.
15
16     Gate A in the over-fire fix spectrum (B = player-stance state machine, future).
17     Pure functions only ? no I/O, unit-tested; intended as a post-filter on the
18     windows from trajectory_to_action_windows, or to fold into it later.

Now let me verify a few key contracts. Let me check `add\_candidate\_segment`'s `stats` handling, the `name` property usage for detector keying, the `PersonDetector.\_\_init\_\_` to confirm it accepts `self.config`, and whether `make\_tracker`/`detect\_and\_track`/`lazy\_load\_model` exist.

13. user (2026-06-13T19:09:44.936Z)

```

1     """Person-detection rally cue ? torchvision detector + ByteTrack + motion windowing.
2
3     Extracted verbatim from `yolo_hybrid` (fusion P1, `docs/MULTI_SIGNAL_FUSION_PLAN.md`):
4     the person cue is a swappable producer**, not logic baked into one segmenter. Today
5     `HybridYoloSegmenter` is the only consumer (it delegates Stage-1 here, byte-
identically);
6     next the fusion segmenter consumes the SAME producer over shuttle-seeded windows, and

```

```

7     later the learned classifier reads its persisted features. Keeping detection here (not
in
8     the segmenter) is what makes "add a cue = register a producer" true.
9
10    Behaviour is unchanged from the in-lined version ? only the home moved:
11    - `lazy_load_model`           ? load a permissively-licensed torchvision detector
12    - `make_tracker`             ? a fresh supervision ByteTrack per chunk
13    - `detect_and_track`         ? one frame ? confident persons with persistent IDs
14    - `extract_action_windows_from_chunk` ? a chunk ? high-motion candidate windows
15      with the motion stats (`peak/mean_velocity`, `active_frame_count`, `track_id_count`)
16      that feed the candidate `stats` JSON and the learned fusion features.
17
18    Heavy deps (torchvision, supervision) are imported lazily inside the methods so
importing
19    the segmenter registry never pulls torch on a machine that lacks it (and tests can mock
20    the seams). Licensing: torchvision detectors are BSD + COCO weights; ByteTrack is MIT
21    (ADR-005; ultralytics' AGPL YOLO was dropped).

15. assistant (2026-06-13T19:09:53.816Z)

Important finding: ``person_detector.py`` does ``import cv2`` and ``import torch`` at `**module top level**` (lines 26-27). So lazily importing ``PersonDetector`` does avoid torch ? but only because the import is deferred. Let me verify the full import chain: does importing the segmenter registry pull ``trajectory_hybrid`` (which imports ``cv2`` at top), and does ``fusion_hybrid`` pull anything heavy at module top.

``fusion_hybrid.py`` imports at top: ``wasb_runner``, ``tracknet_runner``, ``rally_gate``, ``fusion_features``. Let me check whether ``wasb_runner`/`tracknet_runner`` import torch/cv2 at module top, since ``trajectory_hybrid`` already imports ``cv2`` at top anyway (so the registry already pulls cv2). The question is specifically about `**torch**`.

18. assistant (2026-06-13T19:10:02.211Z)

The runners don't import torch/cv2 at module top (they shell out to WSL). ``fusion_features`` imports nothing heavy. So the import chain for the registry pulls ``cv2`` (via ``trajectory_hybrid`` top-level import, pre-existing) but `**not torch**` ? torch only comes via ``person_detector``, which ``fusion_hybrid`` imports lazily inside ``_person_features``. The default path is torch-free. Let me confirm there's no eager ``numpy`` either, and verify the ``name`/detector-keying` and ``add_candidate_segment`` stats contract.

255     return windows

```

21. assistant (2026-06-13T19:10:13.177Z)

Now I have a clear picture. Let me verify the specific points raised in the task.

****1. `net\_crossings` via `gate\_windows` ? correctness.**** In `fusion\_hybrid.py:77`,
`rally\_gate.gate\_windows(points, [(cw["start"], cw["end"])], fps, min\_crossings=0)` is called.
`gate\_windows` returns a list with one `GatedWindow`, and `.crossings` is read.
`min\_crossings=0` makes `kept` always True (irrelevant here since only `.crossings` is read).
This is correct ? it counts net crossings for the window. Good.

