1. user (2026-06-20T07:56:33.815Z)

Resume the KhelSutra brand-site work. Repo avidullu/khelsutra (site in site/; engine = the badminton-highlight-indexer). Get current: read the 2026-06-20 handoff at the top of memory current-state.md ? khelsutra-domain-launch.md + khelsutra/NEXT_STEPS.md. State: khelsutra.guru is LIVE (Cloudflare Worker + D1; merge to master auto-deploys; CI npm test=20 green); a portable Node+SQLite twin runs at the droplet http://168.144.126.176:8787 (both byte-in-sync via scripts/parity-check.sh); each registration emails me + persists to D1. ? The droplet is a shared storage testbed ? don't touch ports 9000/9001/9023 or /root. Today let's pick up: <#1 interactive per-rally selection> (or your choice). Start with a tracked design doc per the repo convention before building.

2. assistant (2026-06-20T07:56:40.618Z)

I'll get current first. Let me read the handoff breadcrumbs and pull the relevant repo.

3. user (2026-06-20T07:56:41.531Z)

```
1      ---  
2      name: current-state  
3      description: "Live micro-checkpoint state for Claude ? updated every checkpoint (not  
only on request). What just landed, what's next, open decisions."  
4      metadata:  
5          node_type: memory  
6          type: project  
7          originSessionId: b13673cc-f087-43b1-9527-35dc0b67b301  
8      ---  
9  
10     # Current state ? updated continuously (see [[working-agreement-checkpoints]])  
11  
12     > **Scope of this file = LIVE only:** the current handoff + *today's* checkpoints + open  
PRs/decisions. Keep it read-first-short (?1 page). Older checkpoints are archived in [[current-  
state-archive]] ? when today's checkpoints age out (next clean-slate day), move them there,  
don't let them pile up here.  
13  
14     **? HANDOFF (2026-06-20) ? KHELSUTRA.GURU brand site: shipped, live, portable. Resume  
the product threads below.** Separate track from the indexer rally-detection handoff that  
follows. Full durable record + ramp-up: [[khelsutra-domain-launch]]. Repo =  
**avidullu/khelsutra** (NOT this indexer repo).  
15     - **DONE + LIVE this session (PRs #1?#8, all merged, repo clean):** owner bought  
khelsutra.guru ? built & launched end-to-end. On **Cloudflare** (Worker `hidden-king-khelsutra`  
+ D1 `khelsutra-access`; **git-connected ? merge `master` auto-deploys**); CI runs `npm test` =  
20 green): landing page + `/capture` checklist + OG image + a **segmented Request-Access form**  
(academy/individual + GPU + storage Qs + free text) ? persists to D1 **and emails a summary to  
avi.dullu@gmail.com per registration** (Email Routing send binding ? VERIFIED live in inbox).  
Valid SSL; `hello@` Email Routing verified.  
16     - **PORTABLE + proven**: identical form runs on a dependency-free **Node + SQLite** host
```

```
(`site/server.js`), **live + browsable on the owner's DO droplet ? http://168.144.126.176:8787**
(systemd `khelsutra-site`, isolated `/srv/khelsutra-site`; SSH key `~/ssh/khelsutra_droplet`).
Both-hosts compat ENFORCED in CI (`site/src/server.test.js` boots the real server). ? Droplet is
a SHARED storage testbed ? another session runs MinIO 9000/9001 + GCS emu 9023 +
`/root/do_gcs_`; STAY CLEAR. Docs: `docs/REQUEST_ACCESS_FORM.md`, `docs/PORTABILITY.md`,
`NEXT_STEPS.md`.
17 - **? PENDING / next threads (owner ideas this session):** (1) **Marketing video** ? use
Grok/Gemini image-gen ? a short video themed for *serious enthusiasts* showing the whole
record?reel process ? embed on the site. (2) **Interactive per-rally selection** (big product
feature) ? the engine detects rallies ? present them in a UI so the user **picks which rallies
go into the highlight** (dynamic, NOT a fixed setting); pairs with the "ask for a reel"
conversational builder already teased on the site. (3) productionize droplet (TLS +
`vm.khelsutra.guru`), VM-path SMTP email (currently noop), Always-Use-HTTPS/HSTS, Web Analytics
token, `/capture.html`?`/capture` footer link, delete any orphan `khelsutra-site` Worker, clean
CF D1 test rows (`deploy-test@`/`email-test@`). Revoke the droplet SSH key when done. [[paper-
coauthor-aim]] [[monetization-plan]]
18
19 ---
20
21 **? HANDOFF (2026-06-19, clean-slate) ? NEXT SESSION START HERE for the prominent-court
/ multi-shuttle DESIGN journey.** Owner is "ramping up on the design mindset"; the prior
session's context filled after a marathon (9 PRs merged today:
#220/#237/#238/#239/#240/#241/#242/#243/#244). Owner asked for an honest call ? handed off here
so the design work continues fresh.
22 - **WHERE WE ARE (prominent-court track, gap-closure G2):** designed + built +
validated. `docs/PROMINENT_COURT_DETECTION.md` (tracked, C0-C8) is the design.
`backend/pipeline/detectors/court_gate.py` (default-OFF, merged #243) has the **window-level**
gate `gate_intervals_to_court` (drop a rally whose shuttle is MAJORITY outside a normalized
`court_polygon`) ? wired into `rally_seg_eval.windows_for` via a per-video `court_polygon`.
Validated on GX010142: cleanly drops the adjacent-court FPS incl the owner's rally #1, zero
central false-drops. $4.5 (#244) captures the owner's **floor/white-line shuttle-floor-contact =
deterministic rally-END** idea (C8, targets G3).
23 - **? VALIDATIONS LOGGED (2026-06-19, `scratch/validate_multishuttle_142.py`) ? answers
the owner's 3 questions:**
24 - **Q1 CAN WASB GIVE ALL SHUTTLES? YES.** Code: `~/models/WASB-
SBDT/src/detectors/postprocessor.py::detect_blob_concomp` loops ALL connected components (no
top-k/cap) ? detector returns every ?0.5 heatmap blob; the tracker is the sole single-shuttle
reducer. Data: ?2-candidate frames are a STABLE venue property ? GX010142 31.2% / 143 32.3% /
145 26.7% / 147 27.7%, max 6/frame; the 2nd-best blob-mass (median 9.5-11.7) is comparable to
the top (13.7-14.9) ? genuine, not noise. Bound: "all" = all the model fires ?0.5 on (a
small/distant 2nd shuttle it misses won't appear; some ?2 are noise ? selection must
disambiguate).
25 - **Q2 CAN WE PICK THE PROMINENT SHUTTLE? YES.** A court-AGNOSTIC greedy multi-target
linker over the cache found 9 tracks in 21-25s; the **LONGEST/most-continuous (2.4s) is the
ADJACENT one** (xmean-norm 0.90) ? naive "pick longest/most-confident" (? what the single
tracker does) picks WRONG; a court+motion+vertical-excursion objective correctly flags the
prominent fragments (xmean 0.44-0.68, in-court 100%). Caveats: prominent rally came back
FRAGMENTED (~4 tracks ? need same-court fragment stitching; the time-windower mostly does this);
separated cleanly because courts are X-apart HERE (X-overlapping courts need a reliable court
signal ? Q3).
26 - **Q3 DO PERSON + FLOOR COALESCE? PARTLY ? fusion design sound; person input is
USABLE (? EARLIER "BLIND DETECTOR" CLAIM RETRACTED).** ? **CORRECTION (2026-06-19):** my first
Q3 read MISPARSED `output/person_GX010142.json` ? the 3rd field is box **AREA**, not confidence
(dets are already filtered conf?0.5 in `person_detector.py::detect_and_track`). **FasterRCNN-
ResNet50-FPN (BSD) IS firing**: **2.86 confident boxes/frame** (8551 over 2994 sampled frames;
histogram 2-4/frame). During the prominent rally ~2.9 players/frame cluster centrally (cx
0.32-0.46) ? **CAN anchor the prominent court**. BUT players are present during rally#1 too
(~2.2/frame, some central) ? **mere OCCUPANCY does NOT separate the FP from the real rally; the
discriminator is player MOTION/activity (Lever A), not presence** (my "occupancy 0" was the
area-as-conf bug, now fixed). Floor: prominent fragment descends only to y-norm 0.64 (no landing
in 2.4s) + player-feet floor estimate unreliable ? **floor must come from COURT-LINE detection
($4.5/C8), not feet**. ? person+floor CAN coalesce; right person feature = **motion not
presence**; no urgent detector replacement. Open (owner): person-signal QUALITY/court-assignment
+ the Qwen-unification strategy question (owned-model Gen-2, owner-gated) as pieces grow.
27 - **? GOLDEN TRUTH TEST ? GX010128 (2026-06-20,
```

`scratch/eval\_multitrack\_gx128\_golden.py`; fresh WASB run db84f3e6, resumable cache, keepawake+watchdog) ? VERDICT: multi-track does NOT beat baseline ? NO PR.** vs the 52 golden rallies: **baseline single-track F1 0.60 (P/R 0.49/0.77), tolF1 0.47, spurious 25.** Multitrack with the rally-likeness gate **REGRESSED to F1 0.34 (recall 0.33!)** ? the yspan/motion thresholds (tuned on 142's CLEARS) destroy recall; band widening barely helped (0.34?0.38) so the band is NOT the lever. Recall-preserving **court-ONLY selection recovers to F1 0.55 / recall 0.73 / tolF1 0.48 ? baseline ? but spurious 25=25 UNCHANGED.** ? **GX010128's over-fire is ON-COURT over-segmentation, NOT adjacent-court** (confirms the earlier state note) so the court-aware/multi-track lever has nothing to grab here. **Conclusions:** (1) multi-track is a **TARGETED lever** ? recovers specific tracker-discarded rallies (the 142 anchor) + drops adjacent-court FPs **where a separable adjacent court exists** (Boxhill_Doubles, where the merged #243 court_gate already showed ?F1 +0.078); it is **NOT a general F1 improver**. (2) selection MUST be **recall-preserving (court-membership only, never hand-tuned rally-likeness)**. (3) **Gemini-reference over-sold it** (precision-up/over-fire-halved looked good; golden truth = neutral-to-negative). Next real test = a **separable-adjacent-court golden clip** (Boxhill_Doubles) ? needs a GPU WASB run on its video (NOT local; GX010128 was the only local golden clip). **GHOST: confirmed on GX010128 ? fixed pixel (936,492) in 5617 frames (~20%!), but stationary ? dead-time, NOT a spurious-rally driver (spurious 25 with/without it); likely costs recall by occupying the tracker ? its own data-quality item, not the headline.** [[decision-rigor-norm]] [[eval-dual-set-regression]] [[paper-coauthor-aim]]

28 - **? (a) ZERO-GPU GENERALIZATION REPLAY (2026-06-19, `scratch/eval\_multitrack\_19june.py`) ? MIXED, NOT PR'd yet (honest):** multi-track court-aware selection vs single-track baseline, windowed identically (SERVED), scored vs the GEMINI REFERENCE (reference?truth, D3) on cached 142/143/145. Configured-band results: **142 prec 0.45?0.62 rec 0.83?0.75 ?; 143 prec 0.50?0.64 rec 0.95?0.90 ? (clean wins); 145 prec 0.31?0.39 rec 0.77?0.55 ?.** TOTAL: **precision 0.41?0.55, over-fire 2.08x?1.33x (nearly halved), recall 0.85?0.73 (real cost).** Diagnosis (visual `artifacts/multishuttle\_142/replay\_\*.png`): the MECHANISM works; two gaps block a clean win ? (1) **court AUTO-derivation is fragile** (foreground-depth heuristic under-sized 145's band to 0.05-0.59, halving the court ? use configured polygon MVP meanwhile); (2) **rally-likeness thresholds (yspan/motion, hand-tuned on 142's high CLEARS) over-reject FLAT rallies on 145** ? needs DATA-DRIVEN tuning on golden, not hand-set thresholds (the n=1-overfit risk, now real). ? **HOLDING the PR** until the golden read disambiguates Gemini-reference noise. **GX010128 golden+ghost WASB run launched (bg, `output/19june\_work/gx128\_wasb.log`)** ? golden multicourt clip WITH the stuck-tracker ghost, 1080p/59.94 coords match golden labels ? the decisive truth test. Analysis staged: `scratch/eval\_multitrack\_gx128\_golden.py`.

29 - **? SHUTTLE-ONLY MULTI-TRACK SELECTOR BUILT + VISUALLY VALIDATED (2026-06-19, `scratch/multitrack\_select.py`; prototype, NO PR yet):** Layer-1 court-agnostic greedy multi-target linker over the cached candidates (zero GPU) + Layer-2 court-membership (configured prominent X-band, route-1 MVP) + rally-likeness (dur/yspan/motion) selector. Visually validated on 3 GX010142 windows (`artifacts/multishuttle\_142/select\_0|1|2.png`): GREEN=selected prominent rally, RED=rejected adjacent court+noise. **21-25s: 9 tracks?4 prominent selected; the NAIVE "pick-longest" track is the ADJACENT one (2.4s, xmean-norm 0.90) ? court-aware picks RIGHT where naive picks WRONG.** Adjacent-court contamination present in ALL 3 windows + consistently rejected (generalizes beyond the multi-shuttle case). ? Caveats seen: (1) **fragmentation** ? the prominent rally splits into several tracks (esp. long rallies); cleaner design = link?MERGE same-court fragments into a group?score the group (time-windower mostly stitches contiguous greens anyway); (2) court spec here = configured X-band, auto-derivation (shuttle-density or now-usable person-anchor) is the upgrade; (3) GX010142 only ? next = multi-clip replay + golden ?P/R/F1 before any flip. **Person session spun off (chip `task\_01e00617`).**

30 - **? THE LIVE DESIGN CRUX (validated on real data ? pick this up):** the gate works on the single TRACKED shuttle, but the **tracker** (not the detector) collapses to one shuttle/frame. ? **CORRECTION (2026-06-19, `det\_raw.jsonl` probe ? refutes the earlier "isn't in the data / can't be saved"):** WASB's **detector already emits MULTIPLE shuttle candidates/frame** (cached in `det\_raw.jsonl`; ?2 candidates on **31%** of detected GX010142 frames). It is the single-target **online tracker** (`wasb\_infer.py:537 tracker.update`) that discards all-but-one. MEASURED on GX010142 rally #3 (21-25s): the *tracked* shuttle is 94% adjacent-court (x-norm ~0.88), BUT the raw candidates ALSO carry a **prominent-court shuttle in 83% of the window's frames** (x-norm ~0.56), **both shuttles present in 76%**, and a greedy-NN reconstruction yields a **continuous prominent-court rally track** (75% coverage, 431px vertical excursion, 8.6px median per-frame jump, ~2.4s sustained). **So the prominent rally the owner saw IS in the data** ? recoverable by **multi-track selection over the already-cached candidates (zero GPU)**, just not by gate-tuning the single track. ? reframes the whole thread: the ceiling is **track SELECTION, not the eyes**. **NEXT DESIGN THREAD: multi-track + court-aware selection** (a window is valid if ANY sustained track lives in the prominent court) ? this is

****recall-positive**** (recovers the prominent rally, a G1 miss) AND precision-positive (drops the adjacent one), unlike the current subtractive single-track gate. It also subsumes the ****ghost**** (a stuck-pixel track has ~0 motion energy ? never selected). Repros:
`scratch/analyze\_multishuttle\_142.py` + `scratch/reconstruct\_prominent\_track\_142.py` +
`scratch/overlay\_tracks\_142.py` (trajectory overlay) +
`scratch/extract\_multishuttle\_frames\_142.py`. ? ****VISUALLY CONFIRMED (2026-06-19,**
`artifacts/multishuttle\_142/tracks\_overlay\_crop.png`):****** the green prominent track is a textbook
****rally arc anchored to a player mid-stroke**** (bottom-left) ? second player (center) ? a real
foreground-court rally; the yellow tracker output is a tangle over the ****far-right adjacent**
court** (player at right margin). Two shuttles, two courts, detector saw both. ? Corrected mid-
investigation: the adjacent track is NOT a static fixture (528px y-span ? a real moving adjacent
rally). ? Still n=1 clip; 31% multi-candidate includes detector noise (selection scoring must
disambiguate). Owner collecting more two-shuttle examples; ****DO NOT PR yet**** (owner's call ?
this is design).

31 - ****OTHER OPEN THREADS:**** (C6) ****player-anchored polygon auto-derivation**** ? person
features ALREADY extracted on GX010142 ? `output/person\_GX010142.json`
(`scratch/extract\_person\_19june.py`; median 3 players/frame). Raw player COUNT doesn't separate
rally #1 (need court-LOCALIZED occupancy via `fusion\_features.in\_court\_counts` + the same
polygon ? players inside the prominent court ? 0 during rally #1). Foot-points can auto-derive
the polygon. (Analysis DONE) ****multicourt quality workflow measured the gate vs golden on the 4**
multicourt clips ? `output/multicourt\_analysis.md`. Honest result: the gate is a ****REAL**
precision win ONLY where a genuinely separable adjacent court exists****** ? ****Boxhill_Doubles ?P**
+0.096 / ?F1 +0.078, recall FLAT, 20 adjacent-court FPs dropped (all median x>0.80)**.
NULL/marginal elsewhere: mahadevpura_2 +0.025 (trims 4 edge FPs, no separable court), ****GX010128**
+ Badminton_BXH_2 = exact NULL** (their over-fire is on-prominent-court over-merge/boundary FPs
the court gate can't touch, NOT adjacent-court rallies). ? ****2nd detection-layer finding**
(besides single-shuttle): STUCK-TRACKER artifacts****** ? GX010128 has 284 pts at exactly x=1680px,
BXH_2 ~41% of pts parked at court-center ? a fixed-pixel WASB false-lock (a data-quality bug,
not a court issue). ? NO Gemini preds for these ? "closeness to Gemini" can't be direct; Gemini-
on-multicourt run = a follow-up (alias degraded today). ****Verdict: the prominent-court gate is a**
worthwhile precision lever for TRUE multicourt (separable adjacent court), not a cure-all for
multicourt over-fire (which has 3 distinct causes: adjacent-court rallies [gate fixes], on-court
over-merge [other levers], stuck-tracker [detection fix]).**

32 - ****RAMP-UP KIT:**** `docs/PROMINENT\_COURT\_DETECTION.md` (the design + tracker) .
`backend/pipeline/detectors/court\_gate.py` + `backend/pipeline/detectors/wasb\_runner.py` (the
single-shuttle constraint) . `tests/test\_court\_gate.py` . the litmus pattern in this session
(`windows\_for` + `gate\_intervals\_to\_court` on a cached `output/wasb/<clip>\*\_wasb.csv`) .
`docs/RALLY\_DETECTION\_GAP\_CLOSURE.md` (G1/G2/G3) . scratch: `analyze\_19june.py`,
`extract\_person\_19june.py`. ****Branch:**** currently `docs/court-floor-rally-end` (merged); base
new work off `origin/master`. **[[paper-coauthor-aim]] [[decision-rigor-norm]] [[working-**
agreement-merging]]

33

34 ****Checkpoint:**** 2026-06-19 (? ****PROMINENT-COURT DESIGN+EXPERIMENT + DOC-STALENESS SWEEP**
? 3 MORE PRs MERGED (#241/#242/#243)). Owner directive: "extract person features" + "build up
the 'prominent court' concept and make a design" (in multicourt, the foreground court covers the
majority of the video area ? keep only shuttle rallies in it; may need a 'pseudo-3D' court
model; experiment = `(x,y,visible)` ? `visible-in-prominent-court`) + "fix all staleness in the
design docs and code, ultracode on, spin off agents" + ****"auto accept, I'll be back, make and**
merge PRs" (broad autonomy granted).

35 - ? ****PROMINENT-COURT (gap-closure G2 / multicourt over-fire):**** born from owner's
****GX010142 rally #1**** = a shuttle in the far-right adjacent court (verified: shuttle median
X-norm ****0.85****) that formed a 2.94s FP. ****[#241](https://github.com/avidullu/badminton-**
highlight-indexer/pull/241) design doc****** `docs/PROMINENT\_COURT\_DETECTION.md` (tracked, C0-C7; 2D
floor polygon ? pseudo-3D play-volume; reuse
`point\_in\_polygon`+`FusionConfig.court\_polygon`+`PersonDetector.detections\_per\_frame`).
****[#243](https://github.com/avidullu/badminton-highlight-indexer/pull/243)** experiment******
`backend/pipeline/detectors/court\_gate.py` (default-OFF): ****WINDOW-level**** gate
`gate\_intervals\_to\_court` (drop a rally whose shuttle is MAJORITY out-of-court) wired into
`rally\_seg\_eval.windows\_for` via a per-video `court\_polygon`. ****KEY litmus finding:**** point-
level gating is TOO LEAKY ? rally #1 is 90% adjacent-court but a 10% central tail (12/121 pts)
holds the window, surviving every 1D cut 0.66-0.82; the ****window gate cleanly drops 6 rallies**
(all median X-norm 0.85-0.97 incl rally #1) with ZERO central false-drops.** ? confirms the
design: 2D region + window-majority gate, NOT a 1D cut. ? Litmus polygon is crude/manual;
****product path auto-derives it from PLAYER location (C4/C6)****. Eval n=15 UNCHANGED (no-op
without polygon). 22 gate tests + suite 916 green, cov 83.07%.

36 - ? ****PERSON FEATURES (C4) RUNNING (GPU):**** `scratch/extract\_person\_19june.py` runs
`PersonDetector.detections\_per\_frame` on GX010142 proxy ? `output/person\_GX010142.json` for (a)
player-anchored prominent-court derivation, (b) the rally-#1 "prominent players have not
started" check (owner insight ? the PERSON-occupancy signal is the OTHER half of the rally-#1
fix; the court gate handles the shuttle side), (c) `shuttle\_player\_colocation` held-vs-flight.
****shuttle_player_colocation IS BUILT**** (`fusion\_features.py:168`, default-OFF, unmeasured) ?
corrected in the doc sweep.

37 - ? ****DOC-STALENESS SWEEP [#242](https://github.com/avidullu/badminton-highlight-indexer/pull/242):**** ran a ****multi-agent Workflow**** (7 themed auditors ? per-file adversarial
verify; 30 candidates ? ****25 confirmed****, each verified verbatim vs source). Fixed: signal
build-status (Gate B / person cue / `shuttle\_player\_colocation` / `net\_crossings`
"[design]/NEW/unbuilt/eval-only" ? built-default-OFF-unmeasured), corpus n=6/9/12/13 ? ****n=15****,
CODE_MAP #233/#234 module moves, milestone-flip "owner-gated" ? LAUNCHED #204,
CLAUDE.md/NEXT_STEPS GPU staleness, splits.py-DONE-#171, R2 `boundary\_error\_report` signature. ?
One audit agent edited `R2\_EVAL\_METRIC\_DESIGN.md` directly (rogue but accurate + in-scope) ?
verified + included. Reusable: `output/\_staleness\_fixes.json`.

38 - ? ****STILL IN-FLIGHT:**** #243 CI (1 check, ? merge on green); person extraction (GPU).
****NEXT:**** analyze person features ? player-anchored polygon auto-derivation (C6) + rally-#1
player-activity check + colocation measurement; consider wiring the court gate into the SERVED
fusion path. [[decision-rigor-norm]] [[working-agreement-merging]] [[paper-coauthor-aim]]

39

40 ****Checkpoint:**** 2026-06-19 (? ****BOXHILL 19-JUNE LOCAL >7s EXTRACTION + GEMINI COMPARISON**
+ 4 DUE-DILIGENCE PRs MERGED**). Owner: sync to remote head, verify sane, GPU local-only >7s
extraction on 4-5 19-June videos ? new G: dir, Gemini comparison on 2-3 for golden-labeling,
learnings on local-vs-Gemini gaps, fix issues via PRs as I go. ****This box IS the owner's Windows**
machine** (CLAUDE.md "dev container lacks GPU/cv2/numpy" is fully STALE ? GPU+WSL+WASB all live
here; RTX 2070 Super Max-Q).

41 - ? ****Synced to origin/master**** (local `master` is 50 behind + locked by stale
`.claude/worktrees/tier1-windowing` worktree ? based work on `origin/master` directly). ****Found**
+ fixed a MASTER-BREAKING bug ? [#237](https://github.com/avidullu/badminton-highlight-indexer/pull/237) MERGED:
****test_ablation**** called `ablation.\_is\_fusion\_schema` (moved to
`experiment` by the #215/#235 SSOT refactor) ? ****AttributeError at COLLECTION time ? whole local**
suite red** (green in CI only because the golden glob is empty there ? same green-CI/red-locally
class as #236). Fix: import from the SSOT. Suite then 904 pass, cov 82.98%. ****Quality NOT**
regressed** (n=15 tIoU F1@0.5 0.468, R2 toIF1 0.353, identical).

42 - ? ****3 more PRs MERGED**** (all verified-green, owner-authorized):
[#238](https://github.com/avidullu/badminton-highlight-indexer/pull/238) `--min-rally-duration`
CLI flag (surfaces #220's knob); [#239](https://github.com/avidullu/badminton-highlight-indexer/pull/239) re-baseline the nightly regression to n=15 (was red on corpus-growth, NOT a
quality regress); [#240](https://github.com/avidullu/badminton-highlight-indexer/pull/240)
****gemini surfaces failed chunks LOUDLY**** (a timeout/503-exhausted chunk silently dropped its
time range ? partial reel that looked complete; mirrors the oversize guard).

43 - ? ****INFRA FINDINGS (3):**** (1) ****gemini-flash-latest` alias is currently DEGRADED**** ?
11.6s for a trivial-text query vs `gemini-2.5-flash` 1.3s ? video chunks blew the 180s timeout ?
0 rallies (this is why the prior Gemini run "hung"). Pinned 2.5-flash for the reference run; did
NOT change the repo default (owner-gated model choice ? FLAG for owner). (2) ****WASB**
`timeout\_sec=1800` (30min) too tight** for long 59.94fps clips: GX010144 (12.8min, ~43min WASB
at ~3.4x RT) + GX010147 timed out ? 0 rallies (surfaced clearly in run.log, not silent). Re-
running with 5400s. (3) ****GoPro 4K is HEVC Main10/10-bit**** ? `h264\_nvenc` can't encode ? proxies
need `format=yuv420p` (8-bit). GPU-decode proxy (NVDEC?scale_cuda?NVENC) ~4.5x RT.

44 - ? ****LOCAL >7s reels published to `G:\Boxhill\2026-06-19 Boxhill - Local no-AI (7s+**
rallies)** (cap=6+R4 milestone config, `--min-rally-duration 7`, fully local): ****all 5 reels**
DONE** ? GX010142 (44 rallies?3 >7s**), GX010143 (38?7**), GX010145 (55?6**), GX010144
(58?12**), GX010147 (40?11**) = 39 >7s clips total. 144/147 first TIMED OUT at the 30min
WASB default (12.8min + a slow-running 7min clip) ? re-ran at 5400s timeout. Detect on 1080p
proxies in `F:\KheI\Sutra\_work\19june\_proxies/`.

45 - ? ****GEMINI COMPARISON (3 single-court clips, 142/143/145; reusable**
`scratch/analyze\_19june.py`, gemini intervals `output/gemini\_\*\_19june.json`, local in
`output/19june.db`): ****Local OVER-FIRES 2.08x (137 vs Gemini 66 rallies); recall-vs-Gemini**
0.85, precision-vs-Gemini 0.41** (IoU0.3) ? the high-recall/low-precision signature, now on
FRESH 19-June footage. ****>7s counts close (L16/G13) BUT agreement LOW (only 5 match; long-rally**
precision 0.31/recall 0.38)** ? local's long windows are ****over-merges/over-extensions**** that
don't 1:1 map to Gemini's clean long rallies (e.g. GX010145 has a 43s blob = degenerate merge).
? confirms gap-closure ****G2 (over-fire, mostly short) + G3 (rally-END over-extension/merge)****. ?
L-only ? all FP (could be Gemini-misses) ? ****owner golden-labels 142/143/145 next ? REAL**

accuracy** (these become gap-closure §3 golden rows). Not committed to gap-closure doc yet (un-golden = agreement, not truth; [[eval-dual-set-regression]] D3). [[paper-coauthor-aim]]
[[working-agreement-merging]]
46
47
48 ---
49 **Older checkpoints (2026-06-06 ? 2026-06-18, 96 blocks) ? [[current-state-archive]].**
Split out 2026-06-19 so this file stays read-first. Don't re-stack history here ? prepend aged-out checkpoints to the archive.
50

4. assistant (2026-06-20T07:56:44.742Z)

Let me read the durable record and pull the khelsutra repo (per the freshness convention).

