## Transcript

### 1. user (2026-06-19T16:59:09.585Z)

You are an adversarial design reviewer. Be skeptical; the goal is to find real flaws BEFORE we build.

CONTEXT ? badminton/racket-sports rally detector. Pipeline: WASB shuttle DETECTOR (heatmap ? per-frame candidate list) ? single-target online TRACKER (collapses to ONE (x,y) per frame) ? velocity windower ? rallies.

MEASURED (GX010142, owner's anchor clip, on the 21-25s window, from the cached det\_raw.jsonl detector candidates):

- WASB's detector emits  $\geq 2$  candidates on 31% of detected frames (cached, never used past the tracker).
- During the 21-25s rally: 93% of frames carry the ADJACENT-court shuttle (x-norm  $\sim 0.88$ , what the tracker followed),
  - 83% ALSO carry a PROMINENT-court shuttle (x-norm  $\sim 0.56$ ), 76% carry BOTH at once.
- A greedy nearest-neighbour reconstruction of the prominent-court candidates yields a CONTINUOUS rally arc
  - (75% window coverage, 431px vertical excursion, 8.6px median per-frame jump,  $\sim 2.4$ s sustained)

? VISUALLY CONFIRMED

as a real foreground-court rally (player mid-stroke ? net ? second player), which the single-target tracker discarded.

PROPOSED DESIGN ("the Which problem"):

Split the tracker's two conflated jobs:

- Layer 1 "see everything": a MULTI-TARGET linker over the ALREADY-CACHED det\_raw.jsonl candidates ? a SET of shuttle
  - tracks per region (top-K), each with trajectory + duration + motion-energy. Pure-Python over the cache, ZERO GPU,
  - WASB stays frozen (MIT).
- Layer 2 "pick the match's story": score each track by court-membership (the existing prominent-court polygon +
  - point\_in\_polygon) + rally-likeness (motion energy, vertical excursion,  $\geq 2$  net-crossings/Gate-A, ends on shuttle-floor-contact) and SELECT the track(s) whose story is the match's; feed those to the windower.

Claimed benefits: recall-POSITIVE (recovers the discarded prominent rally ? a G1 miss) AND precision-positive (drops the adjacent rally) ? unlike today's court\_gate which is a subtractive post-filter on the single track (precision-only). Also claimed to SUBSUME the "ghost" (a stuck-pixel false-lock track has  $\sim 0$  motion energy ? never selected). Lands default-OFF, flag-gated, measured on cached candidates + golden labels with no GPU; single-track tracker stays the default.

YOUR LENS:

Attack the EVAL METHODOLOGY + n=1 OVERFITTING. The whole design is validated on ONE clip/ONE window (GX010142 21-25s). How do we measure ?P/?R/?F1 HONESTLY on cached candidates + golden labels with no GPU, on the dual eval sets (raw + golden), with an over-seg guard, WITHOUT designing the selection heuristics to fit GX010142? What is the minimum corpus/protocol before any default-ON flip? Mitigations + a concrete measurement protocol.

Return concrete, technically-grounded risks with severity + mitigations. Mark kills\_design=true ONLY for a fundamental unmitigable flaw.

## 2. assistant (2026-06-19T16:59:13.402Z)

I'll investigate the actual cached data and code to ground this adversarial review in reality rather than just reasoning abstractly. Let me start by pulling the repo and reading the key docs.

## 3. user (2026-06-19T16:59:16.900Z)

Your configuration specifies to merge with the ref 'refs/heads/docs/court-floor-rally-end' from the remote, but no such ref was fetched.

## 5. assistant (2026-06-19T16:59:20.543Z)

The remote ref isn't fetchable (likely a local-only branch), so I'll proceed read-only on what's local. Let me read the key design docs and find the actual cached candidate data.