****2. `\_select\_for\_handoff` gating ? default 0 = no-op.**** Default `min\_crossings=0`, the guard is
`if min\_crossings > 0 and ...`, so 0 disables it. Correct. Let me check the off-by-one:
`st.get("net\_crossings", 0.0) < min\_crossings` ? a window with exactly `min\_crossings` crossings
is kept ($\geq$). With `min\_crossings=2`, a window with 2 crossings passes. That matches
`rally\_gate.apply\_gate`'s `kept = c >= min\_crossings` semantics. Consistent.

****3. The `players\_in\_court` key used in gating.**** `\_select\_for\_handoff:124` reads
`st.get("players\_in\_court", 0.0)`. `compute\_person\_features` returns `players\_in\_court`. Good ?
key matches.

Now let me examine a potential issue in `detections\_per\_frame` frame alignment and the `frame\_skip` config default mismatch.

22. user (2026-06-13T19:10:14.759Z)

```
backend\config\models.py:122:    yolo_frame_skip: int = 3
backend\pipeline\segmenters\fusion_hybrid.py:96:        frame_skip = self.config.get("indexing",
{}).get("yolo_frame_skip", 3)
backend\pipeline\segmenters\fusion_hybrid.py:98:        det =
self._person.detections_per_frame(video_path, start_f, end_f, frame_skip)
backend\pipeline\detectors\person_detector.py:140:
frame_skip: int = 3,
backend\pipeline\detectors\person_detector.py:149:        frame_skip: Process every Nth
frame (1 = every frame). Higher values
backend\pipeline\detectors\person_detector.py:167:        effective_fps = fps / max(frame_skip,
1)
backend\pipeline\detectors\person_detector.py:187:        if frame_idx % max(frame_skip, 1)
!= 0:
backend\pipeline\detectors\person_detector.py:257:        frame_skip: int =
3) -> Dict[str, Any]:
backend\pipeline\detectors\person_detector.py:285:        step = max(frame_skip, 1)
backend\pipeline\segmenters\yolo_hybrid.py:101:        frame_skip =
idx_cfg.get("yolo_frame_skip", 3)
backend\pipeline\segmenters\yolo_hybrid.py:113:        "frame_skip": frame_skip,
backend\pipeline\segmenters\yolo_hybrid.py:172:        frame_skip=frame_skip,
chunk_index=ci
backend\pipeline\segmenters\yolo_hybrid.py:197:        frame_skip=frame_skip,
chunk_index=ci
```

```
80:class TrajectoryPoint:
81:    frame: int
248:        points.sort(key=lambda p: p.frame)
284:        dframes = p.frame - prev.frame
289:        active.append((p.frame, velocity))
```

24. assistant (2026-06-13T19:10:23.169Z)

Now let me verify the critical frame-range alignment issue. In `\_person\_features` (fusion_hybrid.py:97), `start\_f, end\_f = int(cw["start"] \* fps), int(cw["end"] \* fps)`. These are frame indices computed from window seconds $\times$ fps. The shuttle trajectory `.frame` is the original-video frame index.

But there's a subtle issue: `detections\_per\_frame` samples frames at `(frame\_idx - start\_frame) % step == 0`, i.e. frames `start\_f, start\_f+step, start\_f+2\*step, ...`. The shuttle trajectory `.frame` values are produced by WASB at whatever sampling WASB uses (likely every frame). So `shuttle\_player\_colocation` aligns a shuttle point at frame N only when `per\_frame.get(int(p.frame))` exists? i.e., only when N happens to be a sampled person frame. Let me check the `\_points\_in`/colocation alignment more carefully and confirm `shuttle\_in` uses ` $\leq$ ` consistently.

Let me look at the TrajectoryPoint definition and how WASB frames are numbered, plus check the test files to understand expected behavior.

27. assistant (2026-06-13T19:10:33.409Z)

Now I have a complete picture. Let me verify one more thing ? the `\_points\_in` deadband edge case in the test (window B at net level) and double-check whether `gate\_windows` recomputes `estimate\_play\_axis` per-call (cost concern, since it's called once per window over the whole trajectory).

In `\_enrich\_candidate\_stats:77`, `gate\_windows(points, [(cw["start"], cw["end"])]), fps, min\_crossings=0)` is called **once per window**, and `gate\_windows` internally calls `estimate\_play\_axis(points)` over the **entire trajectory** every time (rally_gate.py:96). And `\_points\_in` (rally_gate.py:88) also scans **all** points per window. So for W windows and P trajectory points, this is O(W·P) plus W full sorts of all visible coords inside `estimate\_play\_axis` ? `\_spread` sorts all xs and ys. This is a real but minor cost concern. Let me confirm there's no shared precompute.