5. user (2026-06-20T07:56:46.185Z)

1 ---
2 name: khelsutra-domain-launch
3 description: "Owner bought khelsutra.guru (3-yr reg, ~2026-06) and wants a real landing
page + a product/launch push (UI, desktop app, domain) alongside the eng/quality moat."
4 metadata:
5 node_type: memory
6 type: project
7 originSessionId: 8d4866bf-8edd-4da9-909e-022ddee12675
8 ---
9
10 Owner purchased **khelsutra.guru** for **3 years** (~2026-06-19) and wants to replace
the registrar's "dumb" parking page with **good HTML / a real landing page**. This marks a
deliberate pivot of attention toward **product & launch** ? domain/landing page, the UI-alpha
web app (`docs/UI\_ALPHA\_EXECUTION\_PLAN.md`), and the cross-platform desktop app
(`docs/DESKTOP\_APP\_PLAN.md`) ? run **in parallel** with the engineering/quality moat (owned
model + corpus + rally detection), not instead of it.
11
12 **Brand facts (for the landing page):** product = **KhelSutra**, domain
khelsutra.guru, brand ratified in ADR-009; reels already carry a "Generated by
Khelsutra.guru" mark. The app itself is **invite-only / private / local-first** ? so the PUBLIC
page is marketing + an honest "invite-only alpha" status + a "request access" CTA, NOT the app.
Best source copy = `docs/KHELSUTRA\_PRODUCT\_OVERVIEW.md` (what it does today, who it's for, the
"gets sharper from real footage" angle, honest "not-today" caveats).
13
14 **Why:** the owner is "ramping up on the design/product mindset" and wants active items
+ a prioritized pending list, with launch surface (domain) as a near-term quick win.
15
16 **How to apply:** treat the landing page as a Tier-0 quick win (static single-page site,
Cloudflare Pages ? domain is at **GoDaddy**, move NS to Cloudflare; CTA = email
`hello@khelsutra.guru` via Cloudflare Email Routing). Keep app + landing-page concerns separate
(private app stays gated).
17
18 **Positioning anchor (2026-06-20):** the landing page is now centered on the
searchable rally index + conversational reel composition use case ? index every rally, strip
the dead time, then build any reel from a plain-English query ("a reel of every rally over 10
seconds"). Owner's PMF instinct; my read = PMF lives in the **rally index** (the moat is
segmentation quality, which they already persist as candidate segments), with natural language
as the delightful *interface*, not the moat. Scope queries honestly to today's metadata ?
length / count / order / which game ; shot-type & player queries are roadmap (need
shot/player detection). Ties [[monetization-plan]] · [[candidate-segments-finetuning]] ·
[[current-state]].
19
20 **LIVE (2026-06-20):** khelsutra.guru is up ? landing page + `/capture` checklist + OG
image, served by **Cloudflare** (Workers static-assets, **direct upload** ; custom domain + `www`
+ free SSL; cert covers apex + `\*.khelsutra.guru`). Source is checked into the **`khelsutra`
repo under `site/`** (PR #1 merged) ? NOT the indexer repo, and NOT under `web/` (that's
earmarked for the React SPA). **Git auto-deploy intentionally NOT connected** ? to publish
changes, re-upload `site/` in the Cloudflare dashboard. Default Worker URL `hidden-king-

khelsutra.avi-dullu.workers.dev`. Cloudflare **Email Routing** for `hello@` is set up + verified working (real test). Optional still: **Always-Use-HTTPS / HSTS** toggles (http currently serves without forcing https).

21

22 **Request-Access form + backend BUILT (2026-06-20, PRs #2 + #3, tests green):** the `mailto` CTA ? a **segmented form** (academy / individual + **GPU question** + **storage question** + free text + consent), backed by a **Cloudflare Worker + D1** (`site/src/index.js` ? `POST /api/request-access` ? `access\_requests`; 10 `node --test` unit tests). The GPU/storage answers are the **BYO-compute / BYO-storage** demand signals. Repo restructured: `site/public/` (assets) + `site/src/` (worker+tests) + `wrangler.toml` + `schema.sql`. Tracked in `khelsutra/docs/REQUEST\_ACCESS\_FORM.md` + `khelsutra/NEXT\_STEPS.md`. **DEPLOYED + LIVE (2026-06-20)** via **git-connected Cloudflare Workers Builds** (repo `avidullu/khelsutra`, root dir `site/`, production branch `master`). The Worker is **hidden-king-khelsutra** ? the original dashboard-created Worker that owns khelsutra.guru; git connected straight to it (so NO domain cutover was needed), and `site/wrangler.toml` `name` was set to match it (PR #5). D1 `database\_id = cd02c6bf-4bd6-4a33-a333-ced86e36b511` bound as `DB`; database `khelsutra-access`, table `access\_requests`. **Merge to `master` ? auto-deploys** (verified: the name-fix commit self-deployed in ~12s). End-to-end verified on the live domain: form live, `POST /api/request-access` ? 200 + a real D1 row, `GET` ? 405, bad email ? 400. Deploy gotcha for next time: the wrangler `name` MUST match the connected Worker or builds miss the live site. Pending niceties: Always-Use-HTTPS/HSTS toggle; delete any orphan `khelsutra-site` Worker; the deferred runtime-portability store seam (decouple D1 for a possible always-on VM host ? `handleRequest` already takes a runtime-agnostic shape).

23

24 **PORTABILITY PROVEN LIVE (2026-06-20, PR #6):** the site/form now runs on **BOTH** Cloudflare (Worker + D1) and a dependency-free **Node + SQLite** host (`site/server.js` via `node:sqlite`) ? adapters in `site/src/store.js` (`d1Store` / `sqliteStore`), `handleRequest(request, store)` by injection; 12 `node --test` incl. a real sqlite round-trip; `khelsutra/docs/PORTABILITY.md` = the VM runbook. **Deployed + round-trip-verified** on the owner's DigitalOcean droplet (`root@168.144.126.176`, host `claude-do-rally-test`, Ubuntu 24.04) in isolated `srv/khelsutra-site/` (self-contained Node 26 binary + scp'd `site/`, port 8787): form served + POST persisted to SQLite, test server then stopped (nothing left running/exposed). ? The droplet is a **SHARED storage testbed** ? another session runs **MinIO (9000/9001)** + a **GCS emulator (9023)** + `/root/do\_gcs\_`; stay clear of those ports/dirs. SSH via dedicated key **~/.ssh/khelsutra_droplet** (revocable: delete its line from the droplet's `~/.ssh/authorized\_keys`). Fallback copy kept at `srv/khelsutra-site` (Node 26 binary + `site/`), nothing running/exposed.

25

26 **Both-hosts compatibility now ENFORCED in CI (PR #7):** `khelsutra/.github/workflows/test.yml` runs `npm test` on every push/PR (Node 24) ? **17 green** (12 Cloudflare-logic in `src/index.test.js` + 5 VM-host in `src/server.test.js`, which boots the real `server.js`). CI confirmed green on master. Live VM check: `SSH\_TARGET=root@host site/scripts/droplet-smoke.sh` (scp + boot + round-trip; PASSED on the droplet). So any change that breaks either host fails CI.

27

28 **SESSION WRAP (2026-06-20)** ? all merged (PRs #1?#8), repo clean, no open PRs. **Email-on-registration LIVE + VERIFIED**: a live submission delivered a structured summary to `avi.dullu@gmail.com`'s inbox via the Email Routing **send_email binding** (`site/src/notify.js` `cfEmailNotify`; VM path `noopNotify`; best-effort; `[send\_email]` + `NOTIFY\_FROM/TO` vars in `wrangler.toml`). **Droplet now a persistent, publicly-browsable service** ? **http://168.144.126.176:8787** (systemd unit `khelsutra-site`, ufw 8787 open). **Owner product ideas captured for next session**: (1) a **marketing video** (Grok/Gemini image-gen, themed for **serious enthusiasts**, showing the record?reel flow) embedded on the site; (2) **interactive per-rally selection** ? the engine detects rallies ? a UI lets the user **pick which rallies go into the highlight** (dynamic, NOT a fixed setting; pairs with the "ask for a reel" conversational reel-builder). Remaining nits: droplet TLS/subdomain, VM-path SMTP, Always-Use-HTTPS/HSTS, Web-Analytics token, `/capture` footer link, delete any orphan `khelsutra-site` Worker, clean CF D1 test rows.

29

6. user (2026-06-20T07:56:50.207Z)

master...origin/master

0f555ad fix: deterministic LF line endings + live-parity check (droplet vs Cloudflare drift)

```
(#10)
2c5159d docs: refresh NEXT_STEPS to shipped state + capture new product ideas (#9)
8591ee3 feat(site): email-on-registration via Email Routing send binding (best-effort, portable)
(#8)
939f966 test(site): bake in the both-hosts test harness (Cloudflare + droplet/Node) (#7)
8c607eb feat(site): portable host ? runtime-agnostic store adapter + Node/SQLite server (#6)
a1c0d89 fix(site): match wrangler name to the git-connected Worker (hidden-king-khelsutra) (#5)
a45e4af chore(site): wire D1 database_id (khelsutra-access) for the deploy binding (#4)
f699847 feat(site): Request-Access Worker + D1 backend (+ 10 unit tests) (#3)
```

7. assistant (2026-06-20T07:56:56.995Z)

Repo is clean and in sync (master at #10). Let me read the current NEXT_STEPS and the product/structure docs.

8. user (2026-06-20T07:57:02.315Z)

```
1      # Next steps (live) ? KhelSutra brand / site
2
3      Prioritized "what to do next" for the ``khelsutra` product repo``. Refresh at each
4      checkpoint.
5
6      **Where we are (2026-06-20):** `khelsutra.guru` is **LIVE and fully shipped** ? landing
7      page + `/capture`
8      checklist + OG image + a **segmented Request-Access form** (academy/individual + GPU +
9      storage + free
10     text). On **Cloudflare** (Worker `hidden-king-khelsutra` + D1 `khelsutra-access`): the
11     form persists to
12     D1 **and emails a summary to the owner on every registration** (Email Routing send
13     binding ? verified
14     live). **Git auto-deploy is connected** (Workers Builds, root `site/`): merge to
15     `master` ? deploys;
16     **CI runs `npm test` (20 green) on every PR**. The same form also runs on a dependency-
17     free **Node +
18     SQLite** host (`site/server.js`), **live + browsable on the D0 droplet ?
19     http://168.144.126.176:8787**
20     (systemd `khelsutra-site`). PRs #1?#8 merged. Docs: `docs/REQUEST_ACCESS_FORM.md`,
21     `docs/PORTABILITY.md`.
22
23     ## Next product threads (owner ideas, 2026-06-20)
24     - **Marketing video on the site** ? use Grok/Gemini image-generation to make a short
25     video (themed for
26     **serious enthusiasts**) walking the whole record ? index ? reel process, and **embed
27     it** on the
28     landing page. Design-first (storyboard + tone), then produce + embed.
29     - **Interactive per-rally selection** (big product feature) ? the engine detects
30     rallies; present them
31     in a UI so the user **picks which rallies go into the highlight** ? dynamic per-video,
32     **not a fixed
33     threshold/setting**. Pairs with the "ask for a reel" conversational builder already
34     teased on the
35     site. Lives in the alpha SPA (`web/`) over the rally index the engine produces
36     (persisted candidate
37     segments). Needs a tracked design doc.
38
39     ## Queued (site polish)
40     - **Always-Use-HTTPS + HSTS** (Cloudflare SSL/TLS) ? closes the plain-HTTP flag.
41     - **Cloudflare Web Analytics** ? paste the token into `site/public/index.html` (or
42     enable auto-setup).
43     - **`/capture` footer link** ? currently `/capture.html` (307?`/capture`); change to
44     `/capture`.
45     - **Droplet ? production** ? TLS + a subdomain (`vm.khelsutra.guru` via Caddy) if it
46     should be a real
47     standby; add **VM-path SMTP** so the Node host also emails (currently `noopNotify`).
48     - **DMARC** TXT for deliverability; delete any orphan `khelsutra-site` Worker; clean CF
```

```

D1 test rows
31      (`deploy-test@`, `email-test@`). Revoke the droplet SSH key
(`~/ssh/khelsutra_droplet`) when done.
32
33      ## Bigger arcs (design-first)
34      - **Alpha SPA** in `web/` (Vite + React + TS + Tailwind) ? hosts the per-rally selection
UI above.
35      - **BYO-storage + autosync** ? connect Drive/OneDrive/GCS/S3, watch the folder, auto-
prepare reels
36      (engine `PLATFORM_ARCHITECTURE.md S3`). The form's GPU/storage answers are the demand
signal.
37      - **Control plane** (`control-plane/`) at beta.
38
39      ## Convention
40      Substantial work gets a tracked doc in `docs/`; one PR per item off `origin/master`;
merge to `master`
41      auto-deploys (CI must be green).
42

```

9. user (2026-06-20T07:57:03.848Z)

10. assistant (2026-06-20T07:57:26.840Z)

Let me ground myself in the current site, the SPA scaffold, and the engine's positioning before designing.

11. user (2026-06-20T07:57:27.428Z)

```

1      SPA scaffold lands here at execution-plan milestone M1 (Vite + React + TS + Tailwind).
2      Dev: talks to the engine at http://localhost:8000 via Vite proxy; no auth locally
(DEV_USER_EMAIL).
3

```

12. user (2026-06-20T07:57:27.857Z)

```

1      Canonical planning docs currently live in the engine repo (`badminton-highlight-
indexer/docs`):
2      `UI_PROPOSAL.md` · `HOSTING_PLAN.md` · `UI_ALPHA_EXECUTION_PLAN.md`. They migrate here

```

when the
3 control plane lands (per ADR-009 in the engine repo's
`docs/archives/decisions/DECISIONS.md`).
4

13. user (2026-06-20T07:57:28.678Z)

418     <div class="wrap">
419         <div class="sec-head">
420             <div class="kicker">Quick answers</div>
421             <h2>Common questions</h2>
422         </div>
423         <div style="margin-top:1.6rem">
424             <details><summary>How accurate is it?</summary><p>Very good on a clean, single-
court recording. A busy multi-court hall is harder ? and is exactly what we're improving. The
best answer is to show you a sample reel of your own court rather than quote a
number.</p></details>
425             <details><summary>Can I choose which rallies go in the reel?</summary><p>Today
your reel includes the rallies KhelSutra found, with the dead time removed. Choosing by length,
count, order or which game ? just by asking in plain English ? is rolling out to alpha users
next; shot-type and player queries follow as the deeper analysis arrives.</p></details>
426             <details><summary>Do I need a special camera or hardware?</summary><p>No. A phone
or GoPro on a tripod, behind the court, whole court in frame. We provide a one-page capture
checklist at setup.</p></details>
427             <details><summary>Is my video private? What happens to it?</summary><p>We treat
your footage as private: we never publish it, and we never use it to improve the tool without
your explicit opt-in. These are large videos that need real processing, so your video is handled
securely on our infrastructure to make your reel. Footage involving minors is never used and
never published.</p></details>
428             <details><summary>Does it work for doubles and tournaments?</summary><p>It finds
rallies in doubles too. Tournament footage varies ? a clean, fixed, full-court recording works
well; crowded multi-court tournament halls are the hard case we're specifically working
on.</p></details>
429             <details><summary>Which sports?</summary><p>Badminton today. Table tennis and
other racket sports are on the roadmap.</p></details>
430             <details><summary>How do I join?</summary><p>It's an invite-only private trial.
The best next step is to let us record a session and show you your own court and players as a
reel. Email <a href="mailto:hello@khelsutra.guru">hello@khelsutra.guru</a>.</p></details>

Now let me quickly confirm what engine-side docs and API surface actually exist so the research agents target real files (grounding matters ? the doc must reflect real contracts, not aspirational ones).

Found 2 files
backend\main.py
backend\api\uploads.py

17. assistant (2026-06-20T07:59:11.787Z)

Repo confirmed: engine has a FastAPI app (`backend/main.py`, `backend/api/uploads.py`), all the UI/hosting/product docs, and the `PROJECT\_DOC\_TEMPLATE.md`. I have enough to scope a grounded design. Since ultracode is on, I'll run a Workflow: fan out readers to map the real engine data contract + API + UI plans, then a design panel proposes independent approaches and a synthesis consolidates them. I write the doc from verified findings.

18. user (2026-06-20T07:59:12.855Z)

Chapter marked: "Per-rally selection design". Continue your current work.

19. user (2026-06-20T08:00:25.301Z)

Workflow launched in background. Task ID: wuyb5jgd9
Summary: Research the engine rally-index contract + API + UI plans, then design the interactive per-rally selection feature; return a grounded design synthesis.
Transcript dir: C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\144a31b7-7962-4fee-9d6f-8a7854daa63f\subagents\workflows\wf_1c5f1f5c-9ba
Script file: C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\144a31b7-7962-4fee-9d6f-8a7854daa63f\workflows\scripts\khelsutra-per-rally-design-wf_1c5f1f5c-9ba.js
(Edit this file with Write/Edit and re-invoke Workflow with {scriptPath: "C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\144a31b7-7962-4fee-9d6f-8a7854daa63f\workflows\scripts\khelsutra-per-rally-design-wf_1c5f1f5c-9ba.js"} to iterate without resending the script.)
Run ID: wf_1c5f1f5c-9ba
To resume after editing the script: Workflow({scriptPath: "C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\144a31b7-7962-4fee-9d6f-8a7854daa63f\workflows\scripts\khelsutra-per-rally-design-wf_1c5f1f5c-9ba.js", resumeFromRunId: "wf_1c5f1f5c-9ba"}) ? completed agents return cached results.

You will be notified when it completes. Use /workflows to watch live progress.

20. assistant (2026-06-20T08:00:32.272Z)

The workflow is running in the background. While it works, I'll independently read the key engine files so I can verify the agents' claims when results return (grounding matters ? the doc must reflect real contracts).

22. assistant (2026-06-20T08:01:03.473Z)

I've ramped up and kicked off the design research. Here's where things stand.

Ramp-up (current, verified)

```
- **khelsutra repo**: clean, `master` in sync at #10 (parity-check). Site is live (Cloudflare Worker `hidden-king-khelsutra` + D1; merge?auto-deploy; CI `npm test`=20 green). Portable Node+SQLite twin live on the droplet `:8787`. ? Droplet shared testbed ? staying clear of ports 9000/9001/9023 and `/root`.
- **The task**: thread #1 ? **interactive per-rally selection** (engine detects rallies ? UI to pick which go in the reel; pairs with the "ask for a reel" conversational builder already teased in the site's `#ask` section). Convention says: **tracked design doc first, before building.**
```

Key grounding I already confirmed in the engine

```
Reading [backend/main.py](C:\Users\avidu\Projects\badminton-highlight-indexer\backend\main.py),
the engine **already exposes the core selection primitive**:
- `POST /api/query` ? list a video's play-segments (`id`, `start_time`, `end_time`, `metadata`)
- `POST /api/compile` ? takes `{video_id, segment_ids[], output_filename}` and stitches
**exactly the chosen segments** into one MP4
- `GET /api/highlights/{video_id}/{filename}` ? download the reel
```

So "pick rallies ? build reel" maps cleanly onto `query` ? user selects `segment\_ids` ? `compile` ? `download`. The likely **gaps** are per-rally thumbnails/preview and in-browser proxy playback ? the design will pin these down precisely.

Running now (background Workflow `wuyb5jgd9`)

A multi-agent design pass:

1. **Understand** ? 4 readers mapping the real data contract, full API surface + auth, the SPA/conversational-builder plans, and the exact tracked-doc template.
2. **Design** ? 3 independent approaches (timeline-first / grid-first / conversational-first).
3. **Synthesize** ? judge-score + consolidate into one grounded architecture + a doc draft.

I'll verify its findings against the source (I'm cross-checking, not trusting the descriptions), then write the tracked design doc and open it as a PR for your review ? I'll hold merge since it embeds product/scope decisions that are your call. Waiting on the workflow; I'll pick up automatically when it finishes.

23. user (2026-06-20T08:01:03.553Z)

make sure to sync the repo to remote head since another sessions are working on moving this to droplet and GPU machines

24. assistant (2026-06-20T08:01:10.594Z)

Good call ? let me re-sync the khelsutra repo to remote head right now (other sessions may have pushed since my initial fetch). Safe form only: ff-only, no force.

25. user (2026-06-20T08:01:15.892Z)

0f555ad fix: deterministic LF line endings + live-parity check (droplet vs Cloudflare drift)

```
(#10)
2c5159d docs: refresh NEXT_STEPS to shipped state + capture new product ideas (#9)
8591ee3 feat(site): email-on-registration via Email Routing send binding (best-effort, portable)
(#8)
939f966 test(site): bake in the both-hosts test harness (Cloudflare + droplet/Node) (#7)
8c607eb feat(site): portable host ? runtime-agnostic store adapter + Node/SQLite server (#6)
a1c0d89 fix(site): match wrangler name to the git-connected Worker (hidden-king-khelsutra) (#5)
a45e4af chore(site): wire D1 database_id (khelsutra-access) for the deploy binding (#4)
f699847 feat(site): Request-Access Worker + D1 backend (+ 10 unit tests) (#3)
```

26. assistant (2026-06-20T08:01:28.712Z)

khelsutra is already at remote head ? nothing to pull:

```
- **`master...origin/master` ? `0 0`** (no divergence), working tree **clean**, HEAD at
`0f555ad` (#10).
- The fetch just **pruned merged PR branches** (the `feat/*`, `fix/*`, `chore/*` from PRs
#1?#10) ? remote cleanup, harmless.
```

Since other sessions are actively writing in this shared checkout (droplet/GPU moves), I'll follow the concurrent-session protocol when I write the design doc: **cut the branch explicitly from `origin/master`** (`git checkout -b docs/per-rally-selection origin/master`), re-verify HEAD right before commit, and **stage only the doc path** ? so nothing from a sibling session can ride into my commit. The doc lands in `docs/` (not `site/`), so it won't touch the droplet/Worker deploy path either.

No conflict with the running design workflow ? it's **read-only** against the *indexer* repo. Still waiting on it; I'll continue automatically when it completes.

(length/count/order/shot_count) maps to a field the payload already returns; deterministic
parseQuery() needs no LLM, no unavailable data, no API cost. Zero new engine endpoints for MVP.
parseQuery() is the exact 'conversational seam' the owned-model plan reserves, so
shot/player/score upgrade is an adapter swap not a rewrite. Only weakness shared with the
others: no per-rally preview (no source/proxy stream)."
```

```

617     }
618 },
619     "recommended_architecture": "HYBRID, dominant surface = the selectable rally
list/grid (RallyPicker + Rally Grid fused), with a conversational query bar grafted on top as
the primary fast-entry, and a compact reel-preview footer/tray as the persistent build CTA.
Concretely: (1) Workhorse = a selectable RallyList/Grid over play_segments ? one card per rally
showing only the three honest fields (ordinal by start_time, duration, shot_count+confidence
chip), individual + bulk checkbox selection backed by one shared Set<segment_id>. (2) Fast entry
= a deterministic, client-side, unit-tested parseQuery() query bar that compiles plain English
into a {filter,sort} predicate over ONLY length/count/order/shot_count and WRITES INTO that same
selection set, with a visible 'parsed pill' readout so the interpretation is transparent and
hand-correctable. (3) Build = a sticky reel-preview footer showing live 'N clips / total M:SS',
a min_shot_count-floor warning (read from GET /api/config), reel-name input, and one Build
button -> POST /api/compile {video_id, segment_ids, output_filename}, then the SPA constructs
GET /api/highlights/{video_id}/{filename} to preview+download the single compiled MP4. The
timeline becomes a POST-MVP visual layer (RallyReel Timeline's bands) layered onto the same
selection model once a source-stream endpoint exists ? not the MVP surface, because today's
contract cannot stream source video for scrubbing. The unifying invariant across all three input
modes (query, checkbox, future timeline band) is ONE client-side selected-set + ONE compile
contract; there is never a second code path that compiles independently.",
620     "rationale": "RallyPicker wins on score (19 vs 15 vs 14) because it is the only
approach whose MVP consumes zero capabilities the engine lacks: every query dimension maps to a
field POST /api/query already returns (start_time/end_time/duration are real REAL-seconds
columns at database.py:122-135; metadata.shot_count + shot_count_confidence are the Gemini-
written fields at gemini.py:461-498), and the deterministic parser sidesteps the deferred
conversational-QA model entirely (UI_PROPOSAL.md:66) while being the exact 'conversational seam'
the owned-model plan reserves (OWNED_MODEL_IMPLEMENTATION_PLAN.md:54-55). But Rally Grid's card
grid is the right WORKHORSE for fine-tuning and scales to long matches via bulk/filter, and
RallyReel Timeline owns the best long-term visual + the strongest upgrade path to the ? corpus
engine (PATCH /api/segments, PR-4). The hybrid grafts each at its strength: query-bar as fast
pre-select (RallyPicker), grid as the editable show-your-work surface (Rally Grid),
timeline+preview deferred until a source-stream endpoint lands (RallyReel Timeline). All three
already converge on the same seam ? one selected Set<segment_id> + one POST /api/compile call ?
so fusing them costs no architectural compromise; it just sequences which input mode ships
first. Critically, the hybrid is HONEST: it ships the full pick->reel loop on verified-existing
endpoints, replacing the silent stitching.min_shot_count cut (main.py:362-383) with explicit
user selection, which is the owner's actual framing (dynamic per-video selection, not a fixed
threshold).",
621     "data_flow": "engine (Gemini segmenter at process time) writes play_segments rows
{id, start_time, end_time, duration, metadata.shot_count/shot_count_confidence/detector,
video_id} [verified database.py:122-135, gemini.py:461-498] -> SPA fetches the rally list via
the EXISTING POST /api/query {video_id} -> {play_segments:[...]} [verified main.py:331-340,
database.py:427-475] (the ONLY rally-list path today; fix the static UI's data.rallies bug to
read response.play_segments, app.js:344) -> SPA normalizes into a typed client store:
RallyCard[] {id, ordinal=start_time order, durationSec=end-start, shotCount, shotConf} plus a
single shared selectedIds:Set<number> and {filter,sort}; server/receiver/events ARE present in
the payload but are motion-only random fabrications and are NOT surfaced [verified
motion.py:191-250] -> input modes all mutate the SAME selectedIds: (a) parseQuery() compiles the
query string into {predicate,comparator} over duration/ordinal/shot_count and applies it; (b)
checkbox toggle / bulk Select-all/Clear/Invert; (c) [post-MVP] timeline band click -> selection
footer recomputes selectedCount + sum(duration) live, fully client-side, no round-trip; surfaces
a warning for any selected rally whose shotCount < stitching.min_shot_count (read from GET
/api/config) since compile silently drops it [verified main.py:362-383] -> on Build, SPA POSTs
/api/compile {video_id, segment_ids: Array.from(selectedIds), output_filename}; the stitcher de-
duplicates via _merge_overlapping so selection order is harmless [verified compiler.py:80-105], cuts
time_pairs from videos.filepath, re-encodes per clip and concats to one MP4 [verified
main.py:342-396, compiler.py:303-413] -> compile returns a server-LOCAL filepath (NOT a URL)
```

[verified main.py:394], so the SPA constructs GET /api/highlights/{video_id}/{output_filename} itself to preview in a <video> and download [verified main.py:307-328] ? the compiled reel is the ONLY streamable video that exists today.",

```

today's 'all rallies' reel) or all-OFF (curate-by-addition)? Affects the empty/footer UX. Owner product call.",

757 "IA / surface count: query bar + grid + (later) timeline + (later) A4 correction are up to four overlapping reel-building surfaces. Do we present query+grid as ONE screen (recommended) and keep A4 a separate ? corpus screen, or unify all? Owner positioning call.",

758 "Is the deterministic parseQuery() allowed to be called 'conversational' in user-facing copy, given conversational QA is explicitly deferred (UI_PROPOSAL.md:66)? Risk of over-promising NL understanding. Owner positioning/honesty call.",

759 "min_shot_count floor on the manual path: keep the server-side floor silently dropping user-selected rallies (warn in UI), or make /api/compile honor an explicit-selection override so a user's checkbox always wins? Owner product call (touches compile default behavior -> Launch Report convention applies).",

760 "Standalone entry vs job-tethered: ship MVP tethered to a finished job's video_id (no GET /api/videos), accepting users can't 'open a past match', or pull GET /api/videos + PR-3 scoping into MVP? Owner scope call.",

761 "Preview priority: is select-without-preview acceptable for alpha (text metadata only), or is a source/clip-stream endpoint a ship-blocker for the feel the owner wants? Owner scope call ? it is the single biggest backend lift."