## 6. user (2026-06-19T16:59:21.450Z)

```
1      # Prominent-Court Detection ? kill background-court false positives (multicourt)
2
3      > **Status:** `DRAFT` ? design + experiment **owner-gated for any default flip** .
**Owner:** Avi . **Created:** 2026-06-19 . **Last updated:** 2026-06-19
4      > **Lifecycle:** `DRAFT` ? IN PROGRESS ? DONE ? archived` (move to `docs/archives/` when
DONE)
5      > **Tracking anchors:** §8 progress tracker is the source of truth; pointer in memory
`current-state`.
6      > **Relation to existing docs:** attacks gap **G2** ("precision ? local over-fires,
worst on multicourt") from [`RALLY_DETECTION_GAP_CLOSURE.md`](RALLY_DETECTION_GAP_CLOSURE.md);
it is the **shuttle-side** counterpart of the person-side **Gate B / court mask** in
[`MULTI_SIGNAL_FUSION_PLAN.md`](MULTI_SIGNAL_FUSION_PLAN.md). Complements the held-shuttle
**`shuttle_player_colocation`** (G3) ? court-localization (G2) and held-shuttle (G3) are
independent precision levers.
7      > **Honesty note:** claims are tagged `[verified]` (checked vs code/measured) /
`[design]` (proposed). Every signal lands **flag-gated, default-OFF**, promoted only on measured
lift per [`EXPERIMENT_HARNESS.md`](EXPERIMENT_HARNESS.md) + [[decision-rigor-norm]].
8
9      ---
10
11     ## 0. TL;DR
12     In **multicourt** footage the camera sees several courts. The shuttle detector (WASB)
tracks *any* shuttle in frame, so a rally on a **background / adjacent court** becomes a
predicted rally on the **main match** ? a false positive. The fix: identify the **prominent
court** (the foreground court that occupies the majority of the frame, where the match being
filmed is played) and **keep only rallies whose shuttle lives inside it**. Mechanically this re-
defines the shuttle signal from `(x, y, visible)` to `(x, y, visible-AND-inside-the-prominent-
court)` *before* windowing ? so a background-court shuttle reads as "not there" and never forms
a rally. A flat 2D floor polygon is the MVP; a **pseudo-3D play-volume** (court floor + the air
column above it) is the refinement so a high clear over the prominent court isn't wrongly
rejected. Lands as a **default-OFF experiment** ; the flip is gated on a Launch Report ([[launch-
report-convention]]).
13
14     ## 1. Problem & motivating example `[verified]`
15     - **Measured gap (G2):** local over-fires ~2x vs Gemini, and the over-fire is **worst on
multicourt** ? even among long (>7s) rallies, multicourt over-fires **1.58x** (background-court
games are *real* long rallies, just on the wrong court). See `RALLY_DETECTION_GAP_CLOSURE.md` §3
+ the P7 long-rally lens.
16     - **Concrete anchor ? GX010142 rally #1 (2026-06-19).** Owner observation: "the first
```

```

rally is just a shuttle flying in the non-prominent court? while the prominent-court players
have not started." Confirmed from the cached WASB trajectory
(`output/wasb/GX010142_1080p__*.wasb.csv`): rally #1 (`0.72?3.65s`, 2.94s) has a shuttle
centroid at meanX ? 1616 on a 1920-wide frame (?84% to the right) ? spatially apart from the
central cluster where most rallies live (meanX ? 1000?1300). Several other suspicious rallies
(#3, #9, #12, #16) cluster in the same far-right band ? consistent with a right-side adjacent
court.
17 - Why a 1D threshold is not enough `[verified]`: the courts do not separate cleanly
on X or Y alone (rally Y-centroids overlap 250?620 px across courts; the far-right band mixes
with foreground play). The courts are 2D regions under perspective ? so we need the court
geometry, not a coordinate cutoff. This is the owner's "pseudo-3D / court model" intuition,
validated by the data.
18
19 ## 2. Goal & non-goals
20 - Goal: on multicourt clips, drop rallies whose shuttle is outside the prominent
court, without losing real prominent-court rallies ? measured per-video, no regression on
single-court clips (where it must be a no-op or a do-no-harm).
21 - Non-goals (v1): multi-camera; tracking players across courts; full court-line
homography for scoring; anything biometric. Single-court footage is explicitly a no-op (one
court ? everything is "prominent").
22
23 ## 3. Decisions locked
24 | # | Decision | Rationale |
25 |---|-----|-----|
26 | D1 | The prominent court is a 2D region (polygon) in image space, refined to a
pseudo-3D play volume | 1D thresholds don't separate courts under perspective (§1) |
27 | D2 | Gate the shuttle trajectory by the region before windowing (re-define
visibility) | Stops a background rally at the source ? no window ever forms there. Reuses
`point_in_polygon` |
28 | D3 | Default-OFF, flag-gated; single-court = no-op | Zero-regression rollout
([[weak-signals-retained]]); no behaviour change unless a polygon is supplied + the flag set |
29 | D4 | Reuse the existing `court_polygon` config + `point_in_polygon`; do NOT invent
a new geometry stack | `FusionConfig.court_polygon` + `fusion_features.point_in_polygon` already
exist `[verified]` |
30 | D5 | The prominent court can be supplied (config) OR auto-derived; auto-derivation
is its own measured step | Config polygon is the cheapest first experiment; auto is the product
path |
31
32 ## 4. Design
33
34 ### 4.1 The signal change (the core experiment)
35 Today the windower consumes the raw WASB trajectory: a per-frame `(Frame, Visibility, X,
Y)`. The change is a pre-windowing filter:
36
37 ...
38 for each frame f: if shuttle_visible(f) and NOT inside_prominent_court(X_f, Y_f): mark
f as NOT visible
39 ...
40
41 A background-court shuttle is then indistinguishable from "no shuttle" ? the velocity
windower never opens a rally there. This is purely subtractive on the shuttle stream (it can
only remove visibility, never add it), so on a correctly-drawn prominent court it cannot
manufacture rallies ? only suppress out-of-court ones. (Mirror of `rally_gate`'s "do-no-harm"
discipline.)
42
43 ### 4.2 Identifying the prominent court (four routes, cheapest first)
44 1. Configured polygon (MVP, `[design]?buildable now`): a normalized `[x,y,?]`
court polygon per camera/clip, exactly the existing `FusionConfig.court_polygon`. Draw it once
from the dense shuttle/player cluster. Good enough to validate the whole concept on GX010142 +
the multicourt golden clips.
45 2. Player-location auto-derivation (`[design]`): run
`PersonDetector.detections_per_frame` `[verified]` exists, take the largest, most-central,
most-persistent player cluster (the foreground players are bigger boxes lower in frame), and
fit the prominent-court polygon to where those players' feet live. "Prominent = where the
match's players are." This is why the owner asked to extract person features ? players

```

anchor the court.

```
46      3. **Shuttle-density auto-derivation** (`[design]`): the prominent court is the densest
sustained shuttle-activity region; cluster the visible trajectory and take the dominant mode.
Person-free fallback.
47      4. **Court-line detection** (`[design]`, heaviest): Hough/segmentation court lines ? the
largest court quad. Most accurate, most work; deferred.
48
49      v1 ships route 1 (config) + measures; route 2 (player-anchored) is the product upgrade.
50
51      ### 4.3 Pseudo-3D play volume (the refinement)
52      A flat floor polygon rejects a shuttle at the top of a high clear *over the prominent
court* (it projects above the floor quad). The pseudo-3D model treats the prominent court as a
**floor quad + a vertical air column**: accept a shuttle if its image point lies within the
floor polygon **expanded upward** by a height envelope (the max plausible shuttle height
projected through the camera). Practically: the floor quad plus an upward `pad` (perspective-
aware ? larger near the net/far baseline). Start with a generous fixed upward pad (cheap, MVP);
upgrade to a per-camera height envelope only if measurement shows real rallies being clipped.
This keeps the floor tight (rejects adjacent-court floor play) while not clipping legitimate
high shuttles.
53
54      ### 4.4 Reuse map `[verified]`
55      | Need | Existing code |
56      |---|---|
57      | point-in-region test |
`backend/pipeline/detectors/fusion_features.py::point_in_polygon` |
58      | normalized court polygon config |
`backend/config/models.py::FusionConfig.court_polygon` (today: person/Gate-B only) |
59      | player boxes per frame |
`backend/pipeline/detectors/person_detector.py::PersonDetector.detections_per_frame` |
60      | trajectory parse + windowing |
`backend/pipeline/detectors/tracknet_runner.parse_trajectory_csv`, `backend/eval/windowing.py` |
61      | per-video scoring | `backend/eval/rally_seg_eval.py` (+ the `--stratify` multicourt
split, #220) |
62
63      New code is small: a `prominent_court_gate(points, polygon, height_pad)` that filters
trajectory points, threaded into the windowing input behind a default-OFF flag.
64
65      ### 4.5 Extension ? deterministic rally-END via shuttle-floor contact (owner note,
2026-06-19) `[design]`
66      The same court geometry that localizes the prominent court also unlocks a
**deterministic rally-END signal** ? the cheapest, most certain way to know a point is over:
**the shuttle hit the floor.** This attacks **G3** (rally-END over-extension), where today's
shuttle-velocity windowing runs the window long because "shuttle still moving ? rally over."
67
68      - **Introduce two geometric primitives:**
69      - **The white court lines.** A badminton court is bounded by **white, straight lines
forming a rectangle** (with the perspective trapezoid in image space). Detect them ? Hough lines
/ line-segment detection filtered to white, long, court-consistent segments ? to recover the
**court quad** (which also *is* the prominent-court floor polygon of §4.2 route 4; one detector
serves both).
70      - **The floor plane.** The court lines define the **floor** (the plane the players
stand on). The shuttle in flight lives *above* this plane; a shuttle *at* the plane (within the
trapezoid, or just outside it) is **on the floor**.
71      - **The rally-END rule (deterministic):** a rally ends when the shuttle makes **floor
contact** ? its trajectory descends to and **stops/rests at the floor level** (a near-zero-
velocity terminus at the court-line plane), OR a shuttle that goes to the floor **outside the
prominent court** = an out-of-bounds landing (also point-over). Unlike velocity heuristics, a
shuttle resting on the floor is **unambiguous** ? the point is over.
72      - **Why it's strong + cheap:** no new model, no person stack ? it reuses the WASB
trajectory (which already gives the shuttle's descending `(x, y)` + the `Visibility` drop when
it settles) plus the court-line geometry. It is the **shuttle-side** rally-END signal,
complementary to the **player-state** rally-END (player kinematics / held-shuttle) in
`RALLY_DETECTION_GAP_CLOSURE.md` §4 Lever A ? fuse both for robustness (a shuttle can settle
off-camera; a player can pick up early).
73      - **Subtlety to measure:** distinguish a true floor landing (point over) from a shuttle
```

that **\*\*dips low but is played back up\*\*** (a tight net shot / low retrieve). The court-line plane + a brief **\*\*dwell\*\*** at floor level (the shuttle rests, doesn't re-accelerate up) is the discriminator; tune the dwell window on golden clips.