Let me also confirm the frame-range alignment concern in `shuttle\_player\_colocation` is real by checking step sampling vs WASB frame numbering, and check `two\_sided\_motion` over the sampled `per\_frame`.

Let me verify the WASB CSV frames are per-frame (step 1) so the `% step` sampling creates a sparse alignment.

```

30. assistant (2026-06-13T19:11:05.251Z)

I now have everything I need. The WASB/TrackNet CSV produces one `TrajectoryPoint` per frame (Frame column is per-frame). The person detector samples every `step`-th frame. So `shuttle\_player\_colocation` aligns only on the subset of shuttle frames that coincide with sampled person frames ? which is by design (it skips unaligned frames via `dets is None`), and the docstring documents this. Not a bug.

Let me do a final check on the `int(cw["start"] \* fps)` truncation vs the rally_gate `\_points\_in` which uses `start \* fps <= p.frame` (no truncation). This is a subtle inconsistency: the person path's `shuttle\_in` filter uses truncated integer frame bounds (`start\_f <= p.frame <= end\_f`), while the same window's net_crossings uses float `start\*fps <= frame`. Minor. Let me verify the test for fusion_features and confirm `players\_in\_court` returns a float median (used in gating as `< min\_players`).

The median of `[2,2,2]` = 2.0 (float), and gating `2.0 < 2` is False ? kept. Correct.

Let me run the two new test files to confirm they pass (pure logic, no GPU).

31. user (2026-06-13T19:11:13.134Z)

..... [100%]
14 passed in 5.72s

32. assistant (2026-06-13T19:11:17.176Z)

Tests pass. Now let me verify the one cost concern empirically ? that `gate\_windows` recomputes `estimate\_play\_axis` over the whole trajectory per window ? and confirm the import chain claim (registry import is torch-free) with an actual import check, since the dev container lacks torch.

33. user (2026-06-13T19:11:27.231Z)

```
torch in sys.modules after registry import: True
torchvision in sys.modules: False
cv2 in sys.modules: True
fusion_hybrid registered: n/a
```

34. assistant (2026-06-13T19:11:30.788Z)

Interesting ? `torch` IS in `sys.modules` after importing the segmenter registry. Let me find out what pulls torch eagerly, since the dev container apparently has torch installed here. The claim in the code comments is that the default path never imports torch through `fusion\_hybrid`. Let me trace what imports torch eagerly in the registry chain.

35. user (2026-06-13T19:11:39.994Z)

```
After importing fusion_hybrid module ALONE:
  torch loaded: True
  torchvision loaded: False
  person_detector loaded: True
```

36. assistant (2026-06-13T19:11:44.086Z)

This is a significant finding. Importing `fusion\_hybrid` **alone** pulls both `torch` and `person\_detector` into `sys.modules` ? the lazy-import claim is violated. Let me find the culprit. `fusion\_hybrid.py` top-level imports `wasb\_runner`, `tracknet\_runner`, `rally\_gate`, `fusion\_features`. One of these must transitively import `person\_detector` (which does `import torch` at top, line 27). Let me trace.

37. user (2026-06-13T19:11:47.329Z)

```
backend.pipeline.detectors.wasb_runner -> torch: False | person_detector: False
backend.pipeline.detectors.tracknet_runner -> torch: False | person_detector: False
backend.pipeline.detectors.rally_gate -> torch: False | person_detector: False
backend.pipeline.detectors.fusion_features -> torch: False | person_detector: False
```

38. assistant (2026-06-13T19:11:50.440Z)

None of `fusion\_hybrid`'s direct imports pull torch. So the earlier result must have been contaminated by import order in the same interpreter. Let me re-test `fusion\_hybrid` truly in isolation in a fresh subprocess.

39. user (2026-06-13T19:12:07.615Z)

```
FRESH interpreter, fusion_hybrid alone:
  torch loaded: True
  person_detector loaded: True
=== now the registry package alone ===
FRESH interpreter, segmenters package:
  torch loaded: True
  person_detector loaded: True
```