762],

763 "risks": [

764 "No source/proxy/clip/frame/thumbnail endpoint exists today (only compiled reels stream) ? any in-page per-rally preview or timeline scrub is BLOCKED until new engine API lands; MVP can only preview the FINAL compiled reel. This is the biggest UX-vs-effort tension.",

765 "stitching.min_shot_count silently drops user-selected rallies at compile (unknown counts exempt, main.py:362-383); if the UI doesn't surface it, the reel won't match the selection and looks broken.",

766 "No match-duration field exists; a timeline must derive total = max(end_time), mis-rendering pre-first-rally and post-last-rally dead air ? a correctness risk if the timeline surface is over-promised.",

767 "shot_count is Gemini's shuttle_exchange_count with a max(3,int(dur/0.8)) fallback when absent (gemini.py:470-485) ? a 'by shot count' query is only as good as that estimate; must be honest-labeled as approximate, and shot_count_confidence is a Gemini string (often 'Unknown'), not a numeric meter.",

768 "No auth / user scoping on any endpoint (CORS '*', videos.user_id never set/filtered) ? fine for single-box local alpha, a ship-blocker for any multi-tester host; GET /api/videos without PR-3 scoping would leak other users' matches.",

769 "compile returns a server-local filepath not a URL ? client-side URL building is brittle until the additive download_url field lands.",

770 "Surface sprawl: query + grid + future timeline + future A4 correction risk confusing alpha testers without deliberate IA.",

771 "Calling the deterministic parser 'conversational' risks over-promising NL understanding the docs explicitly defer; the parsed-pill readout mitigates but copy must stay honest.",

772 "A green SPA build + passing parseQuery/selection unit tests prove the PICKER logic only ? NOT that the engine's rally boundaries are correct (the measured rally-END weakness is a separate track, unaffected by this UI)."

773],

774 "design_markdown": "# Interactive per-rally selection ? reel builder (RallyPicker)\n\n> **Status:** `DRAFT` ? owner-gated on scope (preview endpoint, multi-video entry) and any compile-default change . **Owner:** Avi . **Created:** 2026-06-20 . **Last updated:** 2026-06-20\n\n> **Lifecycle:** `DRAFT` ? IN PROGRESS ? DONE ? archived` (move to `docs/archives/` when DONE)\n\n> \*\*Tracking anchors:\*\* \$7 progress tracker is the source of truth; indexed in `docs/README.md`; pointer in memory current-state once work starts.\n\n> \*\*Relation:\*\* realizes alpha screens \*\*A4/A5\*\* (`UI_PROPOSAL.md:46-47`) and SPA milestone \*\*M3\*\* (`UI_ALPHA_EXECUTION_PLAN.md:38`); peer-of `REQUEST_ACCESS_FORM.md` in this repo; consumes the engine repo's `/api/query` + `/api/compile` contract.\n\n> \*\*Honesty note:\*\* every claim tagged `[verified]` (checked vs engine code), `[design]` (proposed), or `[researched]` (needs sign-off). Not legal advice.\n\n\n---\n\n\n## 0. TL;DR\n\nBuild the interactive \*\*pick-rallies ? reel\*\* surface as a \*\*hybrid\*\*: a selectable rally \*\*list/grid\*\* is the workhorse, a \*\*deterministic query bar\*\* (`"rallies over 10s, longest first") pre-selects into the **same** selection set, and a sticky footer compiles the selection into one downloadable MP4. The whole MVP runs on **existing** endpoints ? `POST /api/query`, `POST /api/compile`, `GET /api/highlights` `[verified main.py:331-396, 307-328]` ? with **zero new engine intelligence**. The single most important caveat: queries and chips are scoped to **length / count / order / shot_count only**; shot-type, player, and score are **roadmap-only** and must not be faked.\n\n\n## 1. Problem &

motivating example\nToday the alpha can detect rallies and stitch a fixed reel, but reel-building is either a silent `min\_shot\_count` threshold or a static checkbox list (``backend/api/static/app.js``, which also has a live bug: it reads `data.rallies` while the API returns `play\_segments` ``[verified app.js:344]``). The owner's framing is **dynamic per-video selection**, not a fixed threshold? a coach should say "give me the long rallies from this session" and get exactly those.\n\n**Motivating example:** A coach uploads a 40-minute session. The engine finds 60 rallies. They type "top 15 longest", eyeball the auto-selected cards, untick two warm-up rallies, name it "Tuesday ? long points", and download a 6-minute reel ? without learning any threshold knob.\n\n## 2. Goal & non-goals\n**Goal:** the smallest honest surface that turns engine-detected rallies into a user-curated, downloadable reel, with both fast (query) and precise (checkbox) selection sharing one state.\n**Non-goals (alpha):** no conversational LLM (``UI_PROPOSAL.md:66``); no shot-type/player/score filters (no data); no per-rally video preview if it requires unbuilt streaming; no multi-tenant auth (single-box alpha).\n\n## 3. Decisions locked\n| Decision | Choice | Why |\n|---|---|---|\n| Dominant surface | Selectable rally **list/grid** | Scales to long matches; honest fields only |\n| Fast entry | **Deterministic** client-side ``parseQuery()`` (no LLM) | Predictable, testable, offline, no API cost; conversational QA is deferred ``[verified UI_PROPOSAL.md:66]`` |\n| Selection model | **One** shared ``Set<segment_id>``, mutated by query + checkbox + (future) timeline | No second compile path can diverge |\n| Compile contract | Existing ``POST /api/compile {video_id, segment_ids, output_filename}`` ``[verified main.py:342-396]`` | Order-safe ? stitcher ``_merge_overlapping`` de-dupes ``[verified compiler.py:80-105]`` |\n| Query grammar (alpha) | length, count, order, shot_count **only** | Only fields the payload returns ``[verified database.py:122-135, gemini.py:461-498]`` |\n| MVP backend | **Zero new endpoints** | Rides verified contract |\n\n## 4. Design / architecture\n**Reuse map (existing, ``[verified]``):** ``POST /api/query`` (rally list) ? ``POST /api/compile`` (stitch) ? ``GET /api/highlights/{video_id}/{filename}`` (download); ``GET /api/config`` for the ``stitching.min_shot_count`` floor; ``GET /api/jobs/{id}`` to carry ``result.video_id`` into the picker. New code is the **SPA** (``khelsutra`` ``web/``) + a small set of real-gap backend enablers (\$4.2).\n\n**4.1 Components (net-new SPA):** ``n-`` ``QueryBar + parseQuery()`` ? pure, deterministic, unit-tested string ? ``{filter, sort}`` over duration / ordinal / shot_count; renders a **parsed-pill** (``("filter: duration>10s · sort: duration desc")``) so the interpretation is transparent and editable; greys out shot-type/player/score tokens with "not available yet".\n\n**RallyList/Grid** ? one card per ``play_segment``: ordinal (by ``start_time``), ``mm:ss`` start, duration (``end-start``), shot_count + confidence chip (only when ``metadata.shot_count`` present). Checkbox per card; thumbnail slot is a placeholder (no endpoint).\n\n**useRallySelection()** hook ? owns ``selectedIds:Set``, ``displayOrder``, ``apply(queryResult)``, ``toggle(id)``, bulk Select-all/Clear/Invert; unit-tested (the M4 "review-state logic" bar).\n\n**SelectionFooter (sticky)** ? live "N clips / total M:SS"; **min_shot_count warning** when a selected rally would be dropped; reel-name input; Build button.\n\n**CompileResult** ? ``<video src=GET /api/highlights/...>`` preview of the compiled reel + download link.\n\n**TypedApiClient** ? ``query``, ``compile``, ``buildDownloadUrl``; the M1 client deliverable.\n\n**4.2 API additions (tagged against real gaps ? see \$4.3 data flow):** detailed in the api list; MVP needs **none**.\n\n**4.3 Data flow:** Gemini ? ``play_segments {id, start/end_time, duration, metadata.shot_count/confidence}`` ``[verified gemini.py:461-498]`` ? SPA ``POST /api/query {video_id}`` ? normalize to ``RallyCard[]`` + one ``selectedIds`` ? query/checkbox both mutate ``selectedIds`` ? footer recomputes client-side ? Build ? ``POST /api/compile`` (cuts ``time_pairs`` from ``videos.filepath``, re-encodes per clip, concatenates ``[verified main.py:386-393, compiler.py:303-413]``) ? returns a **server-local filepath**, not a URL ``[verified main.py:394]`` ? SPA builds ``GET /api/highlights/{video_id}/{filename}`` to preview + download.\n\n**Dead-ends / do-NOT:** do not surface ``server/receiver/events`` ? they are motion-only **random fabrications** ``[verified motion.py:191-250]``. Do not consume shot_type/player/score ? no column, no detector. Do not render a confidence **meter** ? ``shot_count_confidence`` is a Gemini string (often "Unknown"), and ``play_segments`` has **no** confidence column.\n\n## 5. Risks & limits\nThe biggest tension is **preview**: only compiled reels stream today ``[verified main.py:307-328]``, so per-rally preview/scrub is blocked until a source/clip endpoint lands; MVP previews the **final** reel only. The ``min_shot_count`` floor silently drops selected rallies ``[verified main.py:362-383]`` ? the UI must warn, not hide. A timeline must derive ``total = max(end_time)`` (no match-duration field), mis-rendering dead air ? hence the timeline is deferred to M3. ``shot_count`` is ``shuttle_exchange_count`` with a ``max(3,int(dur/0.8))`` fallback ``[verified gemini.py:470-485]`` ? label it approximate. No auth/scoping exists ? fine for single-box alpha, a ship-blocker for multi-tenant.\n\n## 6. Honest limits ? what this does NOT do\nA green SPA build + passing ``parseQuery``/selection unit tests prove the **picker logic only** ? NOT that the engine's rally boundaries are correct (the measured **rally-END** weakness is a separate quality track, unaffected by this UI). "Conversational" here means a deterministic four-dimension parser, **not** NL understanding. This is ``[design]`` ? nothing is implemented in

```

`web/` yet.\n\n## 7. Deliverables & progress tracker ? source of truth\nLegend: ? Todo . ? In
progress . ? Done . ? Blocked/gated. One small PR per row, branched from `origin/master`, no
stacking. Update the row (status + PR) as work lands.\n| ID | Deliverable | Depends on | Gated?

owner / external\n\n**Blocking gates:** (1) Default selection ON vs OFF? (2) Is preview-before-
select a ship-blocker, or is text-metadata selection acceptable for alpha? (3) MVP job-tethered
(no `GET /api/videos`) vs pull multi-video + PR-3 scoping into MVP? (4) `min_shot_count`: keep
silent floor (warn) or let an explicit checkbox override it (touches compile default ? **Launch
Report** convention)?\n\n**Nice-to-knows:** Can we call `parseQuery()` `\"conversational\"` in copy?
One screen for query+grid vs separate A4 corpus screen?\n\n## 9. Definition of done\n- [ ] From
a finished job, a user can list rallies, query/select, and download a reel ? on existing
endpoints.\n- [ ] Only honest fields (ordinal/duration/shot_count+confidence) are shown;
fabricated fields hidden.\n- [ ] `parseQuery()` covers length/count/order/shot_count, greys out
unavailable tokens, has a visible parsed-pill, and is unit-tested.\n- [ ] Selection hook unit-
tested; `min_shot_count` floor surfaced, not hidden.\n- [ ] `npm run build` clean; the
`data.rallies` bug is gone.\n- [ ] Tracker + DoD updated; archived when P1?P5 land.\n\n## 10.

33. assistant (2026-06-20T08:08:53.187Z)

Outstanding, deeply-grounded synthesis. Before I commit any of it to a doc, the attribution working agreement requires me to **verify the load-bearing claims** myself ? I won't assert a bug or a contract I haven't seen. Let me verify the highest-stakes ones (the `app.js` bug, the segment schema, the "fabricated fields" warning, the shot_count fallback, the de-dupe claim, and the "conversational deferred" doc anchor).

41. assistant (2026-06-20T08:09:37.933Z)

All verified. `motion.py:191-198` does fabricate `server/receiver` (`random.sample`) and a random `shot\_count`; `gemini.py:470-485` derives `shot\_count` from `shuttle\_exchange\_count` with the `max(3,int(dur/0.8))` fallback and stores `server/receiver=None` ("no fabricated data"); `UI\_PROPOSAL.md:46-47,66` and `HOSTING\_PLAN.md:42` match (minor line drift: health ping is `:42`). One nuance to nail down ? which segmenter is the ****default****, since that decides whether `shot\_count` is honest:

42. user (2026-06-20T08:09:39.928Z)

```
backend\config\models.py-117-class IndexingConfig(BaseModel):
backend\config\models.py:118:     default_segementer: str = "yolo_hybrid"
backend\config\models.py-119-     use_gpu: bool = True
--
C:\Users\avidu\Projects\badminton-highlight-indexer\backend\config\models.py-193-
backend\config\models.py:194:     @field_validator("default_segementer")

@classmethod
```

43. user (2026-06-20T08:09:40.797Z)

```
},
"indexing": {
    "default_segementer": "gemini",
    "use_gpu": true,
    "motion_threshold": 0.08,
```

44. assistant (2026-06-20T08:10:07.871Z)

Confirmed: `config.json` sets `default\_segementer: "gemini"` (the production path), so `shot\_count` is Gemini's real-ish estimate and `server/receiver` are `None` on that path ? the synthesis's honesty framing holds. All load-bearing claims verified against source.

Let me check the exact tracked-doc template and the khelsutra house voice so my doc matches both conventions.

45. user (2026-06-20T08:10:08.822Z)

```

1      <!--
2      PROJECT DOC TEMPLATE ? copy this file to docs/<YOUR_PLAN>.md and fill it in.
3
4      A "tracked project doc" is how this repo carries substantial design/project work: it can
be
5      ITERATED on, its progress TRACKED, and it is MARKED DONE against explicit deliverables,
then
6      archived. Standardizes the emergent pattern in docs/RALLY_QUALITY_RESEARCH.md §7 and
7      docs/GOLDEN_REGRESSION_FIXTURES.md.
8
9      Rules of thumb:
10     - §7 (the progress tracker) is the SOURCE OF TRUTH ? one row per independently-shippable
PR.
11     - Keep it HONEST: tag each claim [verified] (checked against code), [researched] (needs
sign-off),
12       or [design] (proposed). The doc reflects real shipped state, never aspirational.
13     - It POINTS to detail (code anchors, research artifacts), it does not duplicate it.
14     - Sections marked OPTIONAL are included only when relevant (e.g. Foundation/Threat-model
for
15       research- or security/privacy-heavy work). Delete sections that do not apply.
16     - Move to docs/archives/ once Status = DONE (per the archive policy: only terminal-state
work).
17     -->
18
19     # <Project / Plan Title>
20
21     > **Status:** `DRAFT` ? `<owner-gated? | in progress>` . **Owner:** `<name>` .

12    > ComputeBackend) and `VIDEO_LOCALITY_MODEL.md` ? see $7.
13
14    ---
15
16    ## 0. TL;DR
17    Replace the landing page's `mailto:` "Request access" CTA with a real form that (a)
18    segments
19    **academies vs individual enthusiasts**, (b) asks the two questions that actually decide
20    how we'd
21    serve a user ? ***"do you have a GPU machine?"** (compute placement) and ***"where do your
22    videos
23    live?"** (storage backend) ? and (c) keeps a free-text message. Submissions are stored
24    in our own
25    **Cloudflare D1** via a small **Worker** (`POST /api/request-access`). The form doubles
26    as PMF +
27    architecture research.
28
29    ## 1. Problem & goal
30    Today the CTA is `mailto:hello@khelsutra.guru` ? zero structure, nothing collected, no
31    segmentation.
32    We want **structured, queryable** interest signals from two distinct audiences, captured
33    the moment

```

47. assistant (2026-06-20T08:10:37.676Z)

The synthesis draft matches the template cleanly, and the khelsutra house style mirrors it. Let me verify the last two anchors I'll cite precisely (the compiler entrypoint and the query read path), then I'll write the doc.

48. user (2026-06-20T08:10:39.399Z)

476

```

50. assistant (2026-06-20T08:10:50.586Z)

Both verified: `compile\_highlights(raw\_video\_path, segments:[(start,end)], output\_filename)` calls `\_merge\_overlapping` (de-dupe ? selection-order-safe), and `query\_play\_segments` returns `play\_segments` rows with `metadata` parsed + `events` joined (filters: duration_min/server/receiver/event_type). **Every load-bearing claim is now personally verified against source.**

Now I'll write the doc. First, cut the branch explicitly from `origin/master` (concurrent-session safety).

51. user (2026-06-20T08:10:54.638Z)

```

branch 'docs/per-rally-selection' set up to track 'origin/master'.

(#10)

```

52. assistant (2026-06-20T08:11:03.871Z)

On the new branch off `origin/master` (#10). Now I'll write the design doc ? adapting the verified synthesis into the canonical template structure, with my corrections (A5/M4 vs A4/M3 cross-refs, `HOSTING\_PLAN:42`, and the `shot\_count` honesty nuance now that I've confirmed `default\_segmenter: gemini`).

53. assistant (2026-06-20T08:12:41.369Z)

Interactive per-rally selection ? reel builder (RallyPicker)

```

> **Status:** `DRAFT` ? owner-gated (scope: preview endpoint, multi-video entry; and any
`/api/compile` default change) . **Owner:** Avi . **Created:** 2026-06-20 . **Last updated:**

```

2026-06-20

```
> **Lifecycle:** `DRAFT ? IN PROGRESS ? DONE ? archived` (move to `docs/archives/` when DONE)
> **Tracking anchors:** S7 progress tracker is the source of truth; indexed in `docs/README.md`;
pointer in `NEXT_STEPS.md` + memory `current-state` once work starts.
> **Relation:** second major tracked work item in the `khelesutra` repo (peer of
`REQUEST_ACCESS_FORM.md`); mirrors the engine repo's `PROJECT_DOC_TEMPLATE` discipline.
Primarily realizes alpha screen **A5 Highlights** (engine repo `UI_PROPOSAL.md:47`, exec-plan
**M4** `UI_ALPHA_EXECUTION_PLAN.md:39`); its correction-loop extension realizes **A4 Rally
Review** (`UI_PROPOSAL.md:46`, exec-plan **M3** `:38`). Consumes the engine's `/api/query` +
`/api/compile` contract.
> **Honesty note:** every engine-fact claim is tagged `[verified]` (read against engine code
this session), `[design]` (proposed here), or `[researched]` (needs sign-off). Not
legal/financial advice.
```

0. TL;DR

Build the ****pick-rallies ? reel**** surface as a ****hybrid****: a selectable rally ****list/grid**** is the workhorse; a ****deterministic query bar**** ("rallies over 10s, longest first") pre-selects into the ****same**** selection set; a sticky footer compiles the selection into one downloadable MP4. The entire MVP runs on ****existing engine endpoints**** ? `POST /api/query` ? `POST /api/compile` ? `GET /api/highlights` `[verified backend/main.py:331-340, 342-396, 307-328]` ? with ****zero new engine intelligence and zero new endpoints****. The single most important caveat: queries and chips are scoped to ****length / count / order / shot-count only****; shot-type, player, and score are ****roadmap-only**** (no detector, no column) and must not be faked. The biggest UX-vs-effort tension: ****no per-rally preview is possible today**** ? only the ***final compiled reel*** can stream ? so MVP selects on text metadata, and visual preview/timeline is a deliberate later milestone.

1. Problem & goal

Today the alpha can detect rallies and stitch a reel, but reel-building is either a ****silent `stitching.min\_shot\_count` threshold**** `[verified backend/main.py:362-383]` or a static checkbox list whose data plumbing is even broken ? the bundled static UI reads `data.rallies` while the API returns `play\_segments`, so it renders nothing `[verified backend/api/static/app.js:344 vs backend/main.py:340]`. The owner's framing is ****dynamic per-video selection, not a fixed threshold****: a coach should say "give me the long rallies from this session" and get exactly those, then fine-tune by hand.

****The concrete outcome ("good")****: A coach uploads a 40-minute session; the engine finds 60 rallies. They type ****"top 15 longest"**, eyeball the auto-selected cards, untick two warm-up rallies, name it "Tuesday ? long points"**, and download a ~6-minute reel ? without learning any threshold knob.**

****Goal****: the smallest ***honest*** surface that turns engine-detected rallies into a user-curated, downloadable reel, with both ****fast**** (query) and ****precise**** (checkbox) selection sharing ****one**** state.

****Non-goals (alpha)****: no conversational LLM (`UI\_PROPOSAL.md:66` defers it); no shot-type/player/score filters (no data exists); no per-rally video preview while it requires unbuilt streaming; no multi-tenant auth (single-box alpha).

2. Decisions locked

#	Decision	Source / date	Implication
D1	Dominant surface = selectable rally **list/grid**	Synthesis 2026-06-20 (Grid scored 15, fit-to-data 4)	Scales to long matches via bulk+filter; shows honest fields only
D2	Fast entry = **deterministic** client-side `parseQuery()` (no LLM)	[verified UI_PROPOSAL.md:66]	conversational QA deferred Predictable, unit-testable, offline, zero API cost
D3	**One** shared `Set<segment_id>`, mutated by query + checkbox + (future) timeline	Synthesis 2026-06-20	No second compile path can diverge from what the user sees
D4	Compile via existing `POST /api/compile {video_id, segment_ids, output_filename}`	[verified backend/main.py:342-396]	Selection order is harmless ? stitcher `_merge_overlapping` de-dupes [verified compiler.py:80-105, 311-317]

```
| D5 | Query grammar (alpha) = length, count, order, **shot_count only** | `[verified
database.py:122-135, gemini.py:470-485]` | Only fields the payload actually returns; grey out
the rest |
| D6 | MVP backend = **zero new endpoints** | `[verified]` reuse map ($4) | Ships the full loop
on the already-shipped contract |
| D7 | Replace the silent `min_shot_count` cut with **explicit user selection** | Owner framing
+ `[verified main.py:362-383]` | UI *warns* about the floor; it never hides why a rally vanished
|
```

3. Foundation ? what the engine gives us today `[verified this session]`

The whole design rests on the engine's real, already-shipped contract. Read against the engine repo (`badminton-highlight-indexer`):

```
- **The rally store is `play_segments`** ? columns `id, video_id, start_time, end_time,
duration, server, receiver, metadata` `[verified database.py:124-135]`. `id` is the integer the
UI selects and passes to compile; `start_time/end_time/duration` are REAL seconds (duration
computed at insert).
- **Listing rallies = `POST /api/query {video_id}` ? `{play_segments:[...]}`** ? the *only*
rally-list path today; it JSON-parses `metadata` and joins `events` `[verified main.py:331-340,
database.py:427-475]`.
- **Building a reel = `POST /api/compile {video_id, segment_ids:[int], output_filename}`** ?
loads `videos.filepath`, filters all segments to the requested `segment_ids`, applies the
`min_shot_count` floor, extracts `time_pairs=[(start,end)]`, and calls
`VideoCompiler.compile_highlights(raw_path, segments, name)` `[verified main.py:342-396,
compiler.py:303]`, which **merges overlaps** then per-clip re-encodes ? concat ? one MP4
`[verified compiler.py:311-317]`. Selection order/duplicates are therefore safe.
- **Downloading = `GET /api/highlights/{video_id}/{filename}`** ? streams the compiled MP4.
Compile returns a **server-local filepath, NOT a URL** `[verified main.py:394]`, so the SPA
constructs this download URL itself. The compiled reel is the **only streamable video that
exists today** `[verified main.py:307-328]`.
- **The floor knob is readable** ? `GET /api/config` exposes `stitching.min_shot_count`
`[verified main.py:121-123]`, so the UI can warn before a selected rally is silently dropped.
- **Job entry** ? `GET /api/jobs/{job_id}` returns `result.video_id` `[verified
main.py:274-293]`, which is how the MVP reaches a video without a (nonexistent) list-videos
endpoint.

**Honest fields vs fabricated/roadmap (critical for the UI):**
- **Honest today** (default `default_segmenter: "gemini"`, per `config.json` `[verified]`):
`start_time`, `end_time`, `duration`, and `metadata.shot_count` (Gemini's
`shuttle_exchange_count`, fallback `max(3, int(dur/0.8))`) + `metadata.shot_count_confidence` (a
**string**, often `"Unknown"`) `[verified gemini.py:470-485]`. On the gemini path
`server`/`receiver` are written `None` ("no fabricated data") `[verified gemini.py:480-487]`.
- **Fabricated ? do NOT surface:** the `motion` demo segmenter fills `server`/`receiver` via
`random.sample(...)` , a random `shot_count`, and random `events` (serve/smash/foul/winner)
`[verified motion.py:191-198]`. `query` returns these columns + `events`, but they are not
ground truth and must stay hidden.
- **Roadmap ? no column, no detector:** shot-type per shot, player identity, match/point score,
game/set grouping. None exist anywhere in the schema; do not consume them `[verified database.py
whole-schema 122-148]`.
- **Correction-loop columns exist but are dead:**
`candidate_segments.human_label/notes/confirmed_segment_id` are defined but no endpoint writes
them `[verified database.py:166-168]` ? that's the M4 corpus extension (engine PR-4/B6,
`UI_ALPHA_EXECUTION_PLAN.md`).
```

4. Design / architecture

```
**Reuse map (existing ? `[verified]`, no change for MVP):** `POST /api/query` (list) ? `POST
/api/compile` (stitch) ? `GET /api/highlights/{video_id}/{filename}` (download); `GET
/api/config` (floor); `GET /api/jobs/{id}` (carry `result.video_id`). **All net-new code is the
SPA** in `khelsutra` `web/` (Vite + React + TS + Tailwind, per `web/README.md`), plus a small
set of *optional* real-gap engine enablers ($4.3) ? none required for MVP.
```

4.1 Components (net-new SPA)

```
- **QueryBar + `parseQuery()`** ? a *pure, deterministic, unit-tested* string ? `{filter, sort}`
```

compiler over `duration` / `ordinal` / `shot\_count`. Renders a ****parsed-pill**** ("filter: duration > 10s · sort: duration desc") so the interpretation is transparent and hand-correctable; greys out shot-type/player/score tokens with an inline "not available yet". No LLM, no network call.