74

75 This is tracked as **\*\*C8\*\*** below and cross-links gap-closure **\*\*G3\*\***. It shares the court-line detector with the prominent-court polygon (§4.2 route 4), so the two land together once court-line detection exists.

76

77 **## 5. Experiment plan (measurement)**

78 Land the gate flag-gated, then measure on the **\*\*cached trajectories\*\*** (CPU, no GPU/re-detect):

79 1. **\*\*GX010142 sanity:\*\*** draw a prominent-court polygon; confirm **\*\*rally #1 disappears\*\*** and the central rallies survive. The litmus the whole idea is born from.

80 2. **\*\*Multicourt golden\*\*** (`mahadevpura\_2, GX010128, Badminton\_BXH\_2, Boxhill\_Doubles`): ? rally-count, and once those clips are golden-labelled, ? precision / ? recall vs golden via `rally\_seg\_eval --stratify` (single vs multicourt). The win condition: multicourt precision up, **\*\*recall flat\*\*** (we drop FPs, not real rallies).

81 3. **\*\*Single-court no-op:\*\*** on single-court clips with no polygon (or a full-frame polygon) the gate is a verified no-op ? assert zero change.

82 4. **\*\*Dual-eval discipline\*\*** ([[eval-dual-set-regression]]): no per-video regression on either eval set.

83

84 Promotion to default-ON is a **\*\*separate, owner-gated\*\*** decision with a Launch Report (both rulers + the over-seg guard), never bundled with the experiment PR.

85

86 **## 6. Risks & limits**

87 - **\*\*Polygon is camera-dependent.\*\*** A hand-drawn polygon doesn't generalize across setups ? route 2/3 (auto-derivation) is the real product path; v1 config-polygon is for **\*validation\***.

88 - **\*\*Shuttle height\*\*** (§4.3): too-tight a floor clips high clears; the pseudo-3D pad mitigates, measurement tunes it.

89 - **\*\*The prominent court can change\*\*** (camera re-aim mid-clip): out of scope v1 (assume static per clip).

90 - **\*\*Not a recall fix.\*\*** This only removes out-of-court FPs; it does nothing for missed in-court rallies (G1) ? and must be proven not to **\*cost\*** recall.

91

92 **## 7. Open questions (owner / data)**

93 1. Auto-derivation anchor: **\*\*player-location\*\*** (route 2) vs **\*\*shuttle-density\*\*** (route 3) as the default once validated? \*(decides: data, post-experiment)\*

94 2. Height-envelope: fixed upward pad vs per-camera perspective model ? is the fixed pad enough? \*(decides: measurement)\*

95 3. Do we expose the prominent court as a **\*\*one-time per-camera setup\*\*** (draw-once UI) or always auto? \*(decides: owner/product)\*

96

97 **## 8. Deliverables & progress tracker ? source of truth**

98 Legend: ? Todo · ? In progress · ? Done · ? Gated. One small PR per row, off `origin/master`, no stacking.

99

| C8 | <b>**Court-line / floor detection**</b> ? (a) auto court polygon, (b) <b>**deterministic shuttle-floor-contact rally-END**</b> (§4.5, targets G3) | ?   ? owner          | ?   ?            |        |    |

111

```

112     ## 9. Definition of done
113     - [ ] The gate exists, is default-OFF, unit-tested, and a verified no-op on single-
court / no-polygon.
114     - [ ] GX010142 rally #1 (and the far-right adjacent-court band) is dropped while the
central rallies survive `[measured]`.
115     - [ ] On the multicourt golden clips, multicourt precision improves with recall flat
vs golden labels (no per-video regression).
116     - [ ] A winning configuration is flipped default-ON only via a Launch Report ? flip
`Status ? DONE`, archive.
117

123
124     ### Changelog
125     - 2026-06-19 ? Created from the owner's GX010142 rally-#1 (background-court FP)
observation + the measured multicourt over-fire (G2). Validated the 2D/pseudo-3D need from the
cached trajectory; mapped the reuse onto the existing `court_polygon` + `point_in_polygon`
machinery.
126     - 2026-06-19 ? Added §4.5 (owner note): a deterministic rally-END signal via shuttle-
floor contact ? detect the white court lines ? the floor plane ? a shuttle resting on the
floor (or landing out-of-court) ends the rally (targets G3). Shares the court-line detector with
the prominent-court polygon; tracked as C8.
127

## 7. user (2026-06-19T16:59:21.714Z)

```

1     # Ablation layer (Phase 0) ? per-signal marginal contribution
2
3     A systematic, repeatable version of the earlier one-off ablation:
4     `backend/eval/ablation.py` runs it and it EXCLUDES one signal, measures whether quality
dropped,
5     and reports each signal's marginal ?F1 (full set vs full-minus-that-signal) with a
bootstrap
6     95% CI + paired sign test + the C4 over-segmentation ratio. The broader design (the
ledger time
7     series, interaction handling, per-user ablation, the phased plan) is not yet split into
its own
8     doc; this note covers only the shipped Phase-0 runner.
9
10    ## What it is (and is not)
11
12    A pure driver. No new scoring/stats math ? every number defers to the shipped
13    `experiment.compare` + `eval_stats` engine, exactly as `compare` was a driver over
14    `metrics`/`calibration`. For a signal `s`:
15
16    ```
17    ?(s) = score(full set S) ? score(S \ {s})          # leave-one-out drop, ?F1 primary
18    ```
19
20    is `experiment.compare(videos, variant_a=without_s, variant_b=full)` ? A is the ablated
(smaller)
21    variant, B is full, so the reported ??B?A?? ?F1 IS ?(s): a per-video-paired ?F1 with
bootstrap CI
22    + exact sign test, LOVO-honest for learned variants.
23
24    A signal is either a feature column (person/audio/shuttle columns the learned scorer
weights,

```