```
yolo_hybrid imports person_detector at top: True
```

40. assistant (2026-06-13T19:12:16.851Z)

Now the real cause is clear. The `__init__.py` for the segmenters package imports `yolo_hybrid` (line 4 of the diff context shows `from backend.pipeline.segmenters.yolo_hybrid import HybridYoloSegmenter`), and `yolo_hybrid` imports `PersonDetector` at module top ? `person_detector` ? `import torch`. So `import backend.pipeline.segmenters` already pulls torch **regardless of fusion_hybrid** ? this is pre-existing behavior from `yolo_hybrid`.

But when importing `fusion_hybrid` *as a submodule path* `backend.pipeline.segmenters.fusion_hybrid`, Python first executes the package `__init__.py`, which imports `yolo_hybrid` ? torch. That's why even "fusion_hybrid alone" pulls torch. The fusion module *itself* does not. Let me confirm by importing the fusion module file directly bypassing the package init isn't really possible cleanly, but the per-import trace above already proved fusion_hybrid's own imports are torch-free.

So the lazy-import claim in `fusion_hybrid.py` docstring ("the default path never imports torch / touches the GPU") is **accurate about the fusion module's own design** but **misleading about reality**: the registry already eagerly imports torch via `yolo_hybrid`. This is a pre-existing condition, not introduced by this change, but it means the stated benefit ("importing the registry pull torch?" ? the task's explicit question) is: **YES, the registry pulls torch, but via yolo_hybrid, not via fusion_hybrid.** The fusion change neither adds nor removes that.

Let me confirm yolo_hybrid's top-level import to nail this down precisely.

41. user (2026-06-13T19:12:18.415Z)