- ****RallyList/Grid**** ? one card per `play\_segment`: ordinal (by `start\_time`), `mm:ss` start, duration (`end?start`), and a shot-count + confidence chip ****only when `metadata.shot\_count` is present**** (absent on detector paths that don't write it). Checkbox per card; the thumbnail area is a placeholder (no endpoint yet).
- ****`useRallySelection()` hook**** ? owns `selectedIds:Set<number>`, `displayOrder`, `apply(queryResult)`, `toggle(id)`, and bulk Select-all / Clear / Invert. Unit-tested (matches the exec-plan's "API client + review-state logic" bar).
- ****SelectionFooter (sticky)**** ? live "N clips / total M:SS"; a ****`min\_shot\_count` warning**** when a selected rally would be dropped at compile (read from `GET /api/config`); reel-name input; one ****Build**** button.
- ****CompileResult**** ? `<video src=GET /api/highlights/...>` preview of the **compiled reel** + a download link.
- ****TypedApiClient**** ? `query`, `compile`, `buildDownloadUrl`; the typed seam to the engine.

****4.2 Data flow**** `[verified anchors inline]`

Gemini segmenter (process time) writes `play\_segments {id, start/end\_time, duration, metadata.shot\_count/confidence/detector}` `[gemini.py:461-498]`
 ? SPA `POST /api/query {video\_id}` ? `{play\_segments:[...]}` `[main.py:331-340]` (****fix**** the static UI's `data.rallies` read ? `play\_segments` `[app.js:344]`)
 ? normalize to `RallyCard[]` + one shared `selectedIds:Set`; `server`/`receiver`/`events` are present in the payload but motion-only fabrications ? ****not surfaced**** `[motion.py:191-198]`
 ? all input modes mutate the ****same**** `selectedIds`: (a) `parseQuery()` predicate over duration/ordinal/shot_count; (b) checkbox toggle + bulk ops; (c) **(post-MVP)** timeline band ? footer recomputes count + ?duration ****client-side****, and warns for any selected rally with `shot\_count < stitching.min\_shot\_count` `[main.py:362-383]`
 ? ****Build**** ? `POST /api/compile {video\_id, segment\_ids: [...selectedIds], output\_filename}` ? stitcher de-dupes via `merge\_overlapping` `[compiler.py:311-317]`, cuts `time\_pairs` from `videos.filepath`, re-encodes per clip ? concat ? one MP4 `[main.py:386-393, compiler.py:303]`
 ? compile returns a ****server-local filepath, not a URL**** `[main.py:394]` ? SPA builds `GET /api/highlights/{video\_id}/{output\_filename}` to preview in `<video>` + download `[main.py:307-328]`.

****4.3 Engine API additions (none for MVP; tagged against real gaps)****

Endpoint	Purpose	Status
--- --- ---		
`POST /api/query`	List rallies (only path) ? fix SPA to read `play_segments` **exists**	
`POST /api/compile`	Stitch selected `segment_ids` ? MP4 **exists**	
`GET /api/highlights/{video_id}/{filename}`	Stream/download compiled reel **exists**	
`GET /api/config`	Read `stitching.min_shot_count` for the warning **exists**	
`GET /api/jobs/{job_id}`	Carry `result.video_id` into the picker **exists**	
`POST /api/compile`	? add `download_url` Return `/api/highlights/...` so SPA stops hand-building it (additive, low-risk; today returns only a filepath `main.py:394`) **modify**	
`GET /api/health`	Engine-offline banner ping the SPA is specified to use (<code>HOSTING_PLAN.md:42</code>) **new**	
`GET /api/videos/{video_id}/rallies`	RESTful/cacheable alias returning the same `{play_segments}` shape **new**	
`GET /api/videos`	List a user's videos for a Match picker (only `get_video(id)` exists, `database.py:418`) ? needs DB enumerate + identity scoping **new**	
`GET /api/videos/{video_id}/source`	(Range) <i>*or*</i> <code>/clip?start=&end=</code> Stream source/per-span video so a rally previews before selection ? neither exists **new**	
`GET /api/videos/{video_id}/rallies/{segment_id}/thumbnail`	Per-rally poster still (no thumbnail column; WASB frames are transient) **new**	
`PATCH /api/segments/{id}`	Persist accept/reject/nudge ?	
	<code>candidate_segments.human_label/notes/...</code> (columns exist, unwritten ? corpus loop) **new**	

****? Dead-ends / do-NOT:**** never surface `server`/`receiver`/`events` (motion-only randoms `[motion.py:191-198]`); never consume shot-type/player/score (no data); never render a confidence ****meter**** ? `shot\_count\_confidence` is a Gemini **string** (often `"Unknown"`) and `play\_segments` has ****no**** numeric confidence column.

5. Risk table

Risk	Severity	Mitigation
High (UX)	MVP selects on text metadata + previews the <i>final</i> reel; preview/timeline deferred to M3 behind a new endpoint	
	<code>`min_shot_count`</code> silently drops selected rallies <code>`[main.py:362-383]`</code> High (looks broken) Footer warns <i>before</i> Build; D7 makes selection explicit; an override is an owner gate (Launch-Report-worthy <code>`[memory: launch-report-convention]`</code>)	
	No match-duration field ? a timeline must derive <code>`total = max(end_time)`</code> , mis-rendering pre/post dead air Med Timeline deferred to M3; never over-promise it as a true scrubber until source streams	
	<code>`shot_count`</code> is an <i>estimate</i> (<code>`shuttle_exchange_count`</code> w/ <code>`max(3,int(dur/0.8))`</code> fallback) <code>`[gemini.py:470-485]`</code> Med Label "approx."; confidence shown as the raw string, not a meter	
	No auth / user scoping anywhere (CORS <code>`*`</code> , <code>`videos.user_id`</code> never set/filtered) High for multi-tester Fine for single-box local alpha; a ship-blocker for any shared host ? gate <code>`GET /api/videos`</code> behind PR-3 scoping	
	compile returns a filepath not a URL <code>`[main.py:394]`</code> Low Client builds the URL for MVP; <code>`download_url`</code> field (M1) removes the brittleness	
	Surface sprawl (query + grid + future timeline + future correction) Med Deliberate IA: query+grid = one screen; correction = separate ? corpus screen (owner call, S8)	

6. Honest limits ? what this does NOT do

A green SPA build + passing ``parseQuery``/selection unit tests prove the *picker* logic only ? *not* that the engine's rally boundaries are correct (the measured *rally-END* weakness is a separate quality track, unaffected by this UI). "Conversational" here means a *deterministic* four-dimension parser, not natural-language understanding. Nothing is implemented in ``web/`` yet ? this is ``[design]``. The feature curates *what the engine already found*; it cannot surface a rally the detector missed, nor split/merge a mis-bounded one (that's the M4 correction loop).

7. Deliverables & progress tracker ? *source of truth*

Legend: ? Todo · ? In progress · ? Done · ? Blocked/gated. *One small PR per row*, branched from ``origin/master``, no stacking. CI (``npm test``) must stay green; merge to ``master`` auto-deploys the site (docs/``web/`` changes don't touch the live ``site/`` Worker).

ID	Deliverable	Depends on	Gated?	Status	PR
P0	This design doc + <code>`docs/README.md`</code> + <code>`NEXT_STEPS.md`</code> pointers				(this PR)
P1	SPA scaffold (Vite+React+TS+Tailwind) in <code>`web/`</code> + typed API client; dev proxy to engine <code>`:8000`</code>	P0	No		
P2	RallyList/Grid (honest fields only) + <code>`useRallySelection()`</code> hook (unit-tested)	P1	No		
P3	<code>`parseQuery()`</code> + parsed-pill + example chips (unit-tested; greys out unavailable tokens)	P2	No		
P4	SelectionFooter + <code>`min_shot_count`</code> warning (from <code>`GET /api/config`</code>)	P2	No		
P5	Build ? <code>`POST /api/compile`</code> ? client-built download URL + <code>`<video>`</code> preview of the reel	P2	No		
P6	<i>(engine repo)</i> <code>`GET /api/health`</code> + offline banner; <code>`/api/compile`</code> returns <code>`download_url`</code>		No		
P7	<i>(engine repo)</i> <code>`GET /api/videos/{id}/rallies`</code> RESTful alias		No		
P8	<i>(engine repo)</i> <code>`GET /api/videos`</code> + PR-3 identity scoping ? A1 Matches screen	P7			
P9	<i>(engine repo)</i> source/clip stream + timeline + per-rally preview/thumbnail	P8			
P10	<i>(engine repo)</i> <code>`PATCH /api/segments/{id}`</code> corpus loop (PR-4/B6) ? A4 Rally Review	P9			

Milestone rollup: *M0/MVP* = P1?P5 (pick?reel on existing API, zero new engine endpoints) · *M1* = P6?P7 (RESTful + reliability polish) · *M2* = P8 (multi-video home) · *M3* = P9 (per-rally preview/timeline) · *M4* = P10 (corpus correction loop) · *M5* = swap ``parseQuery()`` for localized NL behind the same seam (gated on shot/player data landing).

8. Open questions ? owner / external

Blocking gates (need a decision before the gated rows):

- Default selection state* ? load rallies all-ON (curate-by-removal; matches today's "all

rallies" reel) or all-OFF (curate-by-addition)? *Owner product call.*

2. **Is preview-before-select a ship-blocker?** Text-metadata selection is acceptable for MVP, but is the "feel" the owner wants blocked until a source/clip-stream endpoint exists? This is the single biggest backend lift. *Owner scope call.*

3. **MVP entry** ? ship job-tethered (carry `result.video\_id`, no `GET /api/videos`) vs pull multi-video + PR-3 scoping into MVP? *Owner scope call.*

4. **`min\_shot\_count` on the manual path** ? keep the server-side floor silently dropping user-selected rallies (warn in UI) or let an explicit checkbox override it? Touches `/api/compile` default behavior ? **Launch Report** convention applies. *Owner product call.*

Nice-to-knows:

5. May user-facing copy call `parseQuery()` "conversational", given conversational QA is explicitly deferred (`UI\_PROPOSAL.md:66`)? Risk of over-promising NL. *Owner positioning/honesty call.*

6. One screen for query+grid (recommended) vs a separate ? corpus/correction screen for A4? *Owner positioning call.*

9. Definition of done

- [] From a finished job, a user can list rallies, query/select, and download a reel ? on **existing** endpoints.
- [] Only honest fields (ordinal / duration / shot_count+confidence-when-present) are shown; fabricated `server`/`receiver`/`events` are hidden.
- [] `parseQuery()` covers length/count/order/shot_count, greys out unavailable tokens, shows a visible parsed-pill, and is unit-tested.
- [] Selection hook is unit-tested; the `min\_shot\_count` floor is surfaced, not hidden.
- [] `npm run build` (and `npm test`) clean; the static UI's `data.rallies` bug is gone (or the static UI is superseded by the SPA).
- [] \$7 tracker + this DoD updated; doc archived when P1?P5 land (MVP).

10. References

Engine code anchors `[verified this session]`: `backend/main.py:121-123` (config), `:274-293` (jobs), `:307-328` (highlights download), `:331-340` (query), `:342-396` (compile + `min\_shot\_count` floor + filepath-not-URL); `backend/infrastructure/database.py:124-135` (play_segments), `:166-168` (dead correction columns), `:418` (no list-videos), `:427-475` (query read path + events join); `backend/pipeline/segmenters/gemini.py:461-498, 470-485` (honest shot_count, server/receiver=None); `backend/pipeline/segmenters/motion.py:191-198` (fabricated fields); `backend/pipeline/stitcher/compiler.py:80-105, 303, 311-317` (merge/de-dupe + entryptoint); `backend/api/static/app.js:344` (`data.rallies` bug); `config.json` (`default\_segmenter: "gemini")`.

Engine docs: `UI\_PROPOSAL.md:46-47, 66`; `UI\_ALPHA\_EXECUTION\_PLAN.md:38-39`; `HOSTING\_PLAN.md:42`; `OWNED\_MODEL\_IMPLEMENTATION\_PLAN.md:54-55` (conversational seam built now, model punted). **This repo:** `web/README.md`, `REQUEST\_ACCESS\_FORM.md`.

Changelog

- 2026-06-20 ? Initial `DRAFT`. Consolidated three candidate designs (Timeline / Grid / RallyPicker) into the hybrid recommendation via a multi-agent design pass; every engine-fact anchor re-verified against source before writing.

54. user (2026-06-20T08:12:41.395Z)

File created successfully at: C:\Users\avidu\Projects\khelsutra\docs\PER_RALLY_SELECTION.md (file state is current in your context ? no need to Read it back)

55. assistant (2026-06-20T08:12:48.626Z)

Now the pointers ? `docs/README.md` (doc index) and `NEXT\_STEPS.md`.

56. user (2026-06-20T08:12:54.219Z)

The file C:\Users\avidu\Projects\khelsutra\docs\README.md has been updated successfully. (file state is current in your context ? no need to Read it back)

57. assistant (2026-06-20T08:12:59.748Z)

Now update `NEXT\_STEPS.md` ? point the per-rally thread at the new tracked doc.

58. user (2026-06-20T08:13:03.053Z)

The file C:\Users\avidu\Projects\khelsutra\NEXT_STEPS.md has been updated successfully. (file state is current in your context ? no need to Read it back)

59. assistant (2026-06-20T08:13:20.224Z)

Doc + pointers written. Before committing, let me run the site test suite (so I don't push a red PR) and re-verify branch state. The change is docs-only, but I'll confirm rather than assume.

60. user (2026-06-20T08:13:22.864Z)

To https://github.com/avidullu/khelsutra.git
 * [new branch]      docs/per-rally-selection -> docs/per-rally-selection
```

67. user (2026-06-20T08:14:15.409Z)

<https://github.com/avidullu/khelsutra/pull/11>

68. assistant (2026-06-20T08:14:25.256Z)

PR opened: [khelsutra#11](<https://github.com/avidullu/khelsutra/pull/11>). Let me confirm CI kicks off green and then record the checkpoint in memory.

69. user (2026-06-20T08:14:37.094Z)

```
Workers Builds: hidden-king-khelsutra pass 0
https://dash.cloudflare.com/213c12cf60de9041dd8a3521aa206472/workers/services/view/hidden-king-khelsutra/production/builds/83358c99-e84e-46f9-bfc2-b3974dd704ce
site pass 5s
https://github.com/avidullu/khelsutra/actions/runs/27865320445/job/82468366216
```

70. assistant (2026-06-20T08:15:06.606Z)

Both checks pass ? `site` (npm test, 5s) and `Workers Builds`. Let me record the checkpoint in memory (per the checkpoint working agreement).

71. user (2026-06-20T08:15:13.910Z)

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md has been updated successfully. (file state is current in your context ? no need to Read it back)

72. assistant (2026-06-20T08:15:46.232Z)

Done. Both asks handled this turn.

? Repo synced

khelsutra was already at remote head (`master` = `origin/master` = #10, clean tree); the fetch just pruned merged PR branches. I cut my work branch **explicitly from `origin/master`**, staged only my 3 doc paths, and verified only my commit is ahead before pushing ? safe against the concurrent droplet/GPU sessions sharing this checkout.

? Tracked design doc shipped ? [khelsutra#11](<https://github.com/avidullu/khelsutra/pull/11>)

`DRAFT`, ****owner-gated**** (not auto-merged ? it embeds product decisions). CI green (`site` npm test 20/20, Workers Builds pass). Files: `docs/PER\_RALLY\_SELECTION.md` + index/NEXT_STEPS pointers.

****How it was built:**** a multi-agent Workflow (map the real engine contract ? 3 independent designs: timeline / grid / conversational ? judge + synthesize), then ****I personally re-read every load-bearing claim against engine source**** before writing a word ? the `play\_segments` schema, the `app.js` `data.rallies` bug, `\_merge\_overlapping` de-dupe, the `min\_shot\_count` floor, the `gemini` shot_count fallback, the `motion` fabrications, and `default\_segmenter: gemini`. Nothing in the doc is asserted that I didn't verify.

****The headline finding:**** the ****MVP needs zero new engine endpoints**** ? it rides the contract already shipped:

```
POST /api/query ? user picks segment_ids ? POST /api/compile ? GET /api/highlights
```

Recommendation: a ****hybrid**** ? selectable rally ****grid**** (workhorse) + a ****deterministic`parseQuery()`**** bar (no LLM; length/count/order/shot_count only) writing into ****one shared selection set**** + a sticky compile footer. Honest scope baked in: shot-type/player/score are roadmap (no column, no detector); `server`/`receiver`/`events` are `motion`-only fabrications and stay hidden; ****per-rally preview is the one real blocker**** (only the **compiled** reel can stream today) so it's a deliberate later milestone.

Your call ? 4 decisions gate the build (doc §8)

#	Decision	My recommended default
1	Default selection **ON** (curate-by-removal) or **OFF** ? **ON** ? matches today's "all rallies" reel; user removes warm-ups	
2	Is **preview-before-select** a ship-blocker for alpha ? **No** ? ship text-metadata MVP; add the source/clip stream endpoint next	
3	MVP **job-tethered** (carry `video_id`) or pull in multi-video + auth ? **Job-tethered** ? smallest honest slice; multi-video needs identity scoping	
4	Does explicit selection **override** the silent `min_shot_count` floor ? **Warn, don't override** for MVP (override touches a compile default ? Launch Report)	

If those defaults look right, I can proceed to ****P1** (SPA scaffold + typed API client in `web/`)****** and build the MVP (P1?P5, all on existing endpoints). Want me to start with those defaults, or hold for your review of the doc first?

73. user (2026-06-20T08:43:21.413Z)

agreed with your recommendations, please merge the PRs with green CIs and also add any more CIs which might be great to catch regressions

74. assistant (2026-06-20T08:44:31.725Z)

The owner has reviewed and approved the recommendations ? that clears the owner-gate on PR #11. Before merging, I'll lock the now-decided questions into the doc (keep it honest, not stale), then merge. And I'll add regression-catching CI as its own PR (one-PR-per-item). First, let me check open PRs and read the CI/deploy config so the new checks target real risks.

78. assistant (2026-06-20T08:45:43.040Z)

One open PR (#11, mine). Now I understand the deploy surface. Let me check how the VM path applies the schema (to avoid redundant CI) and match the existing test style before adding guards.

79. user (2026-06-20T08:45:44.053Z)

```
1      // Storage adapters for Request-Access submissions.
2      //
3      // PORTABILITY (see docs/PORTABILITY.md): the business logic (validate / toRow /
4      // handleRequest in index.js) is runtime-agnostic ? ALL database coupling lives here.
5      // The Cloudflare Worker uses d1Store(env.DB); an always-on VM uses sqliteStore(db)
6      // over node:sqlite (or better-sqlite3). Same schema.sql, same INSERT ? zero dialect
7      // change. To move hosts, swap the adapter, not the logic.
8
9      export const INSERT_SQL =
10      `INSERT INTO access_requests
11      (segment, name, email, city, org_name, courts, has_gpu, storage, message, consent,
country, user_agent)
12      VALUES (?, ?, ?, ?, ?, ?, ?, ?, ?, ?, ?, ?)`;
13
14      export const insertArgs = (r) => [
15          r.segment, r.name, r.email, r.city, r.org_name, r.courts,
16          r.has_gpu, r.storage, r.message, r.consent, r.country, r.user_agent,
17      ];
18
19      // Cloudflare D1 (async): prepare(sql).bind(...args).run()
20      export function d1Store(DB) {
21          return {
22              async insertAccessRequest(r) {
23                  await DB.prepare(INSERT_SQL).bind(...insertArgs(r)).run();
24              },
25          };
26      }
27
```

```

28 // node:sqlite / better-sqlite3 (sync): prepare(sql).run(...args). For the VM host.
29 export function sqliteStore(db) {
30   const stmt = db.prepare(INSERT_SQL);
31   return {
32     async insertAccessRequest(r) {
33       stmt.run(...insertArgs(r));
34     },
35   };
36 }
37

```

81. assistant (2026-06-20T08:45:57.624Z)

The store's `INSERT\_SQL` columns are the deploy contract against `schema.sql`. Let me confirm whether `server.js` applies `schema.sql` (or inline DDL) ? that determines whether `schema.sql` itself is currently untested.

82. user (2026-06-20T08:45:58.616Z)

```

1 // Always-on VM host for the KhelSutra site ? dependency-free (Node 22+ only).
2 // Serves public/ and POST /api/request-access into SQLite (node:sqlite), using the
3 // SAME handler logic as the Cloudflare Worker (src/index.js). This is the portability
4 // fallback "if Cloudflare acts out" ? see docs/PORTABILITY.md.
5 //
6 // PORT=8080 DB_PATH=/var/lib/khelsutra/access.db node server.js
7 //

```

84. assistant (2026-06-20T08:47:38.864Z)

Confirmed: `server.js:22` applies `schema.sql` via `db.exec(readFile(schema.sql))`, and `server.test.js` round-trips a real insert through it ? so **`schema.sql` ? `INSERT\_SQL` consistency is already covered**. No redundant schema test needed. The real gaps are: (1) **deploy-config drift** (the `wrangler.toml` `name`/bindings ? the #5-class silent live-deploy break, untested), (2) **static-site wiring** (form action, OG meta, capture link ? only partly covered), and (3) **two-host live drift** (parity-check.sh isn't wired to run automatically).

Let me first lock the approved decisions into the doc (keep it honest), then merge #11.

99. user (2026-06-20T08:49:52.537Z)

branch 'ci/regression-guards' set up to track 'origin/master'.

Switched to a new branch 'ci/regression-guards'

ci/regression-guards

cb74ce5 docs(web): tracked design for interactive per-rally selection (RallyPicker) (#11)

100. assistant (2026-06-20T08:49:57.097Z)

Branch ready. Now writing the three regression guards.

101. assistant (2026-06-20T08:50:08.839Z)

```
// Deploy-config guard ? the live Cloudflare deploy is git-connected (merge to `master`
// auto-deploys via Workers Builds). A silent drift in wrangler.toml would break the LIVE
// site with NO test noticing: PR #5 was exactly this ? the wrangler `name` didn't match
// the connected Worker, so builds missed khelsutra.guru. These assertions pin the deploy
// invariants. String-based on purpose (the site is dependency-free; no TOML parser dep).
import { test } from "node:test";
import assert from "node:assert/strict";
```

```

import { readFileSync, existsSync } from "node:fs";
import { join } from "node:path";

const ROOT = join(import.meta.dirname, "..");
const toml = readFileSync(join(ROOT, "wrangler.toml"), "utf8");
const has = (re, msg) => assert.match(toml, re, msg);

test("wrangler `name` matches the git-connected Worker that owns khelsutra.guru", () => {
  // If this drifts, Workers Builds deploys a DIFFERENT worker and the live site goes stale (PR #5).
  has(/^s*name\s*=\s*"hidden-king-khelsutra"/m, "wrangler name must stay 'hidden-king-khelsutra'");
});

test("wrangler `main` and the assets directory point at paths that exist", () => {
  const main = toml.match(/^s*main\s*=\s*"([^\"]+)"/m)?.[1];
  assert.ok(main, "main = ... is missing from wrangler.toml");
  assert.ok(existsSync(join(ROOT, main)), `main entry '${main}' does not exist`);

  const dir = toml.match(/[assets\][\s\S]*?directory\s*=\s*"([^\"]+)"/m)?.[1];
  assert.ok(dir, "[assets] directory is missing from wrangler.toml");
  assert.ok(existsSync(join(ROOT, dir)), `assets directory '${dir}' does not exist`);
});

test("D1 binding is wired (the Request-Access form persists to D1)", () => {
  has(/\[d1_databases\]/, "missing [[d1_databases]]");
  has(/binding\s*=\s*"DB"/, "D1 binding must be 'DB' (code uses env.DB)");
  has(/database_name\s*=\s*"khelsutra-access"/, "D1 database_name drift");
  has(/database_id\s*=\s*"0-9a-f-[36]"/, "D1 database_id missing/!uuid ? deploy binds nothing");
});

test("email-on-registration send binding + notify vars are present", () => {
  // The Email Routing send binding is what emails the owner on each registration (PR #8).
  has(/\[send_email\]/, "missing [[send_email]] binding");
  has(/name\s*=\s*"NOTIFY"/, "send_email binding must be named 'NOTIFY' (code uses env.NOTIFY)");
  has(/NOTIFY_FROM\s*=\s*"/, "NOTIFY_FROM var missing");
  has(/NOTIFY_TO\s*=\s*"/, "NOTIFY_TO var missing");
});

```

102. user (2026-06-20T08:50:08.889Z)

File created successfully at: C:\Users\avidu\Projects\khelsutra\site\src\deploy-config.test.js
(file state is current in your context ? no need to Read it back)

103. assistant (2026-06-20T08:50:13.487Z)

(The preview workflow doesn't apply ? these are Node test files verified via `npm test`, not browser-observable.) Writing the static-assets guard and the parity workflow.

104. assistant (2026-06-20T08:50:22.875Z)

```

// Static-site integrity ? the landing page + capture checklist + OG image ARE the public
// product. server.test.js proves the VM host *serves* "/", "/capture", "/og.png"; this
// guards the CONTENT contract so a broken edit (deleted asset, broken form wiring, dead
// capture link, missing/!absolute OG image) fails CI instead of shipping to the live site.
import { test } from "node:test";
import assert from "node:assert/strict";
import { readFileSync, statSync } from "node:fs";
import { join } from "node:path";

const PUBLIC = join(import.meta.dirname, "..", "public");
const read = (f) => readFileSync(join(PUBLIC, f), "utf8");

```

```

const size = (f) => statSync(join(PUBLIC, f)).size;

test("core public assets exist and are non-empty", () => {
  for (const f of ["index.html", "capture.html", "og.png"]) {
    assert.ok(size(f) > 0, `public/${f} is missing or empty`);
  }
});

test("landing page wires the Request-Access form to the API", () => {
  const html = read("index.html");
  assert.match(html, /id="af"/, "the #af form is gone");
  assert.match(html, /\api\/request-access/, "form no longer posts to /api/request-access");
  assert.match(html, /name="company"[^>]*tabindex="-1"/, "honeypot field removed (bots will get through)");
  for (const field of ["segment", "has_gpu", "storage"]) {
    assert.match(html, new RegExp(`name="${field}"`), `form lost the '${field}' field (a demand signal)`);
  }
});

test("OG + canonical meta point at the live https origin", () => {
  const html = read("index.html");
  assert.match(html, /property="og:image"\s+content="https:\/\/khelsutra\.guru\/og\.png"/,
"og:image must be the absolute live URL");
  assert.match(html, /property="og:url"\s+content="https:\/\/khelsutra\.guru"/, "og:url drift");
});

test("the capture checklist is linked and is a real page", () => {
  assert.match(read("index.html"), /href="\capture(\.html)?"/, "footer capture-checklist link is gone");
  const cap = read("capture.html");
  assert.match(cap, /<html/i, "capture.html is not HTML");
  assert.match(cap, /capture checklist/i, "capture.html lost its checklist content");
});

```

105. user (2026-06-20T08:50:22.893Z)

File created successfully at: C:\Users\avidu\Projects\khelsutra\site\src\assets.test.js (file state is current in your context ? no need to Read it back)

106. assistant (2026-06-20T08:50:31.160Z)

Live-host parity ? the site runs on TWO hosts (Cloudflare Worker + the DO droplet's Node/SQLite twin) that must serve byte-identical pages. The unit suite proves the code works on each host; it CANNOT see that the two LIVE URLs have drifted (e.g. a merge auto-deployed Cloudflare but the droplet wasn't re-synced from git). This runs the existing scripts/parity-check.sh against both live URLs on a schedule ? NOT on PRs, so it never blocks development; a failure surfaces real production drift to the owner.

name: live-parity

```

on:
  schedule:
    - cron: "17 6 * * *" # daily ~06:17 UTC
  workflow_dispatch: {} # and on demand

```

Avoid overlapping runs if a manual dispatch races the cron.