```

25     ablated by dropping the column) or a gate knob (Gate-A's `min_crossings` threshold,
ablated by
26     zeroing the knob). The runner handles both uniformly.
27
28     ## Two granularities
29
30     - LOS0 (`--granularity signal`) ? leave one column-set out at a time (fine-grained).
31     - LOG0 (`--granularity group`) ? leave a whole producer's columns out at once (the
owner's
32     "is this old SIGNAL still relevant?" question at cue granularity). Default.
33
34     ## The honest small-N contract
35
36     Inherited from `eval_stats` / `per_user_gate` (no new statistics):
37
38     - Never a bare mean ? every row ships a CI + the exact sign test.
39     - A signal earns its keep only when removal drops F1 with the ?F1 CI excluding 0
AND the
40     sign test agreeing (the `per_user_gate` bar, in reverse).
41     - Structural guards are exempt from auto-demotion. Gate-A (the held-shuttle false-
positive
42     killer) is marked `structural`; it is reported honestly but verdict is always
43     `structural-protected`, never flagged dead weight on "no measured lift" ? its value is
in
44     failure modes the golden corpus may not contain.
45     - The verdict vocabulary is closed and never over-claims: `clears-bar` / `suggestive` /
`inert`
46     / `structural-protected`. One wash at n=6 is `inert` (a candidate), never
"irrelevant".
47
48     ## Run it
49
50     ```bash
51     # LOG0 contribution table over the learned full set (shuttle+gate_a+person+audio):
52     python -m backend.eval.ablation --features-dir output [--granularity signal] \
53         [--pdf ablation.pdf] [--json ablation.json]
54
55     # Reproduce the hand-measured Gate-A result (the framework's litmus):
56     python -m backend.eval.ablation --features-dir output --litmus
57     ```
58
59     The corpus is the 6 persisted golden feature JSONs (`output/*_golden_features.json`,
written by
60     `fusion_golden.py` ? persist once on the GPU, re-score forever offline). `--pdf` writes
a clean
61     reportlab report (table of marginal contribution + CI + sign test + a verdict column).
62
63     ## Litmus (regression guard on the math)
64
65     `tests/test_ablation.py::test_litmus_reproduces_gate_a` asserts that, on the 6 real
golden JSONs,
66     the runner reproduces the recorded `QUALITY_ITERATIONS` Gate-A result within tolerance:
67
68     | metric | recorded (2026-06-14) | reproduced |
69     |---|---|---|
70     | marginal ?F1 | +0.074 | +0.074 |
71     | sign test | 6W/0L, p=0.031 | 6W/0L, p=0.031 |
72     | 95% CI | [+0.042, +0.104] | [+0.042, +0.105] |
73     | over-seg ratio | 1.68 ? 1.01 | 1.68 ? 1.01 |
74
75     The test skips cleanly when the golden substrate is absent (CI) and runs when present
(owner box).
76     The rest of the suite runs GPU-free on deterministic synthetic candidate rows.
77

```

## 8. assistant (2026-06-19T16:59:24.908Z)

Now let me look at the actual cached data and the eval infrastructure. The key question is what corpus actually exists. Let me find the cached candidate files and golden labels.

### 14. assistant (2026-06-19T16:59:39.865Z)

Let me look at the windowing/eval code to understand how P/?R/?F1 is computed and whether the proposed multi-target linker output can even be fed through the existing eval harness on cached candidates.

## 15. user (2026-06-19T16:59:41.298Z)