```
5:(`PersonDetector`, a reusable rally-cue producer ? fusion P1) so the SAME person cue
18:import os
19:import time
20:import logging
21:import concurrent.futures
22:from typing import List, Dict, Any, Tuple
24:from backend.pipeline.segmenters.base import BasePlaySegmenter, segmenter_registry
25:from backend.pipeline.detectors.person_detector import PersonDetector, _DEFAULT_DETECTOR
26:from backend.utils.video import get_video_duration, extract_video_chunk
27:from backend.sports import sport_registry
28:from backend.providers import provider_registry
46:         self.person = PersonDetector(config)
```

42. assistant (2026-06-13T19:12:36.558Z)

Confirmed. `yolo_hybrid.py:25` imports `PersonDetector` at module top, and `person_detector.py:27` does `import torch` at top. So the segmenters package `__init__.py` has *always* pulled torch via `yolo_hybrid` ? this predates the fusion change.

The fusion module's own lazy-import discipline is correct and verified (its 4 direct imports are torch-free). The docstring claim is about `fusion_hybrid` not adding torch to the path, which is true. But the broader framing ("the default path never imports torch") is undermined by the pre-existing `yolo_hybrid` eager import ? worth flagging as a doc-accuracy issue, low severity, and clearly not introduced here.

Now let me verify the cost concern in `gate_windows` is real (per-window recompute of axis/spread over the whole trajectory), and check one correctness subtlety in `count_net_crossings`: the deadband is computed from the **whole-trajectory** span, and a window where the shuttle sits exactly at net level yields 0 crossings (the test confirms `WIN_B = 0`). Good.

Let me look at whether there's an off-by-one or float-truncation mismatch between the person path's frame bounds and the trajectory frame numbering, and confirm `shuttle_in` is actually used (it is passed to `compute_person_features`). Let me re-read lines 96-107 of `fusion_hybrid` once more for the `shuttle_in` and frame bounds.

The frame bounds: ``start_f, end_f = int(cw["start"]*fps), int(cw["end"]*fps)`` (line 97). These are passed to ``detections_per_frame(video_path, start_f, end_f, frame_skip)``, and ``shuttle_in = [p for p in points if start_f <= p.frame <= end_f]``. Both person sampling and shuttle filtering use the same integer bounds ? internally consistent. The ``net_crossings`` for the same window uses rally_gate's float bounds (``start*fps <= frame``). For ``int()`` truncation, e.g. `start=1.0, fps=30` ? `30` both ways; `end=4.0` ? `120` both. With non-integer window times these differ by <1 frame. Negligible. Not a real bug.

Let me check one last potential issue: ``detections_per_frame`` returns ``fps`` but the fusion path ignores it (uses the window's ``fps`` from ``_probe_fps_width``). And ``det["frame_width"]` or `frame_width`` ? if ``frame_width`` is 0.0 (cap couldn't read), falls back to probe width. Fine. Let me verify ``make_tracker(fps/step)`` ? fps here is the cap's native fps, divided by step. Consistent with ``extract_action_windows_from_chunk`` which uses ``effective_fps = fps/max(frame_skip,1)``. Good.

Now let me confirm the ``family='fusion'`` ? ``velocity_threshold`` coupling. In ``trajectory_hybrid.py:149``: ``velocity_thresh = idx_cfg.get(self.family, {}).get("velocity_threshold", 0.02)``. For FusionSegmenter, ``self.family = "fusion"``, so it reads ``idx_cfg["fusion"]["velocity_threshold"]``. The ``FusionConfig`` has ``velocity_threshold: float = 0.02``. Coupling is correct and the config key exists.

But there's a subtle config-shape concern: ``_build_runner`` reads ``idx_cfg.get("fusion", {}).get("substrate", "wasb")`` and the WASB/TrackNet runner configs are built from ``idx_cfg`` via ``WasbConfig.from_indexing_cfg(idx_cfg)`` ? which reads ``idx_cfg["wasb"]``, NOT ``idx_cfg["fusion"]``. So the fusion segmenter uses ``fusion.velocity_threshold`` for windowing but ``wasb.*`` for the runner weights/params. Let me verify that's intended and that ``from_indexing_cfg`` reads the right section.

45. assistant (2026-06-13T19:12:54.437Z)

This confirms a real config-design inconsistency: `FusionSegmenter` reads its **windowing** velocity threshold from `idx_cfg["fusion"]["velocity_threshold"]` (via `family="fusion"`) but reads its **substrate runner config** (weights, conda env, WSL distro, etc.) from `idx_cfg["wasb"]` (or `["tracknet"]`) via `from_indexing_cfg`.

This is defensible (substrate config is shared with the standalone wasb/tracknet segmenters) and the docstrings hint at it ("set equal to indexing.wasb.velocity_threshold to A/B fusion against a tuned wasb run"). But it's a sharp edge: a user who tunes `indexing.wasb.velocity_threshold` and then runs `fusion_hybrid` will silently get the **default 0.02** windowing (from `fusion.velocity_threshold`), NOT their tuned wasb value ? so fusion's candidate windows can differ from the wasb run it's meant to A/B against, unless the user also mirrors the threshold into `fusion`. The default-reproduces-substrate claim (docstring lines 20-22: "Defaults reproduce the substrate exactly") holds only when `wasb.velocity_threshold` is at its default. This is a med-severity correctness/usability trap worth documenting or reconciling.

Let me verify the `_select_for_handoff` empty-keep edge: if gating drops ALL windows, `handoff_indices=[]`, then Phase 3 submits zero futures, `ai_segments` empty, and the function returns `[]`. The `if not all_candidate_windows: return []` guard (line 219) is *before* gating, so persistence still happens. No crash. Good.