```

concurrency:
  group: live-parity
  cancel-in-progress: false

```

```
jobs:
  parity:
    runs-on: ubuntu-latest
    steps:
      - uses: actions/checkout@v4
      - name: Compare the two live hosts byte-for-byte
        env:
          CF_URL: https://khelsutra.guru
          VM_URL: http://168.144.126.176:8787
        run: bash site/scripts/parity-check.sh
```

107. user (2026-06-20T08:50:31.193Z)

File created successfully at: C:\Users\avidu\Projects\khelsutra\.github\workflows\parity.yml
(file state is current in your context ? no need to Read it back)

108. assistant (2026-06-20T08:50:37.109Z)

Now switch the `test` script to auto-discovery so new test files always run in CI (prevents the "forgot to register a test file" gap):

109. user (2026-06-20T08:50:38.857Z)

<tool_use_error>File has not been read yet. Read it first before writing to it.</tool_use_error>

110. user (2026-06-20T08:50:42.475Z)

```
1      {
2        "name": "khelsutra-site",
3        "private": true,
4        "type": "module",
5        "scripts": {
6          "test": "node --test src/index.test.js src/server.test.js",
7          "test:cf": "node --test src/index.test.js",
8          "test:vm": "node --test src/server.test.js",
9          "deploy": "wrangler deploy",
10         "dev": "wrangler dev",
11         "og": "python make_og.py"
12       }
13     }
14
```

111. user (2026-06-20T08:50:50.516Z)

The file C:\Users\avidu\Projects\khelsutra\site\package.json has been updated successfully.
(file state is current in your context ? no need to Read it back)

112. assistant (2026-06-20T08:50:55.711Z)

Now verify locally ? `node --test` discovery should pick up all four test files (original 20 + 8 new):

113. user (2026-06-20T08:50:59.525Z)

v26.1.0

```
? core public assets exist and are non-empty (1.129ms)
? OG + canonical meta point at the live https origin (0.6447ms)
? the capture checklist is linked and is a real page (0.7445ms)
? wrangler `name` matches the git-connected Worker that owns khelsutra.guru (1.0234ms)
? wrangler `main` and the assets directory point at paths that exist (0.8127ms)
? fetch routes: POST /api hits the handler, other paths delegate to ASSETS (1.7999ms)
? [VM host] serves /capture and /og.png (4.496ms)
? tests 28
```

? pass 28
? fail 0

114. assistant (2026-06-20T08:51:12.133Z)

All 28 pass (20 original + 8 new guards), `node --test` discovery works. Committing the CI-guards PR:

115. user (2026-06-20T08:51:17.194Z)

```

2026-06-20T08:52:42.7290202Z OK /capture 2ada2cfccf855c0d6b31d7bb818e9f29
2026-06-20T08:52:42.7293992Z PARITY: in sync
```

128. assistant (2026-06-20T08:53:57.976Z)

Verified live: `OK / 1598a01a?`, `OK /capture 2ada2cf?`, `\*\*PARITY: in sync` ? the new workflow works and both live hosts are byte-identical. Let me record the checkpoint in memory.

129. user (2026-06-20T08:54:03.342Z)

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md has been updated successfully. (file state is current in your context ? no need to Read it back)

130. user (2026-06-20T08:54:09.058Z)

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md has been updated successfully. (file state is current in your context ? no need to Read it back)

131. assistant (2026-06-20T08:54:32.416Z)

Both PRs are merged and the new CI is verified working end-to-end. Summary:

? Merged (both green, squashed, branches deleted)

- **[khelsutra#11](https://github.com/avidullu/khelsutra/pull/11)** ? the RallyPicker design doc. Before merging I locked your approved decisions into it: **D8** default selection ON . **D9** preview not a ship-blocker . **D10** job-tethered MVP . **D11** warn-don't-override the floor. Status flipped `DRAFT` ? IN PROGRESS`.
- **[khelsutra#12](https://github.com/avidullu/khelsutra/pull/12)** ? the new regression CI.

master is at `eeb8a48`, tree clean, no open PRs.

? New CI to catch regressions

The site auto-deploys on merge, so the guards target what could silently ship broken to the live site ? all dependency-free:

```
| Guard | Catches |
|---|---|
| `site/src/deploy-config.test.js` | `wrangler.toml` drift ? Worker `name` (**the #5 incident**: wrong-worker deploy ? stale live site), `main`/assets paths, D1 binding, the Email-Routing send binding + vars |
| `site/src/assets.test.js` | broken static site ? missing `index/capture/og` assets, broken form wiring (action/honeypot/fields), wrong OG/canonical URLs, dead capture link |
| `.github/workflows/parity.yml` | **Cloudflare ? droplet drift** (the two-host sync) ? runs `parity-check.sh` daily + on-demand, **non-blocking** (schedule/dispatch only, never blocks a PR) |
| `npm test` ? `node --test` discovery | a new `*.test.js` being silently left out of CI |
```

Suite went **20 ? 28 green**. I dispatched the live-parity workflow once to prove it works: it ran green and reported `OK /`, `OK /capture`, **PARITY: in sync** ? so the two live hosts are currently byte-identical too.

Next: build the MVP (P1?P5)

With the design approved and decisions locked, the next deliverable is **P1 ? the SPA scaffold** in `web/` (Vite + React + TS + Tailwind + a typed API client, dev-proxied to the engine at `:8000`), then P2?P5 build the grid + `parseQuery()` + selection footer + compile?download, all on the existing engine endpoints (zero new backend).

Want me to start on **P1** now? Each of P1?P5 will be its own small PR off `origin/master`, CI-green, and ? since they're build work on the approved design (not new product/strategy) ? I can merge them on green per our working agreement unless you'd rather review each first.

132. user (2026-06-20T08:54:35.107Z)

Can you also spin off a design now that both the website and codebase is going to be on a single droplet then can we augment the UI to also drive the badminton-highlight-indexer tool and operate as a "locally instaled UI powered badminton rally indexer and reel generator" ?

133. assistant (2026-06-20T08:55:43.296Z)

This is a meatier, distinct design ? the single-box appliance topology (site + engine co-located) and the UI as the full operator console for the engine. It's its own tracked doc. Critically, there are **active parallel sessions** reshaping the engine's deployment (the recent "decoupled" / `backend.worker` / GPU-provisioning commits), so I must ground this in what they're actually building, not invent a topology that conflicts. Let me mark the new phase and scout the real engine deployment state before designing.

134. user (2026-06-20T08:55:44.207Z)

Chapter marked: "Single-box appliance design". Continue your current work.

135. assistant (2026-06-20T08:56:30.508Z)

Good question ? and it directly shapes both the build and this design, so let me answer it head-on before I go further.

Yes ? live CUJ replay is part of how I'll develop this, not an afterthought. Concretely:

- **UI CUJs via the preview/browser tools** ? I run the SPA dev server and drive the journey headlessly (snapshot ? fill the query bar "top 15 longest" ? assert auto-selection ? toggle a card ? assert footer count/duration ? Build ? assert reel preview/download). I do this against **(a) a deterministic mock engine** (fast, hermetic CUJ replay every iteration) and **(b) a real local engine** for the true end-to-end.
- **Engine-contract live checks** ? since the MVP rides existing endpoints, I exercise `/api/query ? /api/compile ? /api/highlights` against a running FastAPI with at least a small real/stub-indexed video, so the SPA's assumptions are tested against the real API, not a guess.

- ****Automated CUJ regression**** ? bake the key journeys into CI (the same "catch regressions" thread) so a CUJ can't silently break.
- ****Honest boundary**** ? the ***heaviest*** E2E (real 4K footage, GPU WASB, full reel encode against the golden corpus) I hand to you per our working agreement; I verify logic + UI + API-contract paths locally and say plainly what was and wasn't run on real video.

I'll make *****CUJs & live-test plan**" a first-class section of this appliance design doc** (define each journey + how it's replayed live + what's automated vs owner-verified). Now let me ground the design in what the parallel sessions are actually building on the droplet/GPU side.

138. assistant (2026-06-20T08:56:58.470Z)

There's a whole `docs/DECOUPLED_COMPUTE/` track and a `backend/worker` module ? the parallel sessions are building a `*decoupled bucket-driven compute*` model (pluggable StorageBackend local/S3/GCS + a worker that pulls jobs and runs train/infer on a GPU machine). The "single-box appliance" must be designed as a `*deployment profile*` of that architecture, not something that fights it. Let me read the decoupling resume-here and the worker module to ground this precisely.

139. user (2026-06-20T08:56:59.421Z)

```
1      # DECOUPLED_COMPUTE ? Session Handoff / Resume-Here
2
3      **Updated:** 2026-06-20 . **Read this first to resume.** Companion: this whole directory
+ `docs/SETUP_NEW_MACHINE.md`.
4
5      ## TL;DR ? where we are
6
7      The **entire bucket-driven `train` ? infer` pipeline runs end-to-end on a CPU box**, with
the GPU **mocked**
8      (deterministic stub). Validated on a DigitalOcean droplet reading/writing **DO Spaces**,
driven remotely over
9      SSH. Everything is merged to `master` (PRs #246?#254); the suite is **936 green**.
10
11     **The ONE remaining piece for *real* (non-mock) training** is the **Linux-native WASB
`DetectorRunner` (M3.5)**
12     running on a **GPU box** ? it produces *real* shuttle trajectories instead of the
synthetic stub. Once it
13     exists, the **same `worker train` / `worker infer` commands run unchanged**; only the
trajectory source flips.
14
15     ## What's built (all merged to master)
16
17     | PR | What | Key files |
18     |---|---|---|
19     | #249 | Storage layer ? `local` + **S3 (AWS/DO Spaces/R2/MinIO)** + GCS, URI-driven;
gdrive stub | `backend/storage/` |
20     | #251, #254 | **Worker** `python -m backend.worker {infer|train}` ? pull from storage
? pipeline ? push | `backend/worker/__main__.py` |
21     | #247 | CPU-mock detector seam (`RALLY_DETECTOR_IMPL=stub` /
`indexing.detector_impl=stub`) | `backend/pipeline/detectors/stub_runner.py` |
22     | #253 | GPU provisioning ? NVMe scratch + **native WASB setup** + port runbook |
`deploy/digitalocean/{bootstrap,mount_scratch,gpu_setup}.sh` |
23     | #252 | Cross-platform canonicalization (Linux/macOS, not just Windows) | (segmenters,
compiler, doctor.py) |
24     | #246 | The plan directory | `docs/DECOUPLED_COMPUTE/` |
25
26     **Verified e2e (CPU, no GPU, no Gemini key):** `worker train` pulled 7 labels from
Spaces ? `synth_trajectory_from_labels`
27     (label-consistent CPU mock) ? `training.gen0.harness` (shelled out ? `backend` must not
import `training`) ?
28     LOVO over 7 videos (F1 1.000 on the mock, gate=no-ship by design) ? `weights/` to
```

```

Spaces. `worker infer` pulled a
29     real video ? stub ? `outputs/<md5>/` to Spaces.
30
31     ## Resources & access (current)
32
33     - **CPU droplet:** `168.144.126.176` (region `blr1`, CPU-only, no NVMe). SSH: `ssh -i
~/ssh/do_rally root@?`
34     (key generated locally; pubkey added to DO). Code + venv at `~/rally`; Gemini key at
`/root/.keys/GEMINI_API_KEY`.
35     - **DO Spaces:** bucket `**rally-e2e**`, region `**sgp1**`, endpoint
`https://sgp1.digitaloceanspaces.com`.
36     ? **The Spaces key was exposed in chat ? ROTATE it.** Creds live on the box at
`~/aws/credentials` (never in repo).
37     - **Corpus staged in Spaces:** `videos/` (8 .mp4) + `labels/` (7 `.rallies.csv`) +
`weights/0.1.0-smoke/` + `outputs/`.
38     - **Drive corpus** (source): folder `1sHGL7iacnmM80ChT-p2cKy638gK504T_` (gdown-able by
file-id). 7 `[Done]` = video+labels;
39     **Video 1 `GX010135_proxy.mp4` is the held-out (non-Done) test**.
40     - **Helper scripts on the box:** `/root/do_e2e.sh` (reproduces the train+infer e2e),
`/root/do_spaces_config.json`
41     (`storage.s3` sgp1 + `skip_ai_handoff` + `detector_impl=stub` + permissive
validation), `/root/do_stage_{labels,videos}.sh`.
42
43     ## Reproduce the working e2e (today, CPU)
44
45     ```bash
46     ssh -i ~/.ssh/do_rally root@168.144.126.176 'bash ~/do_e2e.sh'
47     # train (7-video LOV0) + infer (real video) from Spaces ? artifacts back to Spaces.
48     ```
49
50     ## NEXT BUILD ? real trajectories (M3.5)
51
52     1. **GPU box** (owner): spin up a DO GPU Droplet **in `sgp1`** (co-located with the
bucket) ? `SETUP_NEW_MACHINE.md` §2
53     has the `doctl` command (verify slugs). Provide a DO API token if you want it
`doctl`-provisioned. Add the same SSH key.
54     2. **Port** (`SETUP_NEW_MACHINE.md` §9): git-archive ? scp ? `mount_scratch.sh` ?
`bootstrap.sh --gpu` ? `gpu_setup.sh`
55     (native WASB conda env) ? secrets (rotated Gemini key + Spaces creds).
56     3. **Build `NativeWasbRunner(DetectorRunner)`** in `backend/pipeline/detectors/` ?
sibling to `WasbRunner` but **without**
57     `WslCommandMixin`: run WASB in-process/native (no `wsl`/`conda
activate`/`to_wsl_mnt_path`), device `cuda/mps/cpu`,
58     weights via env (not `~/models`), emit the identical `Frame,Visibility,X,Y` CSV.
Select it via the existing
59     `detector_impl` seam (`trajectory_hybrid._resolve_runner`). Scout details: `06-RISKS-
AND-OPEN-QUESTIONS.md` (E1?E6 in the
60     merged workflow plan) + `docs/TRACKNET_WSL_SETUP.md`.
61     4. **Acceptance gate:** byte-parity ? same clip ? WSL CSV (Windows) == native CSV
(Linux) + identical candidate windows.
62     5. **Wire real extraction into `worker train`/`infer`:** today `worker train` uses
`synth_trajectory_from_labels`; add a
63     real-extract path that runs the detector per video ? trajectory CSV ? manifest. The
harness + push are unchanged.
64
65     ## Gotchas / open items
66
67     - **`backend` ? `training`** one-way wall ? the worker **shells out** to `python -m
training.gen0.harness`.
68     - **Gen-0 ship-gate F1@IoU is provisional (#172)** ? advisory; do **not** hard-gate on
it.
69     - **WASB-C3** weight provenance is an open **legal** item before sharing any
trajectories/model externally.
70     - WASB (torch 1.11) and TrackNet (TF) must stay in **separate conda envs** (segfault if
co-installed).

```

```
71      - The box still has MinIO (``:9000/:9001`) + a GCS emulator (``:9023`) running from
earlier provider tests (harmless).
72      - Two-provider goal (GCS in a Bangalore-ish region, parallel hosting) and the
`/srv/khelsutra-site` web-hosting verify
73      + a real-Gemini-detection smoke are **queued, not done**.
74
```

141. assistant (2026-06-20T08:57:56.531Z)

This is richer than I assumed ? and the premise is **already partly real**: the decoupled track (PRs #246?#254, 936 green) put ****both the site (`/srv/khelsutra-site`) and the engine (`~/rally`) on this exact droplet**** (`168.144.126.176`), with a pluggable StorageBackend + a ``python -m backend.worker {infer|train}`` bucket-driven pipeline, validated e2e on ****CPU with the GPU mocked****. Crucial honest constraints I now have:

- The droplet is ****CPU-only**** ? real WASB can't run there; it uses ****Gemini**** (key already on the box) or the ****stub**** detector, with real GPU work offloaded to a GPU box via the worker/bucket model (the M3.5 next-build).
- The engine API has ****no auth**** (CORS ``) ? a hard exposure gate for a public single box.
- The droplet is a ****shared testbed**** (MinIO/GCS-emu/`~/rally`/`/srv/khelsutra-site`) ? I'll respect those boundaries.

So the appliance is best framed as a ****deployment profile of the decoupled architecture****, not a competing design. Let me run a grounded design Workflow over the real decoupled-compute + hosting + API docs, with the ****CUJ/live-test plan as a required section****.

142. user (2026-06-20T08:59:23.133Z)

Workflow launched in background. Task ID: wfujxsxtx

Summary: Design the single-box appliance (site+engine co-located) where the UI drives the full indexer?reel loop, grounded in the decoupled-compute architecture; CUJ/live-test plan first-class.

Transcript dir: C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\144a31b7-7962-4fee-9d6f-8a7854daa63f\subagents\workflows\wf_134043cd-8c3

143. assistant (2026-06-20T08:59:40.212Z)

The appliance design Workflow is running in the background (`wfujxsxtx`), grounded in the verified decoupled-compute reality. To recap this turn:

- **Answered your CUJ question** (above): yes ? live CUJ replay with a mock engine + a real local engine via the preview/browser tools, engine-contract checks against a running FastAPI, automated CUJ regression in CI, and the heaviest GPU/real-4K/golden-corpus E2E handed to you. I've made **"CUJs & live-test plan"** a required, first-class section of the design.
- **Key reframe from the scout**: the premise is already partly real ? the decoupled track put both the site (`/srv/khelsutra-site`) and the engine (`~/rally`) on this one droplet, with a StorageBackend + `backend.worker` bucket pipeline (936 green, CPU-validated with GPU mocked). So the appliance is being designed as a **deployment profile of that decoupled architecture**, honest about the CPU-only droplet (Gemini/stub, not local WASB), the no-auth API (edge auth before any public exposure), and the shared-testbed boundaries.

The workflow maps the real decoupled-compute/worker/hosting/UI surface ? proposes 3 appliance architectures (FastAPI-native / unified-origin / decoupled-profile) ? synthesizes a recommendation with a topology, compute-placement matrix, CUJ/live-test plan, milestones, and a doc draft. As before, I'll **verify its load-bearing claims against source myself**, then write the tracked design doc (`khelsutra/docs/LOCAL\_APPLIANCE\_ARCHITECTURE.md`) and open it as a PR for your review ? engine-side changes flagged as proposals to coordinate with the active sessions, not written unilaterally. I'll continue automatically when it completes.

144. user (2026-06-20T08:59:41.635Z)

thanks and please go ahead with the plan and again, keep in mind that with the decouple effort *on a new GPU enabled droplet we should be able to run the e2e i.e. a hosted website and say for now I can point to Google drive or a bucket file or local file upload to the DO Spaces/GCS bucket and be able to generate the highlights and use it* completely from UI

145. assistant (2026-06-20T09:00:36.150Z)

Got it ? that sharpens the target end state, and it maps cleanly onto the decoupled-profile design that's being worked up. Let me restate it so we're locked on the same picture, then confirm how it lands in the doc.

Target you're describing (the headline CUJ):

> A **hosted website** ? from the UI I choose an input ? **a Google Drive file, a bucket file (S3/GCS/DO Spaces URI), or a local upload** that gets streamed into the **DO Spaces/GCS bucket** ? then **generate highlights** on a **new GPU-enabled droplet** running the real e2e pipeline, and **watch/pick/download** the reel ? **all from the UI**.

That's the **decoupled-profile appliance** with the GPU droplet as the real compute, not the CPU/Gemini fallback. Here's what I'm baking into the design as a result:

1. **Ingest is first-class** ? a source menu, all normalizing to "a video object in the StorageBackend bucket".
 - **Local upload** ? chunked upload ? `StorageBackend.put` to DO Spaces/GCS.
 - **Bucket URI** (`s3://` / `gs://`) ? referenced in place, no copy.
 - **Google Drive** (file-id / picker ? server-side fetch into the bucket) ? and I'll **verify** honestly whether Drive is real or still the `gdrive` stub the decoupled handoff mentions, and scope it accordingly (no faking).
2. **GPU droplet** = the real e2e path (native WASB, the M3.5 next-build) as the headline deployment; CPU/Gemini stays the documented fallback (and what runs on the *current* droplet today). The doc's **compute-placement matrix** will make "what runs where, and what's real vs not-yet" explicit.

3. *****Completely from UI***** drives the whole loop: pick source ? ingest-to-bucket ? enqueue worker job ? live progress ? rally index + per-rally selection (the just-merged screen) ? generate reel ? download. That becomes ****CUJ-1****, the primary journey I replay live during development.

4. ****Honesty guardrails carried through:**** the new GPU droplet must have ****edge auth**** before the no-auth engine API faces the public web; Drive/bucket access + per-user data needs consent/training-opt-in per the existing guardrails.

The design workflow is still running (it already includes the decoupled-profile lens, the compute matrix, and the CUJ/live-test plan, so this fits its grain). When it returns I'll ****verify the storage-layer ingest claims (Drive stub, local?bucket wiring) against source myself****, fold this target-state in as the headline, write ``khelsutra/docs/LOCAL_APPLIANCE_ARCHITECTURE.md``, and open it as a PR for your review. Continuing automatically on completion.

146. user (2026-06-20T09:11:44.125Z)

we need to move to a GPU enabled droplet asap so please keep that it mind as well

147. assistant (2026-06-20T09:12:49.623Z)

Understood ? ****GPU-droplet move is now a top priority****, not a someday item. Let me capture that directive in memory (so it survives a context refresh) and then reflect it in the design's sequencing. First, let me grab the exact anchor in the live checkpoint file.

148. user (2026-06-20T09:12:50.575Z)

14 ****? HANDOFF (2026-06-20) ? KHELSUTRA.GURU brand site: shipped, live, portable. Resume the product threads below.**** Separate track from the indexer rally-detection handoff that follows. Full durable record + ramp-up: `[[khelsutra-domain-launch]]`. Repo = ****avidullu/khelsutra**** (NOT this indexer repo).

15 - ****DONE + LIVE this session (PRs #1?#8, all merged, repo clean):**** owner bought khelsutra.guru ? built & launched end-to-end. On ****Cloudflare**** (Worker ``hidden-king-khelsutra`` + D1 ``khelsutra-access``; ****git-connected ? merge `master` auto-deploys****; CI runs ``npm test`` = 20 green): landing page + ``/capture`` checklist + OG image + a ****segmented Request-Access form**** (academy/individual + GPU + storage Qs + free text) ? persists to D1 ****and emails a summary to avi.dullu@gmail.com per registration**** (Email Routing send binding ? VERIFIED live in inbox). Valid SSL; ``hello@`` Email Routing verified.

16 - ****PORTABLE + proven****: identical form runs on a dependency-free ****Node + SQLite**** host (``site/server.js``), ****live + browsable on the owner's D0 droplet ? http://168.144.126.176:8787**** (systemd ``khelsutra-site``, isolated ``/srv/khelsutra-site``; SSH key ``~/.ssh/khelsutra_droplet``). Both-hosts compat ENFORCED in CI (``site/src/server.test.js`` boots the real server). ? Droplet is a SHARED storage testbed ? another session runs MinIO 9000/9001 + GCS emu 9023 + ``/root/do_gcs``; STAY CLEAR. Docs: ``docs/REQUEST_ACCESS_FORM.md``, ``docs/PORTABILITY.md``, ``NEXT_STEPS.md``.

17 - ****? PENDING / next threads (owner ideas this session):**** (1) ****Marketing video**** ? use Grok/Gemini image-gen ? a short video themed for ****serious enthusiasts**** showing the whole record?reel process ? embed on the site. (2) ****Interactive per-rally selection**** (big product feature) ? the engine detects rallies ? present them in a UI so the user ****picks which rallies go into the highlight**** (dynamic, NOT a fixed setting). ? ****Design doc MERGED ? [khelsutra#11](https://github.com/avidullu/khelsutra/pull/11); owner APPROVED ? decisions D8?D11 locked (status IN PROGRESS). ? CI regression-guards MERGED ? [khelsutra#12](https://github.com/avidullu/khelsutra/pull/12): `site/src/deploy-config.test.js` (pins wrangler.toml deploy invariants ? the #5 name-drift class), `site/src/assets.test.js` (static-site content contract), `.github/workflows/parity.yml` (scheduled+dispatch live-parity, NON-blocking); `npm test`?`node --test` discovery; suite 20?28 green; live-parity dispatched ? BOTH hosts byte-in-sync. NEXT = build MVP P1 (SPA scaffold in `web/`: Vite+React+TS+Tailwind + typed API client) ? P1?P5 on existing endpoints.**** Built via a multi-agent design Workflow (research real engine contract ? 3 approaches ? synthesize) with ****every load-bearing claim personally re-verified vs engine source****. Key finding: ****MVP needs ZERO new engine endpoints**** ? rides existing ``POST /api/query`` ? select ``segment_ids`` ? ``POST /api/compile`` ? ``GET /api/highlights``. Recommended hybrid: selectable rally ****grid**** (workhorse) + ****deterministic `parseQuery()`**** (no LLM; length/count/order/shot_count ONLY) writing into ONE shared selection set + sticky compile footer. Honest scope: shot/player/score = roadmap (no column/detector);

```
`server`/`receiver`/`events` = `motion`-only fabrications ? hidden; default `gemini` writes
real-ish `shot_count`; per-rally *preview* blocked until a source/clip stream endpoint lands
(deferred milestone = biggest UX-vs-effort lift). Owner decisions RESOLVED (D8?D11, 2026-06-20):
(a) default selection **ON** (curate-by-removal); (b) preview-before-select **NOT** a ship-
blocker (text-metadata MVP; preview = P9); (c) **job-tethered** MVP (no `GET /api/videos`); (d)
`min_shot_count` = **warn, don't override** (override deferred ? Launch Report). Doc =
`khehsutra/docs/PER_RALLY_SELECTION.md`. Pairs with the "ask for a reel" conversational builder
already teased on the site. (3) productionize droplet (TLS + `vm.khehsutra.guru`), VM-path SMTP
email (currently noop), Always-Use-HTTPS/HSTS, Web Analytics token, `/capture.html`?`/capture`
footer link, delete any orphan `khehsutra-site` Worker, clean CF D1 test rows (`deploy-
test@`/`email-test@`). Revoke the droplet SSH key when done. [[paper-coauthor-aim]]
[[monetization-plan]]

150. assistant (2026-06-20T09:13:55.468Z)

Captured as a **top priority** in the live checkpoint. Here's how I'm threading it.

Where the GPU move sits in the plan: the UI/appliance build and the GPU-droplet move are **parallel tracks**, and only the GPU box is the true critical path for **real** e2e quality:

- The **UI/appliance** work doesn't block on the GPU ? it rides the existing FastAPI (chunked upload ? `/api/process` ? `/api/jobs` ? `/api/query` ? `/api/compile` ? `/api/highlights`) and works today against **Gemini/stub** on the current CPU droplet. When the GPU box lands, the same UI just points at it and the detector flips to real WASB ? no UI rewrite.
- So in the design's milestones, **"stand up the GPU droplet + cut e2e over to it"** becomes the earliest build milestone (M1), running alongside the UI MVP ? not a late phase.

Honest who-does-what (the GPU move has 3 owners):

Piece	Owner	Status
--- --- ---		
Spin a paid DO GPU droplet in `sgp1` + a DO API token You (money + account; I can't spend/provision without a token + your go-ahead) gated on you		
NativeWasbRunner (M3.5) ? real (non-mock) WASB on the GPU box the engine decoupled session (it's their in-flight work; I won't write into the engine repo and collide) next build per their HANDOFF		
The provisioning runbook , the UI/appliance , the cutover wiring + live verification me can start now		

What I can do immediately to accelerate it ? pick either/both:

1. **Draft a ready-to-run GPU provisioning runbook** distilled from the engine's existing `docs/SETUP\_NEW\_MACHINE.md` §2/§9 + `deploy/digitalocean/{bootstrap,mount\_scratch,gpu\_setup}.sh` ? exact `doctl` create command (slug/region verified), port/secret steps ? so you can stand it up in minutes. (Read-only; no spend.)
2. **Drive the provisioning myself via `doctl`** ? if you hand me a DO API token and explicitly authorize the spend ? provisioning a paid GPU droplet is an outward, money-spending action I won't take without that green light.

Want me to fold the **GPU-droplet stand-up runbook** into this design doc as M1 (option 1) by default? I'll do that unless you'd rather I wait. The design workflow is still running; I'll verify its findings, write `LOCAL\_APPLIANCE\_ARCHITECTURE.md` with the GPU move sequenced as M1 + the ingest menu (Drive/bucket/local?bucket) as the headline CUJ, and open the PR. Continuing automatically when it returns.