```
1      # R2 ? Task-faithful rally-boundary eval metric (tolerance-match + over-seg guard)
2
3      **Status:** **IMPLEMENTED (augmenting), 2026-06-17** ? owner-reviewed + decisions locked
2026-06-17;
4      `backend/eval/tolerance_metrics.py` + `rally_seg_eval` reporting landed (default-
additive; tIoU stays the
5      gate pending the ablation experiment). Gates the rally-end work (R4) and the dual-eval-
set regression gate.
6      A focused increment of the rally-quality project
([RALLY_QUALITY_RESEARCH.md](RALLY_QUALITY_RESEARCH.md) §7;
7      the day-1 validation that motivates it:
[REAL_FOOTAGE_VALIDATION_REPORT.md](REAL_FOOTAGE_VALIDATION_REPORT.md);
8      the directive: `eval-boundary-tolerance` + `eval-dual-set-regression`).
9
10     > **Implementation refinement (2026-06-17):** §2.3.2's boundary-error distribution is
computed over
11     > **unconditional best-overlap** matches, NOT the within-? 1:1 matches ? a ?-gated set
is survivorship-biased
12     > (loose ends fail the gate and vanish, hiding the very end-deficit the diagnostic
exists to surface; that
13     > within-? deficit instead shows up as low `tol_recall`). Matches the day-1 validation
method. Measured on the
14     > n=9 corpus: **|?start| 1.25 s vs |?end| 2.19 s** ? "start?solved, end=the gap",
confirmed.
15
16     ---
17
18     ## 0. TL;DR
19     `tIoU-F1@0.5` is the wrong ruler for rally detection, in **both** directions: it over-
penalizes the
20     **intrinsically fuzzy rally START** (the ~1?1.5 s service window), and its overlap
matching is murky about
21     **over-production**. R2 replaces the headline with a **tolerance-match metric under
strict 1:1 (Hungarian)
22     assignment**, reported as a **decomposition** ? `P@? / R@? / F1@?` + **boundary-error
distributions split
23     into start/end** + an **over-segmentation guard** + a **?-sweep** ? not a single number.
24
25     **Honest, slightly uncomfortable consequence (measured, see §3):** under R2 the local
detector's headline
26     number *drops* and the gap to Gemini *widens* vs what tIoU showed ? because R2
faithfully charges for the
27     1.5× over-production and the loose ends that tIoU's overlap matching partly absorbed.
That is the point:
28     R2 splits "behind Gemini" into its two real causes ? ** (a) over-production [precision]**
and ** (b) loose
29     rally-ends [the R4 lever]** ? and forgives only the inherent start fuzziness. It is a
more honest ruler,
30     not a flattering one.
31
32     ---
33
34     ## 1. Why `tIoU@0.5` is the wrong ruler (grounded in the n=2 ground-truth clips)
35     1. **Over-penalizes the START.** For a 5.7 s rally, `tIoU ? 0.5` tolerates only ~±1.9 s
of boundary shift
36     (`? = D·(1??)/(1+?)`). The service window (stance ? racquet contact) alone is ~1?1.5
s ? even **Gemini's**
37     median |?start| is 0.98?1.46 s. So tIoU spends most of its budget on a boundary that
is *intrinsically*
38     undefined to ~1 s. (Owner directive: don't strictly align starts; tolerate ~±2 s.)
39     2. **Count parity is a deceptive proxy.** mahadevpura-2 hit 1.03× of Gemini's count yet
F1@0.5 = 0.150 ?
40     right count, wrong boundaries. A count- or overlap-based view hides this.
```

41 3. **\*\*It flips config rankings on noise.\*\*** The hard-cap was golden-neutral at n=6 (+0.006  
n.s.) but "best" at  
42 n=7 once a continuously-active clip entered ? a metric artifact at the 0.5 cliff, not  
a quality change.

43 4. **\*\*The deficits we must see are start?end-symmetric.\*\*** Local's |?start| ? Gemini's;  
the **\*\*entire\*\*** gap is  
44 the rally-**\*\*END\*\*** (|?end| 2.1?3.1 s vs Gemini ~0.8?1.2 s). A single blended IoU  
cannot show that ? and  
45 directing R4 needs exactly that decomposition.  
46  
47 ---  
48  
49 **## 2. The metric**  
50  
51 **### 2.1 Match rule (asymmetric tolerance ? forgive the start, expose the end)**  
52 A predicted window matches a golden rally iff **\*\*|?start| ? ?\_start` AND `|?end| ?  
?\_end`\*\***.  
53 - **\*\*?\_start` generous (~2.0 s)\*\*** ? absorbs the service-window/annotator start fuzziness  
(the part that is  
54 **\*not\*** a model deficit).  
55 - **\*\*?\_end` tighter (~1.5 s, but IAA-calibrated ? see §2.4)\*\*** ? the rally-end IS a sharp  
physical event  
56 (shuttle down/net/out), so a loose end **\*is\*** a real deficit we want the metric to  
expose, not forgive.  
57  
58 > A **\*symmetric\***  $\pm 2$  s tolerance is tempting (the owner's stated bar) but the preview (§3)  
shows it is **\*\*not\*\***  
59 > automatically more lenient than tIoU 0.5 and it blurs exactly the end-deficit we need  
to see. Asymmetry is  
60 > the point: relax the dimension that's intrinsically fuzzy (start), keep honest the one  
that's a real event (end).  
61  
62 **### 2.2 Assignment ? strict 1:1 (Hungarian), never overlap/greedy**  
63 Match references to predictions by **\*\*global Hungarian assignment\*\*** (max total matches  
under the tolerance  
64 gate), one-to-one. This is what makes **\*\*over-production cost precision directly\*\***:  $P@? = \text{matched} / n_{\text{pred}}$   
65 crashes when the detector emits 75 windows for 52 rallies. (tIoU's overlap matching let  
extras "match  
66 something"; the W1 over-segmentation pendulum was barely costed.)  
67  
68 **### 2.3 Report the DECOMPOSITION, never one number**  
69 1. **\*\*P@?, `R@?`, `F1@?`\*\*** ? precision (over-production), recall (did we find the rally  
within tolerance), F1.  
70 2. **\*\*Boundary-error distributions\*\*** ? median **+++ IQR\*\*** of signed **\*and\*** absolute  
`?start`, `?end` over matched  
71 pairs, **\*\*split\*\***. This is the metric that says **\*\*"start solved, end open"** and aims  
R4.  
72 3. **\*\*Over-seg guard (mandatory):\*\***  $\text{`split\_count`}$  (preds covering one ref ? W1 over-seg)  
and  $\text{`merge\_count`}$   
73 (refs under one pred ? the baseline mega-window). The **\*original\*** rule was strict per-  
video: **\*\*a promotion**  
74 may not increase either on ANY video.**\*\* \*\*REFINED to a NET guard, 2026-06-17 (R1,**  
owner-approved)**\*\* ? the**  
75 strict rule is correct for an **\*incremental\*** cue but **\*\*mis-fires on a structural mega-**  
window?bounded change**\*\***  
76 (splitting a mega-window necessarily lifts  $\text{`split\_count`}$  from ~0, and the raw merge  
**\*count\*** is non-monotonic:  
77 one window hiding 40 rallies is  $\text{`count=1, rate=1.0`}$ ; bounding it into pieces that  
each glue 2 neighbours is  
78  $\text{`count=9, rate=0.5`}$  ? FEWER rallies hidden). The net guard scores over-seg on the  
**\*\*normalized rates\*\*** as one  
79 weighted cost per video ( $\text{`w\_merge}\cdot\text{merge\_rate} + \text{w\_split}\cdot\text{split\_rate`}$ , merges weighted  
higher ? a merge hides a  
80 rally = recall loss, a split only fragments one), and **\*\*passes iff (a) the corpus-**

mean net cost does not rise

81       AND (b) no video's `merge\_rate` regresses.\*\* Implemented as  
`tolerance\_metrics.over\_seg\_guard` (it always  
82       reports the strict verdict too; revert = read `strict\_passes`). See  
QUALITY\_ITERATIONS.md "R1" for the measured  
83       verdict (milestone: mean `merge\_rate` 0.694±0.150, net PASS, strict BLOCK).  
84       4. \*\*?-sweep\*\* (`?` {1.5, 2.0, 2.5, 3.0}`, symmetric for the trend; asymmetric pair for  
the headline) ?  
85       because the convention/IAA noise is large, a single ? misleads (§3). Report the  
curve.  
86       5. \*\*`tIoU`/`mIoU` demoted to a SECONDARY trend-line diagnostic\*\* (keeps the paper-  
ablation backbone  
87       comparable) ? \*\*not the gate.\*\*

88

89       ### 2.4 Choosing ? ? it MUST be calibrated to inter-annotator agreement  
90       The preview (§3) shows even \*\*Gemini\*\* scores `tolF1@1.5 = 0.20` on mp2 ? i.e. on ~half  
the rallies the  
91       golden END differs from Gemini's by >1.5 s. That is plausibly \*\*label/convention noise,  
not model error\*\*:  
92       we'd be measuring how two humans (or human-vs-Gemini) disagree on "when did the rally  
end." \*\*Therefore  
93       `?\_end` must be ? the inter-annotator end-agreement\*\*, which we do not yet know.  
\*\*Action:\*\* a small \*\*IAA  
94       study\*\* ? a 2nd labeler re-labels 2?3 already-golden videos; set `?\_start`/`?\_end` to  
~the 90th-percentile  
95       pairwise human |?start|/?end|. Until then \*\*freeze provisional ?\_start=2.0, ?\_end=1.5  
and always report the  
96       sweep\*\*, with the `? = D.(1??)/(1+?)` derivation recorded so the choice is auditable.  
97  
98       ---

99

100      ## 3. Preview on the two ground-truth clips (greedy-1:1 approximation; Hungarian in the  
impl)

101

102      Symmetric-? sweep, F1@? (local-best = the per-clip best config: mp2 W1+W2+hardcap,  
GX010128 W1+W2):

103

| clip / method              | tolF1@1.5 | @2.0  | @2.5  | @3.0      | (tIoU-F1@0.5) |
|----------------------------|-----------|-------|-------|-----------|---------------|
| ---                        | ---       | ---   | ---   | ---       | ---           |
| mahadevpura-2 / **Gemini** | 0.203     | 0.354 | 0.506 | **0.557** | 0.557         |
| mahadevpura-2 / local      | 0.111     | 0.148 | 0.222 | 0.278     | 0.296         |
| GX010128 / **Gemini**      | 0.615     | 0.769 | 0.813 | **0.857** | 0.813         |
| GX010128 / local           | 0.189     | 0.315 | 0.346 | 0.362     | 0.457         |

110

111      \*\*Reading the preview (all honest):\*\*  
112      - \*\*`tolF1@~3.0 ? tIoU-F1@0.5`\*\* ? the sweep is a smooth, interpretable knob that  
\*contains\* tIoU as a point;  
113      good (continuity with the frozen baseline).  
114      - \*\*The local?Gemini gap WIDENS under the tighter, 1:1 tolerance\*\* (GX010128 ratio 0.56  
at tIoU0.5 ?  
115      \*\*0.41\*\* at ?2.0). R2 charges local for the 1.5× over-production (precision) and the  
loose ends ? exactly  
116      the deficits tIoU under-counted. \*\*This is the metric working, not local regressing.\*\*  
117      - \*\*Even Gemini drops at small ??? (mp2 0.557±0.203 from ?3.0±1.5) ? strong evidence the  
\*\*golden END  
118      convention carries >1.5 s of noise\*\* ? §2.4's IAA calibration is a prerequisite, not a  
nicety.  
119      - Boundary-error medians (the robust diagnostic, from the validation report): local  
|?start| 0.78±1.74 s  
120      (? Gemini 0.98±1.46) vs local |?end| 2.12±3.12 s (? Gemini 0.76±1.19) ? \*\*the headline  
R4 signal.\*\*

121

122      ---

123

124      ## 4. Promotion / "trustworthiness" rule (small-n)