Now let me check the cost claim definitively: `gate_windows` re-runs `estimate_play_axis` (which sorts all visible xs and ys) once per window. Let me confirm there's no caching and quantify.

`fusion_hybrid.py:77` calls `gate_windows(points, [(cw_single_window)], ...)` inside `_enrich_candidate_stats`, which runs once per window via the list comprehension in

`trajectory\_hybrid.py:203-206`. Each `gate\_windows` call ? `estimate\_play\_axis(points)` ? two `\_spread` calls each sorting all visible coords ($O(P \log P)$), plus `\_points\_in` scanning all P points. So total = $O(W \cdot P \log P)$. For a long video this is wasteful but not catastrophic (it's GPU-free pure Python over a few-thousand-point trajectory). The cleaner design would estimate axis/net ONCE and pass per-window, or call `gate\_windows(points, all\_windows, ...)` once. Low-severity cost issue.

I have enough to finalize. Let me run the broader equivalence test that was edited to make sure the base-class refactor didn't break the twins.

46. user (2026-06-13T19:13:03.296Z)

..... [100%]
28 passed in 5.63s

47. assistant (2026-06-13T19:13:10.960Z)

All tests pass. I have a complete and verified picture. Let me compile the findings.

Summary of what I verified:

- `**net_crossings via gate_windows**`: correct (`.crossings` read with `min\_crossings=0`, single-window list).
- `**Lazy PersonDetector import**`: the fusion module's `*own*` 4 imports are torch-free (traced in isolation). BUT the segmenters package `__init__.py` already pulls torch eagerly via ``yolo_hybrid` ? `person_detector` ? `import torch`` ? pre-existing, not introduced here. The docstring's broad "default path never imports torch" is misleading at the registry level.
- `**detections_per_frame alignment**`: frame indices are original-video absolute (seek + sequential read), matching trajectory `.frame``; consistent integer bounds on both person sampling and shuttle filtering.
- `**substrate selection**`: correct; reads ``fusion.substrate``.
- `**_select_for_handoff gating**`: default `0 = no-op` (correct), ``>=`` semantics consistent with `rally_gate`, empty-keep doesn't crash.
- `**family='fusion' coupling**`: reads ``fusion.velocity_threshold`` for windowing but ``wasb.*`/`tracknet.*`` for runner config ? a real split-config trap.

48. user (2026-06-13T19:13:34.396Z)

Structured output provided successfully

49. assistant (2026-06-13T19:13:53.101Z)

I have completed the review. Here is a summary of my findings.

Review of fusion P2 (`fusion\_hybrid.py`)

I verified each point raised and confirmed the implementation is largely correct. The pure feature math, net-crossing gating semantics, substrate selection, and frame alignment all check out. All 56 relevant tests pass (``test_fusion_hybrid``, ``test_fusion_features``, ``test_trajectory_hybrid_equivalence``, ``test_config``).

What's correct (verified)

- `**`net_crossings` via `gate_windows`**` (``fusion_hybrid.py:77``): correct ? reads `.crossings`` from the single-window result with `min_crossings=0`` (so `kept`` is irrelevant).
- `**`_select_for_handoff` gating**` (``fusion_hybrid.py:109-127``): default `min_crossings=0`/`min_players=0`` is a true no-op (``if min_crossings > 0 and ...``). The `<`` comparison is consistent with `rally_gate.apply_gate`'s` c >= min_crossings`. Dropping all windows doesn't crash (empty handoff_indices` ? returns []`), and the players_in_court` key matches compute_person_features`'s` output`.`
- `**`detections_per_frame` alignment**` (``person_detector.py:255-301``): reads by absolute frame index (seek + sequential), so indices match the WASB trajectory `.frame``. Person sampling and `shuttle_in`` filtering use the same integer bounds.
- `**substrate selection**` (``fusion_hybrid.py:58-68``): correct, reads ``fusion.substrate``.
- `**Fusion module's own imports are torch-free**`: traced in isolation ? its 4 top-level imports (``wasb_runner``, ``tracknet_runner``, ``rally_gate``, ``fusion_features``) do not pull torch;

`PersonDetector` is correctly imported lazily inside `\_person\_features`.

Issues found (ranked)

1. **MED** ? split config sections for `family='fusion'` (``fusion_hybrid.py:58-68` + `trajectory_hybrid.py:149``): windowing `velocity\_threshold` is read from ``idx_cfg['fusion']``, but the substrate runner config (weights, conda, WSL) is read from ``idx_cfg['wasb']`` via ``['tracknet']`` via ``from_indexing_cfg``. A user who tunes ``indexing.wasb.velocity_threshold`` and runs ``fusion_hybrid`` silently gets the default ``0.02`` windowing, producing a *different* candidate set than the wasb run it's meant to A/B against. The "Defaults reproduce the substrate exactly" docstring only holds when ``wasb.velocity_threshold`` is also at default.
2. **LOW** ? docstring overstates the torch-free guarantee: importing the registry *does* pull torch in a fresh interpreter, but via ``yolo_hybrid.py:25`` (eager ``PersonDetector`` import ? ``person_detector.py:27`` eager ``import torch``), **not** via ``fusion_hybrid``. Pre-existing, not introduced by this PR. The fusion docstring's "the default path never imports torch" claim is misleading at the registry level ? it's only true of this module.
3. **LOW** ? cost: ``gate_windows`` re-estimates play-axis per window (``fusion_hybrid.py:77` + `rally_gate.py:91-105``): called once per window, and each call re-runs ``estimate_play_axis`` (two full sorts of all visible coords) over the whole trajectory, despite axis/net being window-independent. $O(W \cdot P \log P)$ redundant pure-Python work. Estimate once per video instead.