151. user (2026-06-20T09:13:57.315Z)

sorry GPU enabled machine (droplet or GCS VM or Cloud Run)

152. assistant (2026-06-20T09:14:39.386Z)

No worries ? that's an important generalization: the **GPU host is provider-agnostic**, not specifically a DO droplet. Let me quickly fix one thing in framing (so the design is technically correct) and broaden the captured target.

(Small clarification: **GCS** is Google's **storage**; the GPU **compute** would be a **GCE VM** or **Cloud Run (with GPU)**. The storage bucket ? DO Spaces or GCS ? stays separate from the GPU compute. I'll use that split in the design so we don't conflate them.)

Let me broaden the priority note in memory:

153. user (2026-06-20T09:14:46.348Z)

The file C:\Users\avidu\claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md has been updated successfully. (file state is current in your context ? no need to Read it back)

154. user (2026-06-20T09:14:54.832Z)

The file C:\Users\avidu\claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md has been updated successfully. (file state is current in your context ? no need to Read it back)

155. assistant (2026-06-20T09:15:08.825Z)

Broadened and captured. Net effect on the design:

- **Compute is provider-pluggable, storage stays the bucket.** The decoupled `python -m backend.worker` is the portable unit of compute; the **compute-placement matrix** in the doc now lists **DO GPU droplet · GCE GPU VM · Cloud Run+GPU**, all reading/writing the same S3/GCS bucket. The hosted UI is identical across them ? it enqueues a job and watches bucket/job state; only **where the worker runs** changes.
- **Cloud Run + GPU is the most interesting option economically** ? scale-to-zero, pay-per-job, which lines up directly with the engine's own "per-video billing" framing in `DECOUPLED_COMPUTE` (#246)`. I'll flag it as the recommended direction for cost, **with an honest caveat**: it needs the worker packaged as a **container image**, and WASB's torch-1.11 conda environment (kept separate from TrackNet's TF env) makes that image non-trivial ? so a quick containerization feasibility check is part of the GPU milestone, and I won't promise Cloud Run works until that's verified.
- **M1 ("GPU move ASAP")** is now provider-agnostic: **"stand up a GPU compute target + cut e2e over,"** with a recommended default and the DO/GCE/Cloud-Run options spelled out. Still parallel to the UI MVP (which runs on Gemini today).

The design workflow is still running; I'll fold the multi-provider compute axis + the containerization gap into `LOCAL_APPLIANCE_ARCHITECTURE.md` when I write it, verify the storage-layer claims (incl. the Drive stub and whether any container packaging exists) against source, and open the PR. Continuing automatically when it returns.

156. user (2026-06-20T09:16:34.709Z)

really appreciate it! Make sure to keep them well isolated in PRs which improve the test coverage now that we are inching closer to launch. also make sure that the logs and monitoring aspects are very seriously done eg. full log analysis across all the new code paths added etc. and

157. assistant (2026-06-20T09:17:31.670Z)

Both directives are exactly right for where we are ? and I want to honor them as a standing bar, not just for one PR. (Heads up: your message looks like it got cut off after "...and" ? I'll act on what's clear and you can finish the thought; I'll fold in whatever you add.)

Let me first capture this as a durable quality bar, then I'll confirm how it changes the work.

158. assistant (2026-06-20T09:17:38.582Z)

```
---
name: feedback-launch-quality-bar
description: Approaching launch ? tightly isolated one-item PRs, rising test coverage, and
SERIOUS observability (full log analysis across every new code path).
metadata:
  type: feedback
---
```

As KhelSutra inches toward launch (owner directive 2026-06-20), the quality bar for all new work is raised:

- ****PRs stay tightly isolated**** ? strictly ONE work-item per PR, no stacking; each PR carries the tests for the code paths it adds, and ****test coverage should rise, not regress****.
- ****Logging & monitoring are first-class, not an afterthought**** ? every NEW code path gets deliberate, structured logging; do a ****full log analysis across all new code paths**** (correlation / job IDs threaded through the async ingest ? worker ? compile ? download pipeline; ****loud failures, never silent drops**** ? cf. engine #240 "surface failed chunks loudly"); add health/metrics + explicit error surfacing for the appliance, and inspect logs during CUJ live-replay.

****Why:**** at launch, regressions and observability blind spots are expensive. Isolated PRs keep blast radius small and reviewable; coverage guards behavior; and serious logging/monitoring is the only way to debug a hosted multi-box system (UI + GPU worker + bucket) in production rather than guessing.

****How to apply:**** every appliance / UI / per-rally PR = one item + its tests; track coverage vs the repo floor (the pre-LGTM gate) and don't let it slip. Make ****Observability (logging & monitoring)**** a first-class section of the appliance design doc AND a definition-of-done item, peer to the CUJ/live-test plan. Pairs with `[[working-agreement-merging]]` · `[[working-agreement-checkpoints]]` · `[[launch-report-convention]]` · `[[feedback-tail-long-job-logs]]`.

159. user (2026-06-20T09:17:38.613Z)

File created successfully at: C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\feedback-launch-quality-bar.md (file state is current in your context ? no need to Read it back)

160. user (2026-06-20T09:17:42.441Z)

```
12      - [Feedback: tail long-job logs](feedback-tail-long-job-logs.md) ? proactively tail
progress/summaries from long-running background jobs while they run, not just the final result.
13      - [Working agreement: merging](working-agreement-merging.md) ? owner authorized Claude
to MERGE its own good-engineering-fix PRs on verified-green CI (2026-06-12);
product/strategy/licensing stay owner-gated.
14      - [Working agreement: tracked project docs](working-agreement-tracked-project-docs.md) ?
substantial design/project work gets a **tracked project doc** (template + $7 progress tracker +
definition-of-done); freeze ? track across sessions ? mark done ? archive. Owner-loved framing
(2026-06-16); codified in `CLAUDE.md` + `docs/PROJECT_DOC_TEMPLATE.md` (PR #186).
15      - [Launch Report convention](launch-report-convention.md) ? owner directive
(2026-06-17): EVERY default-config/quality-bit flip ships with a documented **Launch Report**
(total-quality-impact table on both rulers + over-seg guard + honest caveats), recorded for
posterity BEFORE the flip merges. Born from the Gate-A #146 flip that regressed (#151). Pairs
with [[eval-dual-set-regression]].
16      - [Gotcha: shared-checkout branch collisions](gotcha-shared-checkout-branch-
collisions.md) ? spawned tasks + sibling sessions SHARE this checkout; **branch from
`origin/master` explicitly, re-verify HEAD before commit, stage explicit paths, serialize repo
writes.** The #116/#117 collision (owner upset). Global form in ~/.claude/CLAUDE.md.
17      - [Gotcha: long GPU/WSL runs](gotcha-long-runs-gpu-wsl.md) ? running the WASB pipeline
E2E on a big 4K video: Modern Standby kills it (keep-awake), cv2 extraction is the bottleneck
(ffmpeg pre-extract), proxy-index/4K-stitch recipe + how to observe each phase.
18      - [Cache-hygiene policy](cache-hygiene-policy.md) ? retention table (purge frames/staged
vs keep CSVs/DB/reels) + the shipped tooling: self-cleaning runners (keep_frames default false),
tools/cleanup_caches.py (dry-run-first), disk guard, SessionStart nudge hook. The `for e in`
```

WSL footgun.

```
19 - [Tool: trim_video.py](tool-trim-video.md) ? reusable `scratch/trim_video.py` for
keyframe-aware LOSSLESS video trims (drop first/last N sec), `--exact` re-encode with
NVENC?libx264 fallback. Reach for it instead of hand-rolling ffmpeg trims.
20 - [Decision-rigor norm](decision-rigor-norm.md) ? **NUMBERS INFORM, FOUNDATIONS DECIDE**
(owner directive 2026-06-14, set by the Gate-A flip). Every signal/architecture change gets
ablation-layer rigor (per-signal marginal ?F1 + honest CI/sign-test) AND a foundational lens
(extensible/orthogonal/reversible), never numbers alone. Ties [[weak-signals-retained]] +
[[paper-coauthor-aim]].
21
22 ## Project: rally segmentation pipeline
23 - [Candidate segments & fine-tuning](candidate-segments-finetuning.md) ? why raw
detector candidates are persisted (detector-agnostic table); golden-eval-set goal
24 - [TrackNetV4/WASB via WSL2](tracknet-wasb-wsl2-decision.md) ? self-hosted shuttle
trajectory models (not LLM APIs); WASB/TrackNetV3 = MIT, commercial-clear
25 - [Collector?indexer bridge](collector-indexer-bridge.md) ? 4-phase plan to train/eval a
generic temporal rally segmenter; Phases 1?2 done, 3 in progress, 4 next
```

161. user (2026-06-20T09:17:51.034Z)

162. assistant (2026-06-20T09:18:13.108Z)

Saved as a **standing launch quality bar** in memory (so it applies to every PR from here, not just one). Here's how it changes the work:

1. Isolated PRs + rising coverage (for the per-rally MVP P1?P5 **and** the appliance milestones):

- Strictly **one work-item per PR**, no stacking ? each branched off `origin/master`, each independently reviewable/revertable.
- **Every PR carries the tests for the code paths it adds**, and I'll **track coverage vs the repo floor** and not let it regress ? verified myself per the pre-LGTM gate before I merge anything. As we approach launch I'll lean toward **more** coverage on each slice, not just "green".

2. Logging & monitoring taken seriously ? I'm making **Observability** a first-class section of the appliance design doc and a definition-of-done item (peer to the CUJ/live-test plan), covering:

- **Structured logging at every new code path**, with a **correlation/job ID threaded end-to-end** through the async pipeline (UI ? ingest ? bucket ? worker ? compile ? download) so one request is traceable across the UI, FastAPI, and the GPU worker box.
- **Loud failures, never silent drops** ? carrying forward the engine's own ethos (#240 "surface failed chunks loudly"); a partial reel must never look complete.
- **A deliberate log-analysis pass over each new code path before merge** ? confirm each path actually logs entry/result/error meaningfully (not just that it runs), and **inspect those logs during CUJ live-replay**.
- **Health/metrics + error surfacing**, and **log aggregation** so logs aren't stranded on a transient Cloud Run/GPU instance that scales to zero.

I'll treat your "...and" as an unfinished thought ? **please finish it and I'll fold it in** (and update the saved quality bar). The appliance design workflow is still running; when it returns I'll verify its findings against source, then write `LOCAL\_APPLIANCE\_ARCHITECTURE.md` with the Observability section + the GPU-move (M1, multi-provider) + the ingest menu + the CUJ/live-test plan, and open the PR.

163. user (2026-06-20T09:18:24.525Z)

highlight-indexer\144a31b7-7962-4fee-9d6f-8a7854daa63f\tasks\wfujxsxtx.output</output-file>
<status>completed</status>
<summary>Dynamic workflow "Design the single-box appliance (site+engine co-located) where the UI
drives the full indexer?reel loop, grounded in the decoupled-compute architecture; CUJ/live-test
plan first-class." completed</summary>
<result>{"decoupled":{"storage_contract":"StorageBackend ABC = backend/storage/base.py:17.
Abstract methods: fetch_to_local(ref, dst=None, *, overwrite=False)->str (base.py:21),
put(local_path, ref, *, content_type=None)->StorageRef (:27), exists (:32), stat (:35),
list(prefix)->Iterator[StorageRef] (:38), delete (:42); plus a NON-abstract
signed_url(ref,*,ttl,method) that raises NotImplementedError by default (:45-49) ? callers MUST
treat that as expected and fall back to fetch_to_local (local can't sign; gdrive only
emulates).\n\nURI scheme (backend/storage/ref.py:48 parse_uri + docstring :1-13): bare path or
local:// => local (today's behaviour, IDENTITY passthrough, no copy);
s3://&lt;bucket&gt;/&lt;key&gt; => s3 (covers AWS + Cloudflare R2 + DO Spaces + MinIO,
distinguished only by endpoint_url); gcs:// (or gs://, normalized) => gcs;
gdrive://&lt;folderId&gt;/&lt;path&gt; => gdrive (follow-up stub). Windows C:\\... has no ://
so falls through to local. Value objects: StorageRef(backend,bucket,key,uri) frozen dataclass
with a .name property (ref.py:34-45); StorageStat(size,modified,etag,content_type)
(ref.py:25).\n\nThin URI helpers in backend/storage/__init__.py:
get_storage(backend,config,**overrides) (:43), fetch(uri,dst,config,overwrite) (:55),
put(local_path,uri,config,content_type) (:63), list_uris(prefix_uri,config) (:71). Backends are
lazy-resolved (__init__.py:26 _backend_class) so `import backend.storage` never pulls
boto3/google SDKs ? they import inside the concrete module (s3.py:29 `import boto3`).
CREDENTIALS NEVER IN CONFIG: s3.py:8-10 + S3Storage.__init__ (s3.py:22) takes only
endpoint_url/region/addressing_style/signed_url_ttl; boto3's default chain (env
AWS_ACCESS_KEY_ID/SECRET, instance role, ~/.aws) supplies creds. A client can be injected for
tests (s3.py:26).\n\nLocalStorage (local.py:18): fetch_to_local is identity when dst is None or
dst==src (local.py:33), else shutil.copyfile; put is a copy that no-ops when src==dst (:42-47);
list walks the dir (:56). So backend='local' is byte-for-byte the pre-storage-layer
behaviour.\n\nBucket layout (04 doc §3, lines 56-66): videos/&lt;md5&gt;.mp4 (immutable, byte-
identical to what labels were made on), labels/&lt;sport&gt;/&lt;video_id&gt;.csv, manifest.json
(the join table ? needs an md5 field added, an M2 prereq per 02 §4),
weights/&lt;semver&gt;/{model,manifest} + weights/checkpoints/,
outputs/&lt;video_id&gt;/{highlights.mp4, intervals.csv, report.json}.\n\nStorageConfig
(backend/config/models.py:291): backend: Literal["local","s3","gcs","gdrive"]="local";
output_root:str=""; per-backend loose dicts local/s3/gcs/gdrive (:301-304) passed straight to
the backend constructor (endpoints/regions only, no secrets).","worker_cli":"Entrypoint
backend/worker/__main__.py ? `python -m backend.worker {infer|train}`. Docstring (:1-15): a THIN
ORCHESTRATOR composing the SAME building blocks as the backend.main CLI (validator registry
-&gt; segmenter -&gt; report), never a forked pipeline. Parser at build_parser()
(:302).\n\nINFER ? cmd_infer (:88): `python -m backend.worker infer --video-uri &lt;uri&gt;
--out-uri &lt;prefix&gt; [--segmenter] [--config] [--scratch DIR] [--max-frames] [--set k=v]`.
Flow: (1) load_config + _apply_overrides (:49, dotted-path setattr onto the typed pydantic
config, _coerce bool/int/float at :36); set config.output.output_dir=scratch (:95). (2) PULL:
storage.fetch(video_uri, scratch/in.mp4) ? identity for local://, download for s3/gcs (:98). (3)
IDENTITY: compute_video_id = whole-file MD5 (:101), the labels/&lt;video join key; pulled
bytes must be byte-identical. (4) VALIDATE via the SAME validator_registry as the main CLI
(:105), write video row to a scratch SQLite DB (:107). (5) SEGMENT:
segmenter_registry.get(seg_name or config.indexing.default_segmenter).process_video(...)
(:120-127). (6) emit_indexer_report in a finally (:136, parity with main CLI, never raises). (7)
SERIALIZE outputs/&lt;video_id&gt;/{intervals.csv, report.json} ? intervals.csv is decimal-
second [start,end]+shot_count+ending_reason, the join-friendly schema matching the rally-
annotator labels (_write_intervals_csv :62). (8) PUSH each file via storage.put to
&lt;out_prefix&gt;/outputs/&lt;video_id&gt;/&lt;fn&gt; (:149-154), idempotent on
video_id.\n\nTRAIN ? cmd_train (:192): `python -m backend.worker train --corpus-uri
&lt;prefix&gt; --out-uri &lt;prefix&gt; --version &lt;semver&gt; [--trajectory-source
synth|detector] [--segmenter wasb_hybrid] [--floor] [--fps] [--frame-width] [--config]
[--scratch] [--set]`. Flow: list labels under &lt;corpus&gt;/labels/*.csv (storage.list_uris
:217); REQUIRES &gt;=2 for leave-one-video-out (:219). Two trajectory sources, train
pipeline+harness identical either way (docstring :196-201): (a) synth (DEFAULT, the CPU \"mock
GPU\") ? synth_trajectory_from_labels (stub_runner) makes deterministic label-consistent shuttle
paths, NO GPU/WSL (:260-262); (b) detector ? REAL trajectories: resolve a DetectorRunner once
(_resolve_train_detector :162), index videos/ by stem, fetch each video, probe real fps/width,
runner.run_predict -&gt; trajectory CSV (:242-258). Build manifest.json of specs (:269), then
SHELL OUT (subprocess, because backend must NOT import training) to `python -m

```

```

training.gen0.harness --manifest &lt;m&gt; --out &lt;dir&gt; --version &lt;semver&gt; [--floor
&lt;f&gt;]` (:276-283). PUSH the versioned bundle to
&lt;out_prefix&gt;/weights/&lt;version&gt;/&lt;fn&gt; (:289-294).\n\n_resolve_train_detector
(:162) reuses the segmenter's _resolve_runner seam so worker and live CLI build the detector
identically; rejects a non-trajectory segmenter (:179) and runs runner.healthcheck() before use
(:184). Config knobs: --config (config.json), --set dotted overrides; the validated GPU-
free/secret-free combo is RALLY_DETECTOR_IMPL=stub + --set indexing.skip_ai_handoff=true +
storage.s3 settings (docstring :8-11, HANDOFF.md).","compute_abstraction":"Two ORTHOGONAL axes,
deliberately separated (07 doc §2, lines 27-39): (A) ComputeBackend = WHERE a job runs (coarse,
per-job: local | hosted | byo_worker / DO droplet / serverless) ? picks the machine; (B)
DeviceContext = HOW a GPU stage runs ON that machine (fine, spec-aware, per-stage: probe the
real GPU, resolve batch/precision/chunk knobs). Conflating them is the named design
trap.\n\nSTATE TODAY: ComputeBackend is PLANNED ONLY ? `grep ComputeBackend backend/` returns
nothing; it is named in PLATFORM_ARCHITECTURE.md (registry local|hosted|byo_worker) and
inventoried as a FUTURE registry alongside StorageBackend in 07 §1 (:19) and 01 §3.4. NO
ComputeBackend code, NO DeviceContext/DeviceSpec/DeviceProfile code ? 07 doc is a PROPOSAL
(status :3) to be built at M3.5, NOT M0 (07 §6 :153, §5 caveat 2 :150).\n\nThe compute MAP /
GPU-vs-CPU contract (07 §3 table lines 45-56, the load-bearing rule :57-59): \"a GPU-bound stage
is a pure, restartable unit whose only job is frames -&gt; artifact (the Frame,Visibility,X,Y
CSV or a feature JSON); everything downstream is device-agnostic CPU that reads that artifact.\"
GPU work is concentrated in the detection substrate ONLY ? person detection (torchvision, clean
CPU fallback) + shuttle trajectory (WASB torch / TrackNet TF). Validators, ffmpeg chunk/stitch
(libx264, nvenc optional), ByteTrack, windowing/candidate-merge, Gemini handoff (network I/O),
DB/eval/calibration, Gen-0 head training (~4.5GB, minutes) are CPU/device-agnostic. This
artifact boundary is EXACTLY where GPU and CPU work can live on different machines (the
decoupling), and is already how EXPERIMENT_HARNESS/GOLDEN_DATA split today (07 §3 point
2).\n\nWhat abstracts compute placement TODAY (built): (1) the storage URI scheme ? local vs
s3/gcs decides whether bytes are co-located or remote, transparently to the pipeline; (2) the
detector_impl seam in trajectory_hybrid.py::_resolve_runner (:65): RALLY_DETECTOR_IMPL env
(precedence) or indexing.detector_impl in {auto=WSL via _build_runner
... (truncated 144030 chars, full result in C:\Users\avidu\AppData\Local\Temp\claude\C--Users-

316             "note": "Best BYO-compute narrative: explicitly reserves the storage/compute-
target selector mapping 1:1 to ComputeBackend (WHERE) and the bucket-worker bridge as the scale
path. Most honest about the FastAPI-loop-vs-worker-CLI split. Exposure is Cloudflare-Access-only
(no firewall/localhost-bind invariant stated as load-bearing as in B), so slightly less safe-by-
construction. MVP scope matches B."
317         }
318     ],
319     "recommended_architecture": "HYBRID of B (Reverse-Proxied Unified Origin) as the
structural spine + C's \"compute is a setting / bucket-worker as the reserved scale path\"
framing. Concretely: ONE box runs the khelsutra web/ React SPA served as static assets behind an
edge gate (Caddy basicauth for a self-contained appliance, OR cloudflared Tunnel + Cloudflare
Access email-OTP per HOSTING_PLAN.md), with /api/* reverse-proxied to the engine FastAPI bound
to 127.0.0.1:8000 (already true, main.py:638) and the DO firewall blocking inbound 8000. The SPA
drives the EXISTING in-process FastAPI worker loop (process -> jobs -> query -> compile ->
highlights) for the single-box MVP, with StorageBackend=local (default) so the worker's
pull/push degenerates to read-local/write-local. Compute placement is a visible SETTING surfaced
from a thin new GET /api/capabilities (CPU droplet = gemini real OR stub mock; GPU box = native
WASB; remote = bucket worker), and the UI's compute/storage-target selector is the reserved
decoupled-era seam (shown disabled with 'single-box: local' until the bucket-worker
orchestration bridge lands). The embedded curation screen is the already-approved
PER_RALLY_SELECTION.md RallyPicker verbatim. This wins because it is exposure-safe by
construction (B), uses the real React scaffold and matches the gated two-host topology already
designed (C/HOSTING_PLAN), reserves the BYO-remote-GPU seam without faking it (C), and ships the
full CUJ on the CPU droplet today via gemini/stub (all three).",
320     "rationale": "Scores: A=15, B=18, C=18. B and C tie at 18; the recommendation
fuses them because their strengths are complementary and non-conflicting. B contributes the
load-bearing SAFETY INVARIANT ? the engine is no-auth with CORS '' (main.py:42), so the ONLY
defensible posture on a public box is: engine stays bound to 127.0.0.1 (verified main.py:638),
the cloud firewall blocks 8000 (and the 9000/9001/9023 MinIO/GCS-emulator test ports), and a

```

proxy/tunnel is the sole ingress with auth at the edge. That makes exposure-safe a structural property, not a checklist hope. C contributes the BYO-COMPUTE story the request-access form is literally collecting demand for: 'compute is a setting' rendered from engine config, with the storage-URI + ComputeBackend(WHERE) seams reserved so adding a remote GPU worker later is a new endpoint, not a UI rewrite. A scores lower (15) only because serving the SPA from backend/api/static couples the UI to the engine repo and abandons the khelsutra web/ React + Cloudflare Pages auto-deploy investment ? but A's same-origin insight is preserved (the browser sees ONE origin; the engine's CORS '*' becomes irrelevant from the browser side because the proxy is the boundary). All three agree on the decisive facts: the CPU droplet has NO GPU so real detection there is gemini-only (cloud, needs key, leaks <=1280px chunks to Google) or stub (CPU mock, NOT real detection); native WASB is the in-progress M3.5 piece on branch feat/native-wasb-runner whose acceptance gate is owner-verified byte-parity on a real GPU box; and the FastAPI loop and the backend.worker bucket CLI are SEPARATE today (the bucket bridge is net-new, out of MVP). The hybrid keeps the MVP honest (single-box FastAPI loop) while the architecture leaves room for the scale path without contradicting the just-shipped StorageBackend/worker decoupling ? a single box is precisely the degenerate storage=local + compute=local collapse of that same three-plane split."

373     "live_test_plan": "First-class, layered so every CUJ is replayed LIVE throughout
development ? fast hermetic loop for UI, real-engine loop for contract truth, owner for
hardware. Tag every assertion [verified]/[design].\n\nLAYER 1 ? MOCK ENGINE (hermetic, fast,
default dev + CI). Stand up a tiny FastAPI (or MSW/handler) that implements the EXACT engine
contract surface the console uses ? /api/upload/init|part|complete, /api/process (202+job_id),
/api/jobs/{id} (scriptable state machine: queued->running with stage strings->done|failed,
including the 'failed: interrupted by restart' terminal), /api/query (play_segments fixtures
incl. a motion-sourced one with empty server/receiver/events to test the honesty-hiding),
/api/config, /api/capabilities (one fixture per box profile: CPU-no-key, CPU-with-key, GPU),
/api/compile, /api/highlights (a tiny static mp4), and the NET-NEW /api/videos +
/api/reels/{video_id}. The mock lets the SPA drive ALL FOUR CUJs in <1s with no GPU/key/network.
Drive it via the Claude Preview / browser tools (preview_start the Vite dev server ->
preview_fill the upload picker -> preview_click through process/poll/RallyPicker -> assert the
reel link via preview_snapshot/network) so each CUJ is a recorded browser replay. This is where
reload-survival (CUJ-2), the query field-name bug (CUJ-3 reads play_segments), and capability
honesty (CUJ-4) are caught.\n\nLAYER 2 ? ENGINE-CONTRACT CHECKS against a REAL running FastAPI
(semi-hermetic). Boot the actual `python -m backend.main --server` on 127.0.0.1:8000 with
storage=local + detector_impl=stub + skip_ai_handoff=true (the GPU-free, key-free combo) and run
contract tests that assert the mock and the real engine agree shape-for-shape: 202 payload keys,
jobs status enum, query result.play_segments schema, compile {status,filepath}, highlights
content-type. This is the anti-drift gate between Layer 1's mock and reality ? it MUST run in CI
(the engine is pip-installable, the stub needs no GPU). Any new endpoint (/api/videos,
/api/reels, /api/capabilities) is born with both a mock handler AND a real-engine contract test
in the same PR.\n\nLAYER 3 ? REAL LOCAL E2E on the CPU droplet (the actual MVP substrate).
Through the edge gate, run CUJ-1 end to end with segmenter=stub (mock detection, real plumbing)

```

for a key-free pass, and with segmenter=gemini (real boundaries, needs key) for a real-quality pass on a SHORT clip to bound cost. Verify the reverse-proxy posture LIVE: assert /api on the public origin returns through the proxy AND that raw :8000 (and :9000/:9001/:9023) are refused from outside (firewall) ? the exposure-safety invariant is a TEST, not an assumption. Run the Cloudflare-vs-droplet dual-host parity check pattern (parity.yml/parity-check.sh) for any screen that has both paths.\n\nLAYER 4 ? CI REGRESSION (green-gates-merge). Reuse khelsutra test.yml (npm test) + a new job that boots the stub engine for Layer-2 contract tests; node --test / Vitest for the SPA; the browser-replay CUJ scripts run headless. One PR per progress-tracker row off origin/master, no stacking; CI green is the merge gate. Coverage stays at/above the repo floor.\n\nLAYER 5 ? OWNER-ONLY HARDWARE E2E (handed off explicitly). The heaviest checks the offline suite CANNOT do: (a) native WASB byte-parity (WSL CSV == native CSV + identical candidate windows) on a REAL GPU box; (b) real-4K golden-corpus runs through gemini AND native WASB with the labelled videos; (c) Modern-Standby/keep-awake + cv2-vs-ffmpeg extraction behavior on long 4K; (d) real chunked browser upload of a multi-GB file end to end. These are owner-gated and reported back into \$7; the design states plainly they were NOT verified in this offline, subprocess-mocked suite.",

```

167. assistant (2026-06-20T09:18:41.050Z)

Excellent synthesis ? recommendation is **B+C hybrid** (reverse-proxied unified origin, engine bound to 127.0.0.1 with edge auth = exposure-safe by construction; compute-as-a-setting with the bucket/remote-GPU worker as the reserved scale path). Let me read the milestones, engine changes, decisions, risks, and the doc draft.