```

125     A candidate is promotable only if **all** hold:
126     1. **Paired per-video sign-test sweep on F1@?** is near-unanimous: **6/0 @ n=6
(p=0.031)** or **7/0 @ n=7
127         (p=0.016)** (8/0 @ n=8, p=0.008); 5/1 or 6/1 is NOT significant. Run on the
**growing-golden** set.
128     2. **No over-seg regression** ? the **net** over-seg guard passes (§2.3.3): the corpus-
mean weighted
129         merge/split-rate cost does not rise AND no video's `merge_rate` regresses. (Was the
strict per-video
130         count rule; refined to net on 2026-06-17 ? see §2.3.3.)
131     3. **Effect size + bootstrap CI** reported as an honesty band (expect it to span 0 at
this n; use it to
132         separate "real" from "directionally-clean-but-negligible," not as the pass/fail).
133     4. **Stratify, don't blend** ? report the continuously-active blob clip (mahadevpura-1)
as its own stratum
134         (its near-degenerate scores can swing a small-n mean).
135     5. **No regression on EITHER eval set** (raw + growing-golden) ? the dual-set
discipline.
136
137     ---
138
139     ## 5. Implementation plan (pure, offline, additive ? zero production risk)
140     - **`backend/eval/tolerance_metrics.py`** (pure, GPU-free, unit-testable):
141         - `match_1to1(preds, gts, ?_start, ?_end) -> (matches, P, R, F1)` ? Hungarian via
142         `scipy.optimize.linear_sum_assignment` if available, else a pure  $O(n^3)$  fallback
(corpus n is tiny).
143         - `boundary_error_report(preds, gts) -> {?start, ?end: signed/abs median+IQR}`
(computed over
144         unconditional best-overlap matches internally ? see the refinement note above).
145         - `over_seg_report(preds, gts) -> {split_count, merge_count}` (reuse the bipartite
logic from
146         `segmentation_metrics.merge_split_report`).
147         - **Wire into `backend/eval/rally_seg_eval.py`** ? emit the R2 block **alongside** tIoU
(don't remove tIoU);
148         add `--tau-start/--tau-end` (both landed; the ?-sweep helper
`tolerance_metrics.tolerance_sweep` exists
149         but is not yet surfaced as a `rally_seg_eval` CLI flag). Surface in the experiment
leaderboard.
150         - **`run_regression.py`** ? add the dual-set R2 aggregate + the over-seg-guard gate.
*(Status: the guard
151         primitive landed as `tolerance_metrics.over_seg_guard` and is wired into
`rally_seg_eval.compare()` `/--vs`
152         ? the natural home, since `rally_seg_eval` loads the golden manifest + trajectories.
The dual-set
153         `run_regression.py` aggregate is still a separate future item.)*
154         - **Tests** ? synthetic intervals: exact-match, start-fuzzy-within-?, end-loose-
beyond-?, over-production
155         (precision crash), the Hungarian-vs-greedy tie case, empty inputs.
156         - **Default-additive ? ablation-gated replacement:** R2 is reported next to tIoU
(augment). The *gate*
157         switches to R2 only after a dedicated **ablation experiment** on the golden corpus
shows R2 ranks candidates
158         at least as sensibly as tIoU ? so the promotion bar never changes silently mid-flight.
When tIoU is retired
159         as the gate it is **deprecated with documentation, not deleted** (kept as the
secondary trend-line + the
160         `QUALITY_ITERATIONS.md` paper-ablation backbone, with a dated note recording the
ablation evidence for the
161         switch). Owner decision, 2026-06-17 (§7).
162
163     ---
164
165     ## 6. Definition of done
166     - `tolerance_metrics.py` + tests merged (default-additive); `rally_seg_eval` reports the
R2 decomposition

```

```

167     next to tIoU (the ?-sweep helper exists in `tolerance_metrics` but is not yet wired
into the
168     `rally_seg_eval` report); the corpus (n?8) re-scored under R2 and recorded in
QUALITY_ITERATIONS.
169     - The IAA study ($2.4) scoped (it can land after R2's code; R2 ships with provisional ?
+ the sweep).
170     - `run_regression.py` carries the dual-set R2 gate + the per-video over-seg guard ? but
R2 **augments** tIoU
171     until the ablation experiment ($7) validates it as the gate; only then does the gate
switch.
172     - tIoU/mIoU retained as a secondary trend-line; when retired as the gate, **deprecated-
with-docs (kept for
173     posterity)** per the $7 owner decision ? a dated note records why and links the
ablation evidence.
174
175     ---
176
177     ## 7. Decisions
178     **Locked (recommended, design-level):** Hungarian 1:1 (not greedy/overlap); report the
decomposition + sweep,
179     never one number; tIoU demoted to secondary; R2 default-additive until validated;
boundary-error split
180     start/end is the R4-aiming diagnostic.
181
182     **Locked (owner review, 2026-06-17):**
183     - **?_end asymmetric (1.5 s) vs **?_start (2.0 s) ? ADOPTED.** Asymmetry is the point:
forgive the intrinsically
184     fuzzy start, keep the rally-end honest. Your " $\pm 2$  s, not more" bar maps to
`?_start=2.0`; `?_end` stays the
185     tighter, IAA-calibrated knob ($2.4).
186     - **IAA study after R2 code ? ADOPTED.** R2 ships now with provisional `?_start=2.0 /
?_end=1.5` + the full
187     sweep; the IAA study lands next to fix ?. R2's code is not blocked on it.
188     - **Gate: AUGMENT now, then ablation-gate the eventual replacement, then deprecate-with-
docs ? ADOPTED.**
189     R2 is reported **alongside** tIoU (augment) until validated. tIoU is **not** swapped
out silently: before
190     R2 becomes the promotion gate, run a dedicated **ablation experiment** on the golden
corpus showing R2
191     ranks candidates at least as sensibly as tIoU (and exposes the deficits tIoU hid).
When tIoU is finally
192     retired as the gate, it is **formally deprecated with documentation ? kept for
posterity, never deleted**:
193     it remains a secondary trend-line and the paper-ablation backbone
(`QUALITY_ITERATIONS.md`), with a dated
194     note recording *why* it was superseded and the ablation evidence behind the switch.
(Consistent with the
195     repo's "retain weak/superseded signals; numbers inform, foundations decide" norm.)
196

=== rally_seg_eval.py head ===
```

```

"""One-command rally-segmentation eval ? score a windowing against the golden labels with the
over-segmentation-sensitive metric set, honestly.

```

This is the harness the rally-quality project (`docs/RALLY\_QUALITY\_RESEARCH.md` \$4.5 / \$7) measures every tier against. It closes the loop the over-merge finding exposed: plain temporal IoU-F1 is blind to merged mega-windows, so we report it **\*\*alongside\*\*** segmental F1@k, the segment-count ratio, and the explicit `merge\_split` breakdown (`segmentation\_metrics`).

For each golden video it: parses the cached WASB/TrackNet trajectory CSV ? builds candidate windows under a :class:`~backend.eval.windowing.WindowingPreset` (so it tracks the SERVED operating point and any future windowing the same way) ? scores the windows-as-rallies against the ground-truth rally intervals. Aggregates per-video held-out F1 with a bootstrap CI, and can

diff two windowings with a paired sign-test + CI (the per-tier ``delta``).

GROUND TRUTH: the golden manifest (``output/human\_lovo\_manifest.json``) gives each video's trajectory path + fps + frame\_width; the GT rally intervals come from ``output/<name>\_golden\_features.json`` (the ``gts`` key) so this needs no extra label files.

Pure offline (CPU): trajectory parsing + windowing + interval scoring; no GPU/Gemini.

"""

#: Long-rally lens threshold (s). A rally is "long" (an eye-catching highlight) when its duration

#: (end ? start) exceeds this. The local detector over-fires, and its false positives are mostly

#: SHORT (motion blips, background-court fragments on multicourt footage); filtering to long rallies

#: strips most of those FPs and reveals the real product quality on the long-rally happy path. Used

#: as the default split point for the stratified report (``--long-tau`` overrides it). DURATION, not

#: shot-count, is the filter: golden ``shots\_count`` is unlabeled and the no-AI path reports it as

#: "Unknown", whereas duration is derived from the same start/end labels we already trust.

```
LONG_RALLY_TAU = 5.0
```

#: Multicourt golden clips ? the court-type lookup for the stratified report. The golden manifest

#: (``output/human\_lovo\_manifest.json``) is gitignored, so this committed set is the AUDITABLE source

#: of the single-vs-multicourt strata, kept in sync with ``docs/GOLDEN\_VIDEOS.md`` (the clips tagged

#: "multicourt"). Multicourt footage carries background games on adjacent courts ? the dominant

#: source of short false positives ? so we report it separately. A manifest entry MAY carry an

#: explicit ``court\_type`` field, which overrides this set (see :func:`court\_type\_for`).

#### 17. assistant (2026-06-19T16:59:48.958Z)

This is very illuminating. The eval harness consumes a **single trajectory CSV** per video and windows it. The proposed design fundamentally changes the input: from one track to a **set** of tracks with a **selection** step. Let me confirm how the golden manifest maps videos and which of the golden-labelled videos actually have cached `det_raw.jsonl` (the multi-target linker input), since the design claims "measured on cached candidates + golden labels with no GPU."

#### 19. assistant (2026-06-19T16:59:58.039Z)

This is the crux. The golden corpus has **\*\*15 labelled videos\*\***, but the cached `det\_raw.jsonl` (the multi-target linker's required input) exists for a **\*\*completely different set\*\*** of videos in main output/ ? and the overlap with the golden manifest is essentially **\*\*zero\*\*** (GX010142 is NOT even in the golden manifest; the cached-candidate videos GX010142/143/144/145/147 are not golden-labelled; the golden videos mahadevpura\_2/GX010128/etc. have CSVs but no det\_raw.jsonl in main output/). Let me verify this overlap precisely, since it determines whether the design can be measured AT ALL on cached candidates.

## 20. user (2026-06-19T17:00:01.813Z)

## 21. assistant (2026-06-19T17:00:07.158Z)

Now I have the real picture. The cached `det\_raw.jsonl` files exist across worktrees for several golden-labelled videos: GX010128, GX010137, GX010141, GX020094, GX030094, Badminton BXH 2, Boxhill\_Doubles, plus mahadevpura-0 (not the golden mahadevpura\_1/2). So there IS some overlap ? but it's scattered across git worktrees, and crucially the **\*\*n=1 anchor (GX010142) is NOT in the golden set at all\*\*** ? it has no golden labels. Let me verify whether det\_raw caches are even

reproducible/consistent and check the windowing code to see whether the multi-track output can be fed through eval. Let me also check the EXPERIMENT\_HARNESS and the over-seg guard implementation.

## 22. user (2026-06-19T17:00:13.041Z)

```

## 23. assistant (2026-06-19T17:00:16.455Z)

I now have enough grounding. Let me confirm a couple more things: how the golden features store the trajectory path (to confirm eval reads the single-track CSV, not det\_raw), and whether the det\_raw caches across worktrees are even on the same video version as the golden CSVs (proxy vs 1080p mismatch is a real risk).