```

9000/9001, GCS emulator 9023) ? must not be treated as production; firewall those ports; rotate the chat-shared GEMINI_API_KEY."

509],

510 "design_markdown": "> **Status:** `DRAFT` ? `owner-gated` . **Owner:** Avi .
 Created: 2026-06-20 . **Last updated:** 2026-06-20\n> **Lifecycle:** `DRAFT` ? IN PROGRESS ?
 DONE ? archived` (move to docs/archives/ when DONE)\n> **Tracking anchors:** \$7 progress tracker
 is the source of truth; indexed in docs/README.md; pointer in NEXT_STEPS.md + memory current-
 state once work starts\n> **Relation to existing docs:** peer-of `PER\_RALLY\_SELECTION.md` /
 `REQUEST\_ACCESS\_FORM.md`; extends `UI\_PROPOSAL.md` alpha screens; consumes the decoupled
 `StorageBackend`/`worker` seams and `HOSTING\_PLAN.md` gating\n> **Honesty note:** each claim
 tagged [verified] / [researched] / [design]; not legal/financial advice.\n\n## 0.
 TL;DR\nKhelSutra Studio is a **single-box, UI-powered rally indexer + reel generator**: the
 khelsutra `web`/` React SPA, served behind an **edge auth gate**, drives the **existing** engine
 FastAPI loop (upload ? index ? pick rallies ? reel ? download) on ONE machine, with
 `StorageBackend=local`. The single most important caveat: the engine has **zero app-layer auth
 and CORS** [verified main.py:42], so safety is structural ONLY because the engine stays
 bound to `127.0.0.1:8000` [verified main.py:638], a firewall blocks inbound 8000, and a reverse
 proxy/tunnel is the sole authenticated ingress ? **the gate, not the app, is the tenancy
 boundary**. On the CPU droplet real detection is **gemini (cloud)** or **stub (CPU mock)** ?
 real local GPU detection needs the separate GPU box (native WASB, M3.5, in progress).\n\n## 1.
 Problem & goal\nThe decoupled engine just shipped a `StorageBackend` ABC + a `python -m
 backend.worker {infer|train}` dispatcher [verified backend/storage, backend/worker/`__main__.py`],
 and the FastAPI loop already covers process ? jobs ? query ? compile ? highlights [verified
 main.py]. What's missing is a **console** that lets a non-CLI operator run the whole loop on a
 single box, honestly, behind a gate. Concrete outcome: an operator signs in, uploads a clip,
 watches it index, picks rallies, and downloads a reel ? on the live CPU droplet today
 (gemini/stub), and on a GPU box later (native WASB) with **no UI fork**. Read to get current:
 `PER\_RALLY\_SELECTION.md` (\$3/\$4/\$10 contract anchors), `HOSTING\_PLAN.md` (gating),
 `DECOUPLED\_COMPUTE\_HANDOFF.md` (what's built), `VIDEO\_LOCALITY\_MODEL.md`
 (privacy/retention).\n\n## 2. Decisions locked\n| # | Decision | Source / date | Implication
 |\n|---|---|---|---|\n|\n| D1 | Reverse-proxied **single origin** ; engine stays `127.0.0.1:8000` |
 [verified main.py:638]; 2026-06-20 | CORS `` is moot from the browser; proxy is the boundary
 |\n| D2 | **Edge auth**, zero engine auth code | HOSTING_PLAN.md; 2026-06-20 | Caddy basicauth
 OR cloudflared+Cloudflare Access |\n| D3 | MVP drives the **in-process FastAPI worker** loop,
 `storage=local` | [verified job_worker.py, local.py:33]; 2026-06-20 | bucket worker = reserved
 scale path, out of MVP |\n| D4 | Embed **RallyPicker** from PER_RALLY_SELECTION.md verbatim |
 PER_RALLY_SELECTION.md PR #11; 2026-06-20 | console = superset, do not redesign the picker |\n|
 D5 | Console lives in the khelsutra **web/** React scaffold | README.md:14; 2026-06-20 |
 Cloudflare Pages root, not engine static |\n| D6 | Compute placement is a **setting** rendered
 from `/api/capabilities` | [design]; 2026-06-20 | UI offers only what the box can honestly do
 |\n\n## 3. Foundation ? research / prior art [verified unless noted]\n- **FastAPI loop**: POST
 /api/process (202+job_id) ? poll GET /api/jobs/{id} ? POST /api/query ? POST /api/compile ? GET
 /api/highlights/{video_id}/{filename} (FileResponse) [main.py]. Chunked upload
 /api/upload/init|part|complete EXISTS but app.js never calls it.\n- **Worker**: one module-
 global `ThreadPoolExecutor(max\_workers=1)`; the DB jobs table is the clock; `fail\_stale\_jobs`
 sweeps queued/running on boot [job_worker.py].\n- **Storage**: `storage.backend='local'` is the
 default [models.py:298]; `fetch\_to\_local` is identity [local.py:33], `put` no-ops on src==dst
 [local.py:42] ? a single box is the degenerate collapse of the control/data/compute split.\n-
 Compute seam: `detector\_impl` ? {auto=WSL, native=NativeWasbRunner, stub=CPU mock}; base
 `build\_native\_runner` REFUSES today [trajectory_hybrid.py:57-63]; `native\_wasb\_runner.py` is
 present on branch feat/native-wasb-runner [verified] with an owner-only byte-parity acceptance
 gate.\n- **Gating**: cloudflared Tunnel (outbound-only, no inbound ports) + Cloudflare Access
 email-OTP; backend trusts `Cf-Access-Authenticated-User-Email` [HOSTING_PLAN.md].\n- **Droplet
 reality**: CPU-only, NO GPU; co-hosts the marketing site (node :8787) + the engine (~/rally);
 ran the full train+infer e2e against DO Spaces with the GPU mocked [SETUP_NEW_MACHINE.md,
 HANDOFF.md].\n\n## 4. Design / architecture\n**Topology**. **ONE box: an edge gate
 (cloudflared+Access or Caddy basicauth) ? a reverse proxy/static host serving the `web`/` SPA
 bundle and proxying `/api/` to `127.0.0.1:8000` ? the engine FastAPI (control plane = jobs
 table + max_workers=1 drain; data plane = uploads + compile + highlights) ? LocalStorage ? the
 detector seam (gemini/stub today; native WASB on a GPU box). The firewall blocks inbound 8000 +
 the test ports 9000/9001/9023. The marketing site stays a separate systemd unit on a separate
 subdomain.\n\n**Request path**. **One origin to the browser; two upstreams behind it. The engine's
 CORS `` is irrelevant because the proxy is the only door. Reels stream via /api/highlights; in-
 UI source/proxy playback has NO endpoint today (deliberate post-MVP add, tracked).\n\n**Compute
 placement** (one UI, surfaced from `/api/capabilities`): CPU droplet = gemini (real, cloud, key)

OR stub (mock); local GPU box = native WASB (real); owner Windows = WSL `auto` (real today); remote GPU = bucket worker (reserved, out of MVP). The console renders ONLY advertised capabilities ? never a `wasb\_hybrid` option on a CPU box, never `\"real\"` when `detector\_impl=stub`. \n\n**Auth/exposure.** No engine auth, by design; the gate is external. Invariant (non-negotiable): engine bound to localhost + firewall closes 8000 + edge gate up. Go-live checklist [HOSTING_PLAN.md:102-108]: Access/basicauth ON, rotate the chat-shared GEMINI_API_KEY, set `security.allowed\_video\_root`, rate-limit, per-user quota.\n\n**UI operator console** (web/ SPA, superset of RallyPicker): (S1) Upload & Process ? wire the existing chunked endpoints, segmenter picker from /api/capabilities; (S2) Progress ? 3s poll of free-text stage, `\"one job at a time\"`, restart-failure state; (S3) Rally pick ? reel ? EMBED RallyPicker verbatim, honor min_shot_count, no motion server/receiver/events, no fake confidence; (S4) Reels/History ? needs GET /api/videos + GET /api/reels/{video_id} for reload-survival; (S5) Settings ? render config+capabilities, compute/storage target selector shown DISABLED ('single-box: local'). **Per-rally is ONE screen (S3)** of the console, not the whole thing.\n\n**REUSE MAP.** Reused (no re-plumb): the full /api loop, the in-process worker, the chunked upload endpoints (un-called), LocalStorage default, the detector seam incl. the landing NativeWasbRunner, the RallyPicker design + its anchors, the web/ scaffold, the HOSTING_PLAN gate, SETUP_NEW_MACHINE runbook. Net-new: Caddyfile + systemd units; GET /api/capabilities; GET /api/videos; GET /api/reels/{video_id}; the SPA console screens; a retention sweep; the tracked doc; (reserved) the bucket-worker bridge.\n\n## 5. Threat model / risk table\n| Threat | Today | Mitigation |\n|---|---|---|\n| No app auth, CORS `` | publicly-reachable :8000 is wide open | localhost bind + firewall + edge gate; LIVE posture test |\n| Test ports exposed (MinIO/GCS emu) | 9000/9001/9023 on shared droplet | firewall closes them |\n| Retention | output/uploads never deleted | sweep / keep-proxy-only before non-owner exposure |\n| Surprise Gemini bill | no cost ceiling/ledger | per-video cap; ai_max_workers=1 (already) |\n| Shared-checkout collisions | active worker sessions share the tree | branch from origin/master, re-verify HEAD, explicit `git add` |\n\n## 6. Honest limits ? what this does NOT do\nDoes NOT add multi-tenant identity/RLS (single-tenant alpha; uploads/outputs global). Does NOT run real WASB on the CPU droplet (gemini or stub only). Does NOT make the remote-GPU bucket path work (design only; selector disabled). Does NOT provide in-UI source playback, job cancel, or a real progress bar (coarse free-text stage, poll-only). Does NOT containerize (runbook, no Dockerfile [verified]). Does NOT verify native WASB (owner byte-parity on a real GPU box, not this offline suite).\n\n## 7. Deliverables & progress tracker ? SOURCE OF TRUTH\n| ID | Deliverable | Depends on | Gated? | Status | PR |\n|---|---|---|---|---|---|\n| T1 | Tracked doc + contract freeze + index/pointer | ? | owner | ? | |\n| T2 | Mock engine + capability fixtures + browser-replay CUJ scripts | T1 | no | ? | |\n| T3 | Caddyfile + systemd units; firewall; edge auth; rotate key | ? | owner | ? | |\n| T4 | Wire chunked upload + segmenter picker (S1) | T2 | no | ? | |\n| T5 | Progress screen (S2) | T4 | no | ? | |\n| T6 | GET /api/capabilities (engine) + banner | T2 | coord | ? | |\n| T7 | Embed RallyPicker (S3) + compile/download | T4 | no | ? | |\n| T8 | GET /api/videos + GET /api/reels (engine) | ? | coord | ? | |\n| T9 | Library/Settings (S4/S5) | T6,T8 | no | ? | |\n| T10 | Retention sweep for output/uploads | ? | owner | ? | |\n| T11 | Native WASB wired + owner byte-parity (P4) | branch | owner | ? | |\n| T12 | Bucket-worker bridge (P5, BYO-compute) | T8 | owner | ? | |\n\nLegend ? Todo ? In progress ? Done ? Blocked/gated. ONE small PR per row, branched from origin/master, NO stacking.\n\n## 8. Open questions ? owner / external\nBlocking gates: edge-auth choice (Access vs basicauth); retention defaults (privacy/consent); per-video Gemini cost ceiling; who owns the P5 bridge + how it coordinates with active worker sessions. Nice-to-knows: console home (web/ vs engine static); review-playback endpoint priority; per-user scoping timing; containerization.\n\n## 9. CUJs & live-test plan (REQUIRED)\n**CUJs:** CUJ-1 upload?index?reel?download (core); CUJ-2 re-open a past match after reload; CUJ-3 pick-by-query (deterministic filters + honesty-hiding); CUJ-4 settings/compute placement (truthful capabilities).\n\n**Live-test plan (5 layers).** L1 MOCK ENGINE ? a tiny FastAPI/MSW implementing the exact contract (upload, process 202, jobs state machine incl. restart-failure, query w/ a motion fixture, config, capabilities per box profile, compile, highlights, the new videos/reels) so the SPA drives all 4 CUJs in <1s, replayed via the Claude Preview/browser tools (start dev server ? fill upload ? click through ? assert reel link). L2 CONTRACT CHECKS ? boot the REAL `python -m backend.main --server` with storage=local + detector_impl=stub + skip_ai_handoff (GPU-free, key-free) and assert mock vs real agree shape-for-shape; every new endpoint is born with a mock handler AND a real-engine contract test in the same PR. L3 REAL LOCAL E2E ? on the droplet through the gate: CUJ-1 with stub (no-key) and gemini (real, short clip to bound cost); LIVE posture test that raw :8000/:900x are refused from outside; reuse the parity.yml dual-host pattern. L4 CI REGRESSION ? npm test + a stub-engine contract job + headless browser-replay CUJ scripts; green gates merge; coverage at/above floor. L5 OWNER HARDWARE ? native WASB byte-parity on a real GPU box, real-4K golden-corpus (gemini + native), Modern-Standby/cv2-vs-ffmpeg behavior, multi-GB browser upload; reported back into S7, stated plainly as NOT verified in the offline suite.\n\n## 10. Definition of done\nCUJ-1 works end to

end on the droplet (gemini + stub) behind the gate; raw :8000 unreachable from outside (tested); browser upload wired; RallyPicker embedded with honesty rules; /api/capabilities + banner truthful; reload-survival via /api/videos + /api/reels; retention sweep in place; tracked doc §7 all ??-resolved; CI green; key rotated.\n\n## 11. 169. assistant (2026-06-20T09:19:06.714Z)

Outstanding, deeply-grounded synthesis. The recommendation hinges on one **safety invariant** I already verified this session (engine binds `127.0.0.1` at `main.py:638`, CORS `` at `:42`). Per the attribution agreement, let me verify the other load-bearing claims before committing them to a doc ? the un-called upload endpoints, `max\_workers=1`, the storage-local default/identity, the native-runner "refuses today" state, and that `capabilities`/`videos`/`reels` truly don't exist.

170. user (2026-06-20T09:19:08.147Z)

```
1      """Chunked upload (B2, PR-2) ? extracted from backend.main into its own router.
2
3      Browser uploads arrive in sequential parts ? security.max_part_mb (free-tier edge
4      proxies cap request bodies at ~100 MB ? HOSTING_PLAN §2), are assembled server-side
5      under security.upload_dir, then submitted to /api/process by the returned path.
6      Upload state is in-process by design (this is the single-box alpha): a server restart
7      aborts partial uploads and the client re-inits. Per-user partitioning of upload_dir
8      arrives with PR-3 identity scoping.
9
10     The startup config lives on ``backend.main.global_config`` (set ONLY in ``main()``).
11     ``upload_cfg`` resolves it through the ``backend.main`` module object so it always
12     reads the live value the server set at startup (and so tests that monkeypatch
13     ``backend.main.global_config`` flow through unchanged).
14     """

172. assistant (2026-06-20T09:19:45.860Z)

Verified ? with **two honesty refinements** my check caught** (this is why I verify rather than trust):

- `max_workers=1` ? (`job_worker.py:37`), storage default `"local"` ? (`models.py:298`), `detector_impl="auto"` default ?, chunked upload endpoints exist (`uploads.py`, "submitted to /api/process by the returned path? restart aborts partial uploads") ?, and `capabilities`/api/videos`/api/reels` indeed don't exist ?.`
- **Refinement 1:** native WASB is **partially** wired, not uniformly "refuses" ? `fusion_hybrid._build_native_runner` returns NativeWasbRunner` (fusion_hybrid.py:86) while trajectory_hybrid` still raises (:57-63). I'll state that precisely.`
- **Refinement 2:** `ai_max_workers` default is 5, not 1 (models.py:183) ? so the doc must not claim Gemini concurrency is "already capped at 1."`

Let me confirm the exact upload route paths and that `app.js` doesn't call them, then I'll write the doc.`

173. user (2026-06-20T09:19:47.387Z)

```

64:@router.post("/api/upload/init")
89:@router.put("/api/upload/{upload_id}/part/{index}")
123:@router.post("/api/upload/{upload_id}/complete")
147:@router.delete("/api/upload/{upload_id}")

```

174. user (2026-06-20T09:19:48.734Z)

```

88:         const response = await fetch("/api/process", {
373:         const res = await fetch("/api/compile", {

```

175. assistant (2026-06-20T09:20:49.427Z)

All verified, including the exact upload routes (`POST /api/upload/init`, `PUT ?/part/{index}`, `POST ?/complete`) and that `app.js` only calls `/api/process` + `/api/compile` ? never the upload endpoints (they're built but un-wired). I now have everything to write an honest doc, with the refinements + your two clarifications (ingest menu, multi-provider GPU) + the required Observability section folded in.

Let me cut the branch off `origin/master` (concurrent-session safety) and write the doc.

176. user (2026-06-20T09:20:52.816Z)

branch 'docs/local-appliance-architecture' set up to track 'origin/master'.
Switched to a new branch 'docs/local-appliance-architecture'
docs/local-appliance-architecture
eeb8a48 ci(site): add deploy-config + static-asset guards and a live-parity workflow (#12)

177. assistant (2026-06-20T09:23:09.829Z)

Single-box appliance ? UI-powered rally indexer + reel generator (KhelSutra Studio)

```
> **Status:** `DRAFT` ? owner-gated (auth choice, retention, cost ceiling, GPU host, P5 bridge)
. **Owner:** Avi . **Created:** 2026-06-20 . **Last updated:** 2026-06-20
> **Lifecycle:** `DRAFT` ? IN PROGRESS ? DONE ? archived` (move to `docs/archives/` when DONE)
> **Tracking anchors:** $9 progress tracker is the source of truth; indexed in `docs/README.md`;
pointer in `NEXT_STEPS.md` + memory `current-state` once work starts.
> **Relation:** peer-of `PER_RALLY_SELECTION.md` / `REQUEST_ACCESS_FORM.md` in this repo;
**consumes** the engine's decoupled `StorageBackend` + `python -m backend.worker` seams and the
FastAPI loop; **extends** the engine's `HOSTING_PLAN.md` gating + `UI_PROPOSAL.md` alpha
screens. Engine-side changes here are **proposals to coordinate** with the active
decoupled/worker sessions ? not written unilaterally.
> **Honesty note:** every engine-fact claim is tagged `[verified]` (read against engine source
this session), `[design]` (proposed here), or `[researched]` (needs sign-off). Not
legal/financial advice.
```

0. TL;DR

****KhelSutra Studio**** turns the engine from a CLI into a ****single-box, UI-powered rally indexer + reel generator****: the khelsutra `web/` React SPA, served behind an ****edge auth gate****, drives the ****existing**** engine FastAPI loop (ingest ? index ? pick rallies ? reel ? download) on ****one machine****, with `StorageBackend=local` for the MVP. It is the ****single-box deployment profile** of the just-shipped decoupled architecture ? storage=local + compute=local is the degenerate collapse of the same storage/worker split.

The ****single most important caveat:**** the engine has ****zero app-layer auth and CORS `\*\*`** `[verified backend/main.py:42]`, so safety is structural ****only**** because the engine stays bound to `127.0.0.1:8000` `[verified backend/main.py:638]`, a firewall blocks inbound `8000`, and a reverse proxy/tunnel is the sole authenticated ingress ? ****the gate, not the app, is the tenancy boundary.****

Two honest hardware truths: (1) the current droplet is ****CPU-only**** ? real detection there is ****Gemini (cloud)**** or ****stub (CPU mock)****; ****real local-GPU detection needs a GPU host**** (native WASB, in-flight). (2) The owner priority is to ****stand up a GPU host ASAP**** ? provider-agnostic (DO GPU droplet / GCE GPU VM / Cloud Run+GPU) ? but that runs ****in parallel**** with the UI MVP, which ships on Gemini today.

1. Problem & goal

The decoupled engine just shipped a `StorageBackend` ABC + a `python -m backend.worker {infer|train}` dispatcher `[verified backend/storage/, backend/worker/\_\_main\_\_.py]`, and the FastAPI loop already covers `process` ? `jobs` ? `query` ? `compile` ? `highlights` `[verified backend/main.py]`. What's missing is a ****console**** that lets a non-CLI operator run the whole loop on a single box, ****honestly, behind a gate****.

****Headline CUJ (owner's words):**** a ****hosted website**** where I pick an input ? ****a Google Drive**

file, a bucket file (`s3:///`gs://`), or a local upload** ? it lands in the **bucket (DO Spaces / GCS)** or locally ? I **generate highlights** on a **GPU-enabled host** running the real e2e ? I **pick rallies, watch, and download** ? **completely from the UI.**

Outcome ("good"): an operator signs in, picks a source, watches it index, curates rallies, downloads a reel ? on the **live CPU droplet today** (Gemini/stub), and on a **GPU host later** (native WASB) with **no UI fork**.

Read to get current: `PER\_RALLY\_SELECTION.md` (\$3/\$4/\$10 contract anchors), engine `HOSTING\_PLAN.md` (gating), `DECOUPLED\_COMPUTE/HANDOFF.md` (what's built), `VIDEO\_LOCALITY\_MODEL.md` (privacy/retention).

2. Decisions locked

#	Decision	Source / date	Implication
D1	Reverse-proxied single origin ; engine stays `127.0.0.1:8000` <code>[verified main.py:638]</code> ; 2026-06-20	CORS `` is moot from the browser ? the proxy is the boundary	
D2	Edge auth , zero engine auth code `HOSTING_PLAN.md`; 2026-06-20	Caddy basicauth OR cloudflared + Cloudflare Access	
D3	MVP drives the in-process FastAPI worker loop, `storage=local` <code>[verified job_worker.py:37, local.py:33]</code> ; 2026-06-20	bucket worker = reserved scale path, out of MVP	
D4	Embed RallyPicker from `PER_RALLY_SELECTION.md` verbatim PR [#11]; 2026-06-20	the console is a superset; do not redesign the picker	
D5	Console lives in the khelsutra web/ React scaffold `web/README.md`; 2026-06-20	Cloudflare-Pages-style root, not engine static	
D6	Compute placement is a setting , rendered from `GET /api/capabilities` <code>[design]</code> ; 2026-06-20	UI offers ONLY what the box can honestly do	
D7	Ingest is a source menu (local upload · bucket URI · Drive) normalizing to one video object <code>[verified backend/storage/ref.py parse_uri]</code> ; 2026-06-20	Drive is a stub today ? scoped honestly (\$4.2)	
D8	GPU host is provider-agnostic (DO droplet / GCE VM / Cloud Run+GPU); storage stays the bucket Owner 2026-06-20	compute and storage are separate planes; no provider lock-in	
D9	Observability is first-class ? structured logs on every new path + a DoD item Owner 2026-06-20	see \$5; verified during CUJ replay	

3. Foundation ? what the engine gives us today `[verified this session unless noted]`

- FastAPI loop:** `POST /api/process` (202 + `job_id`) ? poll `GET /api/jobs/{id}` ? `POST /api/query` ? `POST /api/compile` ? `GET /api/highlights/{video_id}/{filename}` (FileResponse) [main.py]. Chunked upload exists ? POST /api/upload/init` . `PUT /api/upload/{id}/part/{i}` . `POST /api/upload/{id}/complete` . `DELETE /api/upload/{id}` [verified uploads.py:64,89,123,147] ? but the bundled app.js never calls them (it only hits /api/process` + `/api/compile` [verified app.js:88,373]). So browser upload is client-wiring only, no engine change.`
- In-process worker:** one module-global `ThreadPoolExecutor(max_workers=1)` [verified job_worker.py:37] ? strictly one job at a time; the DB jobs` table is the clock; fail_stale_jobs` sweeps queued/running on boot. Gemini chunk concurrency is a separate knob indexing.ai_max_workers` (default 5 [verified models.py:183]; set to 1 to serialize) ? it is not already 1.`
- Storage:** `storage.backend` default = "local"` [verified models.py:298]; LocalStorage.fetch_to_local` is identity [verified local.py:33], put` no-ops on src==dst` ? so on a single box the worker's pull?pipeline?push collapses to read-local/write-local. URI scheme parse_uri` [verified ref.py]: bare/local:/// ? local; s3:/// (AWS/R2/DO Spaces/MinIO, by endpoint) ; gcs:///`gs:///` ; gdrive:///` ? follow-up stub (emulated only). Credentials never in config ? boto3 default chain / ~/aws` [verified s3.py].`
- Compute seam:** `indexing.detector_impl` ? {auto`=WSL, native`=Linux-native, stub`=CPU mock}; default "auto"` [verified models.py:129], resolved in trajectory_hybrid._resolve_runner` [verified :76-85]. Native WASB is in-flight on branch feat/native-wasb-runner`:native_wasb_runner.py` exists [verified]; fusion_hybrid._build_native_runner` returns NativeWasbRunner` [verified fusion_hybrid.py:86] while trajectory_hybrid._build_native_runner` still raises` [verified :57-63]. Acceptance gate = owner byte-parity (WSL CSV == native CSV) on a real GPU box ? not exercisable on the droplet or in the offline suite. Treat native as not production-verified.`

```
- **Worker CLI:** `python -m backend.worker {infer|train}` pulls a `--video-uri` ? pipeline ?
pushes `outputs/<video_id>/{intervals.csv,report.json}` `[verified worker/___main__.py:88,149]`.
The validated GPU-free/key-free combo: `detector_impl=stub` + `--set
indexing.skip_ai_handoff=true` + `storage.s3`.
- **Gating:** cloudflared Tunnel (outbound-only, no inbound ports) + Cloudflare Access email-
OTP; backend trusts `Cf-Access-Authenticated-User-Email` `[HOSTING_PLAN.md]`. `GET /api/health`
is **expected but does not exist** `[HOSTING_PLAN.md:42]`.
- **Droplet reality:** `168.144.126.176`, **CPU-only, NO GPU**, region `blr1`; co-hosts the
marketing site (`/srv/khelsutra-site`, node `:8787`) **and** the engine (`~/rally`); ran the
full train+infer e2e against DO Spaces with the **GPU mocked** `[SETUP_NEW_MACHINE.md,
DECOUPLED_COMPUTE/HANDOFF.md]`. Shared testbed: MinIO `9000/9001` + GCS emulator `9023` also run
there.
- **Absent (net-new):** `GET /api/capabilities`, `GET /api/videos` (only single-row
`get_video(id)`), `GET /api/reels/{video_id}`, any source/proxy streaming endpoint, any
**Dockerfile**, any per-video **cost ledger** `[verified ? grep returns none]`.
```

4. Design / architecture

4.1 Topology & request path

ONE box: **edge gate** (cloudflared+Access or Caddy basicauth) ? **reverse proxy / static host**
serving the `web/` SPA bundle and proxying `/api/\*` ? engine **FastAPI `127.0.0.1:8000`** ?
LocalStorage ? **detector seam** (Gemini/stub today; native WASB on a GPU host). The
firewall blocks inbound `8000` + the test ports `9000/9001/9023`. The marketing site stays a
separate systemd unit on a **separate** subdomain.

...

PUBLIC INTERNET

```
? (1) EDGE GATE ? the ONLY ingress; auth lives HERE, not in the app
?      cloudflared Tunnel + Cloudflare Access (no inbound ports) OR  Caddy :443 + basicauth
?
????????????????????????????????????????????????????????????????????????????????????
? ONE BOX  firewall BLOCKS inbound 8000 + 9000/9001/9023                                ?
? (2) reverse proxy / static host (Caddy/cloudflared)                                ?
?      /, /assets/* ? web/ React SPA      /api/*, /api/highlights/* ? :8000 ?
?      ? ONE ORIGIN to the browser ? engine CORS '*' is irrelevant ?
?      ?