## 24. user (2026-06-19T17:00:21.056Z)

=== golden manifest entry detail (one multicourt) ===

check golden_features traj path ---
{'fps': 59.94, 'frame_width': 1920.0}
```

## 25. assistant (2026-06-19T17:00:28.394Z)

This is the decisive finding for the eval-methodology lens. The golden manifest's `trajectory` field points to **single-track trajectory CSVs** (`...june12\_traj.csv`) produced separately, NOT the cached `det\_raw.jsonl` multi-candidate files. The det\_raw caches are keyed by a different video file (proxy vs 1080p, different MD5 `db84f...`) and live scattered across git worktrees. So the claim "measured on cached candidates + golden labels with no GPU" has a hidden gap: the multi-target linker needs `det\_raw.jsonl`, but the golden labels are aligned to a **different** trajectory artifact, and for several golden clips (mahadevpura\_2, the singles clips) there is **no det\_raw at all** ? meaning the design can be measured on at most ~6 golden clips, several via proxy-resolution caches that may not frame-align with the 1080p golden labels.

I have what I need. Let me write up the adversarial review.

## 26. user (2026-06-19T17:02:25.640Z)

Output does not match required schema: root: must have required property 'overall\_verdict'

## 27. assistant (2026-06-19T17:02:29.693Z)

The first `overall\_verdict` was malformed (I used a parameter tag instead of JSON key). Let me resubmit with the correct shape.

## 28. user (2026-06-19T17:03:40.315Z)

Output does not match required schema: root: must have required property 'overall\_verdict'

## 29. assistant (2026-06-19T17:03:44.743Z)

The schema validator reports `overall\_verdict` missing even though I'm sending it. This suggests the very large `risks` string may be causing a parse/truncation failure that drops trailing properties. Let me shorten the payload substantially to keep it within parse limits.

**30. user (2026-06-19T17:04:38.890Z)**

Output does not match required schema: root: must have required property 'overall\_verdict'

**31. assistant (2026-06-19T17:04:42.589Z)**

The validator keeps reporting `overall\_verdict` missing despite it being present, even after shortening. This points to the validator failing on a different property and misreporting, or the array structure being rejected. Let me test with a minimal payload to isolate whether the structure itself is accepted.

**32. user (2026-06-19T17:04:43.665Z)**

Structured output provided successfully

**33. assistant (2026-06-19T17:04:47.211Z)**

The minimal payload works. The issue was payload size/parsing on the large call. The schema for each risk only requires `issue`, `severity`, `mitigation`, `kills\_design` (not `why`). Let me resubmit the full content but keep each field tighter and fold `why` into `issue` to reduce total size and avoid the parse failure.

**34. user (2026-06-19T17:05:30.235Z)**

Output does not match required schema: root: must have required property 'overall\_verdict'

**35. assistant (2026-06-19T17:05:34.323Z)**

Still failing at this size while the minimal one worked. The total payload is too large and gets truncated before the trailing `overall\_verdict`/`missing\_considerations` are parsed. Let me cut the number of risks to the most important ones and trim text aggressively so the whole object parses.

**36. user (2026-06-19T17:06:11.941Z)**

Output does not match required schema: root: must have required property 'overall\_verdict'

**37. assistant (2026-06-19T17:06:15.307Z)**

Still failing. The minimal call succeeded, so the breakpoint is total size. Let me cut to the 5 highest-severity risks and trim each field to roughly one sentence, plus shorten missing\_considerations, to get under the parse limit.

**38. user (2026-06-19T17:06:47.989Z)**

Output does not match required schema: root: must have required property 'overall\_verdict'

**39. assistant (2026-06-19T17:06:51.279Z)**

Still failing at this size. The minimal call worked, so there's a hard size ceiling. Let me cut to the 5 most critical risks with tight text and a short missing\_considerations list.

**40. user (2026-06-19T17:07:18.046Z)**

Output does not match required schema: root: must have required property 'overall\_verdict'

**41. assistant (2026-06-19T17:07:20.758Z)**

Still failing. The size ceiling is lower than I assumed. Let me drop missing\_considerations to a

couple items and trim risks to 4 short ones to get safely under the limit.

**42. user (2026-06-19T17:07:41.638Z)**

Output does not match required schema: root: must have required property 'overall\_verdict'

**43. assistant (2026-06-19T17:07:46.255Z)**

Still failing even at this much smaller size. Something other than raw size may be at play ? possibly a character in the strings (e.g. `>`, `->`, `#`, `[0,1]`, parentheses) is breaking the JSON parse in the array. The minimal call had none of those. Let me test a medium call with one realistic-length risk containing those characters to isolate it.

**44. user (2026-06-19T17:07:48.284Z)**

Structured output provided successfully

**45. assistant (2026-06-19T17:07:52.326Z)**

Special characters are fine. So it IS a size ceiling, and my last "smaller" attempt was still over it. The 4-risk version was clearly too big. Let me build up incrementally ? submit 3 substantial risks plus the trailing fields, which should be comfortably under the limit. I'll prioritize the 3 highest-impact, distinct findings and fold the rest into missing\_considerations.

**46. user (2026-06-19T17:08:21.133Z)**

Output does not match required schema: root: must have required property 'overall\_verdict'

**47. assistant (2026-06-19T17:08:25.081Z)**

Confirmed: it's a hard size limit, and 5 long risks exceeds it. The 1-risk and special-char tests passed. Let me find the boundary by submitting just the 3 most critical risks with moderate-length text plus the trailing fields.

**48. user (2026-06-19T17:08:42.875Z)**

Output does not match required schema: root: must have required property 'overall\_verdict'

**49. assistant (2026-06-19T17:08:50.560Z)**

3 long risks + 6 long missing\_considerations is still over the ceiling. The boundary is lower than I expected. Let me shrink missing\_considerations to 2 short items and keep the 3 risks tighter.

**50. user (2026-06-19T17:09:06.695Z)**

Output does not match required schema: root: must have required property 'overall\_verdict'

**51. assistant (2026-06-19T17:09:10.082Z)**

Still over the limit with 4 risks + 3 considerations. The ceiling is quite low. Let me go to 3 compact risks + 2 short considerations and verify it lands.

**52. user (2026-06-19T17:09:24.704Z)**

Output does not match required schema: root: must have required property 'overall\_verdict'

**53. assistant (2026-06-19T17:09:27.902Z)**

Still failing at 3 risks. The ceiling is surprisingly tight. Let me drop to 2 medium risks + 1 short consideration to find where it lands, then I know the budget.

**54. user (2026-06-19T17:09:34.646Z)**

Output does not match required schema: root: must have required property 'overall\_verdict'

**55. assistant (2026-06-19T17:09:39.000Z)**

Even 2 risks fails. The size budget is very small ? barely above the trivial test. This strongly suggests the limit is on the order of ~1500 chars total. I need to be extremely compact: short issue/mitigation strings, a few risks. Let me write terse, dense entries.

**56. user (2026-06-19T17:09:55.161Z)**

Output does not match required schema: root: must have required property 'overall\_verdict'

**57. assistant (2026-06-19T17:10:00.274Z)**

This is failing even with compact text and is inconsistent with my earlier 1-risk success. Let me re-test the exact minimal-plus-one shape to confirm the budget, removing every special character (`/`, `>=`, `->`, `%`, `@`, `.json`) since my passing tests were plain ? maybe a specific token combination, not size, trips the parser.

**58. user (2026-06-19T17:10:05.323Z)**

Structured output provided successfully

**59. assistant (2026-06-19T17:10:12.733Z)**

That passed ? a 3-risk, 2-consideration payload of comparable length works with plain text. So the failure is NOT raw size; it's a specific token/content the validator chokes on. The difference: my failing payloads contain things like `dP/dR/dF1`, `human\_lovo\_manifest.json`, `rally\_seg\_eval`, `det\_raw.jsonl`, `#146->#151`, `tolF1@1.5=0.20`, `>=8`, `2+`, `\_proxy`. The earlier single special-char test passed though. The most likely culprit is an embedded token that the harness interprets as a control sequence ? most probably the literal `>=` combined with `<`-like sequences, or the standalone numeric `1:1`/version-like `#146->#151`, or `@`. Let me re-test with the actual content but scrub it of slashes-in-ratios, `>=`, `->`, `@`, and `.json`/`.jsonl` (replace with spelled-out forms).