????????????????????????????????????????????????????????????????????????????????????
RESERVED SCALE PATH (out of MVP): console "compute target" selector ? storage=s3 (DO Spaces)
? SEPARATE GPU host runs `python -m backend.worker infer --video-uri s3:///?` ? outputs/<vid>/
back
(needs a NET-NEW orchestration endpoint reflecting outputs into the jobs/poll contract)
...
```

4.2 Ingest sources (the headline) ? one menu, one normalized video object

All sources normalize to *****a video the pipeline can read***** ? a local path (MVP) or a
`StorageRef` (scale):

```
| Source | Path today | Status |
|---|---|---|
| **Local upload** | SPA chunks the file ? `max_part_mb` via the existing
`/api/upload/init|part|complete` `[verified uploads.py]` ? server path ? `POST /api/process`.
(Scale: also `StorageBackend.put` to `s3://`/`gcs://`.) | **wire client only** (endpoints exist)
|
| **Bucket URI** (`s3://`, `gs://`) | the worker already fetches `--video-uri` ? local ?
pipeline `[verified worker/___main__.py:98]`. From the UI, a small **ingest-to-process** step
(fetch the ref ? `/api/process`, or enqueue the worker) is **net-new** | **design** (storage
```

layer ready) |
| ****Google Drive**** (`gdrive://`) | `parse\_uri` recognizes it, but the gdrive backend is an
****emulated stub**** `[verified ref.py, DECOUPLED\_COMPUTE research]` | ****stub ? roadmap;**** MVP
requires a Drive?bucket pre-step; do ****not**** present Drive as live until the backend is real |

4.3 Compute placement matrix (one UI, surfaced from `/api/capabilities`)

Placement	Runs	Needs	Real/mock	Honest caveat
****CPU droplet ? gemini**** (MVP target)	`segmenter=gemini`, in-proc worker	`GEMINI\_API\_KEY`;		
network; ****no GPU****	****REAL****	Cloud brain: uploads ?1280px chunks to Google ? ****must be in		
consent copy****; ****no per-video cost ceiling**** today				
****CPU droplet ? stub****	trajectory hybrid + `detector\_impl=stub`+`skip\_ai\_handoff`	nothing		
****MOCK****	not real tracking ? UI must label "stub (CPU mock ? not real detection)";			
demo/regression only				
****CPU droplet ? motion****	`segmenter=motion`	nothing	REAL, low-quality	only no-key/no-
GPU real segmenter; never surface `server/receiver/events` (fabricated)				
****GPU host ? native WASB**** (in-flight)	`wasb`+`detector\_impl=native` ? `NativeWasbRunner`			
(in-proc torch)	a ****GPU host ? DO GPU droplet / GCE GPU VM / Cloud Run+GPU****; `WASB\_WEIGHTS`			
****REAL****, on-device	partially wired (fusion builds it, trajectory refuses); ****owner byte-			
parity gate****; ****Cloud Run/GCE need a containerized worker ? no Dockerfile exists, and WASB's				
torch-1.11 conda env makes the image non-trivial****				
****Owner Win+WSL ? auto****	`wasb`+`detector\_impl=auto` (WSL2+conda)	Windows+WSL2+GPU	REAL	
(today)	Windows-only transport; the working real-GPU path for owner verification			
****Remote GPU worker via bucket**** (reserved)	console CPU + `storage=s3`; separate GPU host			
runs `backend.worker infer` | bucket creds; a GPU host; a ****net-new orchestration endpoint**** |
REAL (remote) | FastAPI loop and worker CLI are ****separate**** today; "remote GPU as a setting" is
****design**** ? selector shown ****disabled**** in MVP |

****Provider note:**** ****Cloud Run + GPU**** (scale-to-zero, pay-per-job) is the strongest fit for the
engine's own ****per-video-billing**** economics (`DECOUPLED\_COMPUTE` #246) ? gated on the
****containerization feasibility check**** above.

4.4 Auth / exposure (non-negotiable invariant)

No engine auth, by design; the gate is external. ****Invariant (all three must hold):**** engine
bound to `127.0.0.1` + firewall closes `8000` + edge gate up. Go-live checklist
`[HOSTING\_PLAN.md:102-108]`: Access/basicauth ON; ****rotate the chat-shared `GEMINI\_API\_KEY`****;
set `security.allowed\_video\_root`; rate-limit; per-user quota.

4.5 UI operator console (web/ SPA ? superset of RallyPicker)

- ****S1 Ingest & Process**** ? the source menu (§4.2) + a segmenter picker from `/api/capabilities`
? `POST /api/process`.
- ****S2 Progress**** ? 3s poll of the free-text stage (`hashing/validating/segmenting/finalizing`),
a ****"one job at a time"***** notice, and the restart-failure terminal state.
- ****S3 Rally pick ? reel**** ? ****embed RallyPicker verbatim**** (`PER\_RALLY\_SELECTION.md`): honor
`min\_shot\_count`; never render motion `server/receiver/events` or a fake confidence meter.
****Per-rally is ONE screen of the console.****
- ****S4 Reels / History**** ? needs `GET /api/videos` + `GET /api/reels/{video\_id}` for ****reload-
survival****.
- ****S5 Settings**** ? render `config` + `capabilities`; the compute/storage ****target selector
shown DISABLED**** ("single-box: local") until the bucket-worker bridge lands.

4.6 Reuse map

****Reused (no re-plumb):**** the full `/api` loop; the in-process worker; the chunked upload
endpoints (un-called); LocalStorage default; the detector seam incl. the landing
`NativeWasbRunner`; the ****RallyPicker**** design + anchors; the `web/` scaffold; the
`HOSTING\_PLAN` gate; the `SETUP\_NEW\_MACHINE` runbook. ****Net-new:**** Caddyfile + systemd units;
`GET /api/capabilities`; `GET /api/videos`; `GET /api/reels/{video\_id}`; `GET /api/health`; the
SPA console screens; ingest-from-bucket wiring; a retention sweep; (reserved) the bucket-worker
bridge.

5. Observability ? logging & monitoring `[required, first-class]`

Launch-readiness directive (owner 2026-06-20): ****logs and monitoring taken seriously, with a
full log-analysis pass across every new code path.**** The engine already uses a centralized
Python logger `[verified main.py:12-17]` ? carry that discipline into every new path.

- **Correlation ID end-to-end.** Thread the existing ``job_id`` (from ``/api/process``) **plus** an ``upload_id`/`request_id`` through `ingest ? process ? jobs ? compile ? highlights`, and into the worker for the bucket path, so **one CUJ is traceable** across UI ? FastAPI ? worker ? GPU host. Log it on every line.
- **Structured logs.** New endpoints/screens emit structured (JSON-able) logs at **entry / result / error** ? not just "it ran". The SPA logs client-side errors + failed fetches with the same correlation id.
- **Loud failures, never silent drops.** Carry the engine's ethos (#240 "surface failed chunks loudly") + RallyPicker's ``min_shot_count``-warning rule: a partial/empty reel must **never** look complete; every dropped clip/chunk is logged + surfaced in the UI.
- **Health + metrics.** Ship the missing ``GET /api/health`` [`HOSTING_PLAN.md:42``] and a thin metrics surface (jobs queued/running/failed, last error, disk free, per-video cost once a ledger exists) for the engine-mode banner + alerting.
- **Aggregation for transient hosts.** A scale-to-zero Cloud Run / GPU host is **ephemeral** ? logs must ship to a durable sink (the bucket or a log service), not die with the instance.
- **Log-analysis pass before merge (DoD item).** Every PR that adds a code path includes a check that the path logs meaningfully, and the **logs are inspected during CUJ live-replay** (\$8 Layers 1?3). Ties `[[feedback-launch-quality-bar]]`.

6. Risk table

Risk	Today	Mitigation
No app auth + CORS	<code>`[main.py:42`]</code> open if any of {localhost-bind, firewall, gate} slips	enforce all three; LIVE posture test that raw <code>`:8000`</code> is refused from outside
Test ports on shared droplet	MinIO <code>`9000/9001`</code> + GCS emu <code>`9023`</code> firewall closes them	Retention <code>`output`/`uploads`</code> originals never deleted sweep / keep-proxy-only before any non-owner exposure
Surprise Gemini/GPU bill	no cost ceiling/ledger per-video cap; <code>`ai_max_workers`</code> (default 5) tunable; <code>`max_workers=1`</code> job serialization	Native WASB unverified partially wired; owner-parity-gated treat as not-production-verified until owner byte-parity on a real GPU box
New engine endpoints	<code>`capabilities`/`videos`/`reels`/`health`</code> don't exist coordinate engine PRs with active sessions; branch from `origin/master` , re-verify HEAD, explicit <code>`git add`</code>	Drive ingest overstated <code>`gdrive://`</code> is a stub don't present Drive as live; require Drive?bucket pre-step until real
No Dockerfile	runbook-only reproducibility feasibility-check a worker image before promising Cloud Run/GCE	Shared-checkout collisions active worker sessions share the engine tree the branch-safety protocol on every engine-side PR

7. Honest limits ? what this does NOT do

Does **not** add multi-tenant identity/RLS (single-tenant alpha; uploads/outputs global). Does **not** run real WASB on the CPU droplet (Gemini or stub only). Does **not** make the remote-GPU bucket path work (design; selector disabled). Does **not** provide in-UI source playback, job cancel, or a true progress bar (coarse free-text stage, poll-only). Does **not** containerize (runbook; no Dockerfile ``[verified]``). Does **not** verify native WASB (owner byte-parity on a real GPU box, not this offline suite). A green SPA + contract tests prove the **console plumbing**, not engine rally-detection quality (a separate track).

8. CUJs & live-test plan ``[required]``

CUJs: **CUJ-1** ingest (Drive/bucket/local) ? index ? reel ? download (core); **CUJ-2** re-open a past match after reload; **CUJ-3** pick-by-query (deterministic filters + honesty-hiding); **CUJ-4** settings/compute placement (truthful capabilities).

Live-test plan ? 5 layers, every CUJ replayed LIVE throughout development:

- **L1 ? Mock engine (hermetic, fast, default + CI).** A tiny FastAPI/MSW implementing the **exact** contract (upload; ``process`` 202; ``jobs`` state machine incl. restart-failure; ``query`` with a motion fixture for honesty-hiding; ``config``; ``capabilities`` per box profile ? CPU-no-key / CPU-with-key / GPU; ``compile``; ``highlights`` tiny mp4; the new ``videos`/`reels``). The SPA drives **all 4 CUJs in <1s**, **replayed via the Claude Preview/browser tools** (start dev server ? fill the ingest picker ? click through process/poll/RallyPicker ? assert the reel link via snapshot/network). Catches reload-survival (CUJ-2), the ``play_segments`` field-name bug (CUJ-3), capability honesty (CUJ-4).

- **L2 ? Engine-contract checks (real FastAPI, GPU-free).** Boot `python -m backend.main --server` with `storage=local` + `detector_impl=stub` + `skip_ai_handoff` and assert the mock and the real engine agree shape-for-shape2 (202 keys, jobs enum, result.play_segments` schema, compile `{status,filepath}`, highlights content-type). Every new endpoint is born with a mock handler and a real-engine contract test in the same PR2. Runs in CI.`
- **L3 ? Real local e2e (the MVP substrate).** Through the gate on the droplet: CUJ-1 with `stub` (key-free) and `gemini` (real, short clip to bound cost); the exposure-safety posture test (raw :8000`/:900x` refused from outside) as an assertion, not an assumption; reuse the `parity.yml` dual-host pattern.`
- **L4 ? CI regression (green gates merge).** `npm test` + a stub-engine contract job + headless browser-replay CUJ scripts; one small PR per tracker row off `origin/master`, no stacking; coverage at/above the floor; logs inspected during replay (S5).`
- **L5 ? Owner hardware e2e (handed off).** Native WASB **byte-parity** on a real GPU box; real-4K **golden-corpus** runs (Gemini + native); Modern-Standby/`cv2`-vs-`ffmpeg` behavior; a multi-GB browser upload. Reported back into S9, stated plainly as not verified in the offline suite.`

9. Deliverables & progress tracker ? **source of truth**

Legend: ? Todo · ? In progress · ? Done · ? Blocked/gated. **One small PR per row**, branched from `origin/master``, no stacking; CI green gates merge; coverage ? floor; each PR ships its tests + meaningful logs (S5).

ID	Deliverable	Depends on	Gated?	Status	PR
T0	This design doc + <code>docs/README.md`</code> + <code>NEXT_STEPS.md`</code> pointers	?	owner	?	(this PR)
T1	Mock engine + capability fixtures + browser-replay CUJ scripts (L1)	T0	no	?	?
T2	Appliance shell: Caddyfile + systemd units; firewall; edge auth ; rotate key (P1)	owner	?	?	?
T3	L3 live posture test (raw <code>:8000`/:900x` refused from outside)</code>	T2	no	?	?
T4	S1 ingest (local upload wired) + segmenter picker	T1	no	?	?
T5	S2 progress (poll + one-job + restart-failure)	T4	no	?	?
T6	S3 embed RallyPicker + compile + download	T4	no	?	?
T7	<code>(engine)* `GET /api/capabilities` + `GET /api/health` + banner</code>	T1	coord	?	?
T8	<code>(engine)* `GET /api/videos` + `GET /api/reels/{video_id}` (S4 reload-survival)</code>	coord	?	?	?
T9	S5 Settings (config+capabilities; disabled compute/storage target)	T7,T8	no	?	?
T10	Observability pass: correlation id end-to-end + structured logs + metrics (S5)	T4	no	?	?
T11	Retention sweep for <code>output/+`uploads/`</code>	owner	?	?	?
T12	Ingest from bucket URI (<code>s3://`/`gs://`)</code> wiring	T4	coord	?	?
T13	GPU host stand-up (provider-agnostic) + wire <code>detector_impl=native`</code> ; owner byte-parity (P4)	branch	?	owner	?
T14	<code>(reserved)* Bucket-worker bridge ? remote-GPU "compute as a setting" (P5)</code>	T8,T12	?	owner	?

Owner priority (2026-06-20): T13 (GPU host) is elevated to run in parallel from the start² ? owner provisions the host + token; the engine session lands native WASB; the UI MVP does **not** block on it (ships on Gemini).

10. Open questions ? owner / external

Blocking gates: (1) **edge-auth** ? Caddy basicauth (self-contained) vs cloudflared+Cloudflare Access (matches the two-host design, no inbound ports)? (2) **retention defaults** ? auto-delete originals after compile? keep proxies+intervals only? window? (privacy/consent). (3) **per-video Gemini/GPU cost ceiling** ? what cap, hard-fail vs warn? (4) **GPU host choice** ? DO GPU droplet / GCE GPU VM / Cloud Run+GPU (and is a containerized worker worth building for Cloud Run)? (5) **P5 bridge ownership** ? who builds the orchestration endpoint + how it coordinates with the active worker sessions.

Nice-to-knows: console home (web/ vs engine static); a review-playback streaming endpoint; per-user scoping timing; containerization vs runbook.

11. Definition of done

- [] CUJ-1 works end to end on the droplet (Gemini **and** stub) behind the gate, via the ingest menu.

- [] Raw `:8000`/`:900x` unreachable from outside (**tested**, not assumed).
- [] Local upload wired; bucket-URI ingest at least designed/tracked; Drive scoped honestly (not faked).
- [] RallyPicker embedded with honesty rules; `min\_shot\_count` surfaced.
- [] `/api/capabilities` + `/api/health` + banner truthful; reload-survival via `/api/videos` + `/api/reels`.
- [] **Observability:** correlation id threaded end-to-end; structured logs at every new path; loud failures; logs inspected during CUJ replay.
- [] Retention sweep in place; `GEMINI\_API\_KEY` rotated; `allowed\_video\_root` set.
- [] CI green (L2 contract + L4 regression); coverage ? floor; S9 tracker all ??-resolved.

Changelog

- 2026-06-20 ? Initial `DRAFT`. Consolidated three single-box-appliance designs (FastAPI-native / unified-origin / decoupled-profile) into the reverse-proxied unified-origin spine + compute-as-a-setting framing, via a multi-agent design pass; every engine-fact anchor re-verified against source before writing (catching the native-WASB partial-wiring + `ai\_max\_workers` default nuances). Folded in the owner's ingest-menu (Drive/bucket/local), multi-provider GPU, and first-class Observability directives.

190. assistant (2026-06-20T09:26:03.526Z)

Design doc shipped for review: **[khelsutra#13](<https://github.com/avidullu/khelsutra/pull/13>)**
? `DRAFT`, owner-gated, CI green, docs-only. Checkpoint recorded.

What it lands on

Recommendation: a reverse-proxied **unified origin** ? the ``web/`` SPA behind an **edge auth gate**, ``/api/`` proxied to the engine bound to ``127.0.0.1:8000``, so the no-auth/``CORS`` engine is **exposure-safe by construction** (the gate, not the app, is the boundary). It drives the **existing** FastAPI loop with ``storage=local``; **compute** is a setting, with the bucket/remote-GPU worker as the reserved scale path. It's the single-box profile of the decoupled architecture, not a competitor to it.

Your three clarifications are baked in: the ingest menu (local upload / bucket URI / Drive), provider-agnostic GPU (DO/GCE/Cloud Run, with the containerization caveat), GPU-host stand-up elevated to run **parallel** to the UI MVP (T13), and **Observability** as a first-class \$5 + DoD item. The CUJ/live-test plan is \$8 (5 layers, mock?contract?live?CI?owner-hardware).

Honesty refinements my verification caught (didn't trust the synthesis): native WASB is **partially** wired (``fusion_hybrid`` builds it, ``trajectory_hybrid`` refuses) and owner-parity-gated; ``ai_max_workers`` default is **5** not 1; the chunked-upload endpoints **exist** but ``app.js`` never calls them (so browser upload is client-wiring, no engine change).

Decisions I need from you (doc §10) ? with my recommended defaults

```
| # | Gate | My default |
|---|---|---|
| 1 | Edge auth | cloudflared + Cloudflare Access (no inbound ports, matches the two-host design; basicauth if you want a purely private box) |
| 2 | Retention of uploaded originals | keep proxies+intervals, sweep originals after compile (privacy/disk) ? needs your consent call |
| 3 | Per-video Gemini/GPU cost ceiling | hard cap + warn before non-owner exposure (no ledger exists today) |
| 4 | GPU host (the ASAP one) | DO GPU droplet in `sgp1` for the fastest path (co-located with Spaces, existing runbook); Cloud Run+GPU later for per-video economics once the worker is containerized |
| 5 | Who owns the P5 bucket-worker bridge | coordinate with the active decoupled/worker session (avoid the shared-checkout collision) |
```

Concrete next moves ? pick any (I'll start on your word)

- GPU-ASAP track:** I draft a **ready-to-run GPU provisioning runbook** (from the engine's ``SETUP_NEW_MACHINE`` + ``deploy/digitalocean/``) **+** a containerization feasibility check for Cloud Run/GCE ? so you can stand a host up in minutes. (Read-only; no spend. If you hand me a DO/GCP token + authorize the spend, I can drive it.)
- Build the per-rally MVP (P1)** ? the approved SPA scaffold + first screen, with live CUJ replay, since it's unblocked and rides existing endpoints.
- Appliance T1** ? the mock engine + browser-replay CUJ scripts (the hermetic dev loop), once you've eyeballed #13.

Given "GPU ASAP," I'd suggest **#1** in parallel with **#2**. Want me to go?

191. user (2026-06-20T09:29:01.868Z)

assume instead of a desktop app it spins up a webserver with UI and the user can either point to local storage + GPU / CPU or cloud locations and the UI should drive the tool. So GPU ASAP with DO as the first place to try out is very reasonable, now with gcloud you should also tell me if I can give you digital ocean access to create GPU VMs ?

192. assistant (2026-06-20T09:30:08.728Z)

This sharpens it nicely ? **a self-hosted webserver + UI (not a desktop app)** where the user points at local storage+GPU/CPU **or** cloud, and the UI drives the tool. That's exactly the appliance design; I'll make the "supersedes the desktop-app approach" explicit in the doc.

On your real question ? **yes, you can give me access to create GPU VMs, and I can drive it.** Let me first check what's already set up on this machine so my answer is grounded, not hypothetical.

193. user (2026-06-20T09:30:18.708Z)

```

=== doctl ===
doctl: NOT installed
=== gcloud ===
Google Cloud SDK 571.0.0
bq 2.1.32

    Credentialed Accounts
ACTIVE ACCOUNT
*      avi.dullu@gmail.com

To set the active account, run:
    $ gcloud config set account `ACCOUNT`
-- project --
gen-lang-client-0306026826
=== ssh key for droplet ===
do_rally key: absent
khelsutra_droplet key present

```

194. assistant (2026-06-20T09:31:07.141Z)

Grounded answer now possible. Key findings: ****`doctl` is NOT installed**** here, but ****`gcloud` is already installed and authenticated**** as you (`avi.dullu@gmail.com`, project `gen-lang-client-0306026826`). The `khelsutra_droplet` SSH key is present; the engine's `do_rally` key is not (the decoupled work ran from another machine).

Let me fold the "webserver+UI, not desktop app" lock and a provisioning-safety note into the doc (PR #13 is still in review), then give you the full access answer.

198. assistant (2026-06-20T09:31:39.430Z)

Pushed to PR #13. Let me capture the provisioning-access state in memory, then give you the complete answer.

199. user (2026-06-20T09:31:46.036Z)

The file `C:\Users\avidu\claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md` has been updated successfully. (file state is current in your context ? no need to Read it back)

200. assistant (2026-06-20T09:32:19.746Z)

Here's the complete, honest answer to your access question.

The reframe ? locked

"Webserver + UI the user spins up, points at local GPU/CPU or cloud, UI drives the tool" is now **D10** in the design (PR #13, just updated): it **supersedes the desktop-app plan**. Same one artifact runs on your box, a droplet, or a GPU host ? compute/storage are settings.

Can you give me access to create GPU VMs? **Yes ? and here's the safe way**

The mechanism is *authenticate the CLI on this machine yourself*, so I drive it **without the secret ever entering our chat**:

- **DigitalOcean** ? `doctl` is **not installed here** yet. To grant access:
 1. Install `doctl` (I can do this for you ? `winget install doctl` / download the binary), then
 2. **You** run `doctl auth init` and paste the token at its interactive prompt. After that I run `doctl compute droplet create ?` against the authenticated CLI.
- ?? **Do NOT** paste the DO API token into this chat ? it would be captured in the transcript. (Your DO Spaces key already had to be rotated after a chat exposure, per the engine handoff ? let's not repeat it.) Use a least-privilege token you can revoke after.
- **Google Cloud** ? `gcloud` is **already authenticated** here as you (`avi.dullu@gmail.com`, project `gen-lang-client-0306026826`). So I could drive **GCE / Cloud Run today** ? **but** I'd first need to verify **GPU quota + billing** on that project (it looks like an AI-Studio auto-project; GCP requires a GPU **quota grant**, which often isn't instant).

Guardrails I'll hold to (creating paid infra)

- **Confirm-first**, every time: I propose the exact command + **hourly cost + teardown plan**, you OK it, then I create. No silent spend.
- **Verify before promising**: DO **GPU Droplets** are H100-class ? pricey and region-limited (often NYC/TOR/ATL, maybe not `sgp1`/`blr1`); I'll check SKU/region/price via `doctl` rather than assume. Same for GCP GPU availability/quota.
- **Creds stay on-box** (0600), never in the repo; auto-stop so a GPU isn't billing 24/7.
- **Honest dependency**: creating the VM is necessary but not sufficient for *real* e2e ? the GPU box also needs the engine's **native WASB (M3.5)**, which is the decoupled session's in-flight work + an owner byte-parity gate. The CPU/Gemini MVP doesn't wait on any of this.

Recommended next step (you prefer DO first)

- Let me, in parallel and **without spending anything yet**:
1. **Install `doctl` for you** + write the exact `doctl auth init` step, so the moment you drop in a token I can **verify DO GPU SKU/region/price** and propose the create command for your OK.
 2. **Check GCP GPU quota + billing now** (gcloud is already authed ? read-only) so we know whether GCP is even a viable fallback.
 3. (Optional, parallel) **start the per-rally MVP P1** ? it's unblocked and needs no GPU.

Want me to do **1 + 2** now? Once `doctl` is authed, the GPU VM is a propose-then-confirm away.

201. user (2026-06-20T09:38:26.240Z)

please install doctl and I can auth and give you access with a budget cap

202. assistant (2026-06-20T09:39:02.165Z)

Installing `doctl` directly ? this is a one-shot mechanical install, so a multi-agent workflow would add nothing here; I'll do it and verify. (On the budget cap: DO has no hard per-resource spend cap, so the practical cap = we agree a ceiling, I propose-then-confirm each create with its hourly cost, and I auto-stop idle GPUs; I'll also set up a DO **billing alert** at your cap once I'm authed.)

Command line alias added: "doctl"
Successfully installed

208. assistant (2026-06-20T09:39:39.061Z)

`doctl` installed (alias added). Let me verify it's on PATH in a fresh shell:

209. user (2026-06-20T09:39:42.818Z)

doctl found at: C:\Users\avidu\AppData\Local\Microsoft\WinGet\Links\doctl.exe
doctl version 1.162.0-release
Git commit hash: 5d60ffcd

210. assistant (2026-06-20T09:40:04.987Z)

`doctl` v1.162.0 is installed and on PATH (`?\WinGet\Links\doctl.exe`). Let me update the
checkpoint, then hand you the auth step.

211. user (2026-06-20T09:40:09.178Z)

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-
indexer\memory\current-state.md has been updated successfully. (file state is current in your
context ? no need to Read it back)

212. assistant (2026-06-20T09:40:22.997Z)

? **doctl v1.162.0 installed and verified** (on PATH at `?\WinGet\Links\doctl.exe`).

Your move: authenticate (the one step that must be yours)

In **your own terminal** (not through me):

```
doctl auth init
```

It prompts for the token interactively ? **paste the token there, never into this chat.** Use a **least-privilege, revocable** Personal Access Token (DO classic PATs are read/write; create a dedicated one and delete it when we're done). You can sanity-check with `doctl account get`. After that, the authenticated CLI is on this box and I drive it without ever seeing the secret.

Budget cap ? how I'll enforce it

DO has no hard per-resource spend ceiling, so the cap is enforced operationally:

- Tell me the cap (e.g. **max \$/hr** for the GPU and/or a **monthly ceiling**).
- I'll set a **DO billing alert** at that threshold once authed (the closest native guardrail).
- **Propose-then-confirm every create** ? I show you the exact `doctl` command + its hourly cost before running it, and **auto-stop/destroy idle GPUs** so nothing bills silently.

The moment you've authed, I'll (read-only first, no spend):

1. **Verify GPU reality** ? `doctl compute size list / region` availability + price. DO's GPU droplets are H100-class and region-limited (often not `sgp1/blr1`), so I'll confirm SKU/region/price **before** proposing anything ? no assumptions.
2. Propose the **exact create command within your cap** for your explicit OK, then provision + run the engine's GPU runbook (`mount_scratch ? bootstrap --gpu ? gpu_setup`) and coordinate the native-WASB wiring with the engine session.

Want me to also, in parallel right now: **(a)** draft the DO GPU provisioning runbook from the engine's `deploy/digitalocean/` scripts (read-only, so we move instantly once authed), and/or **(b)** kick off the **per-rally MVP P1** (unblocked, no GPU needed)? Just say go.

213. user (2026-06-20T09:42:30.283Z)

verified and I recommend focus on the DO for now and lets get it into a completely e2e working with upload/gdrive/S0 Bucket upload and reel generation with customizations

214. user (2026-06-20T09:43:12.387Z)

[Request interrupted by user]

215. user (2026-06-20T09:43:12.397Z)

yes per rally MVP P1 now! and keep merging PRs with the code and test guidances

216. assistant (2026-06-20T09:46:43.979Z)

On it ? building **per-rally MVP P1** (the `web/` SPA scaffold + typed API client), as an isolated PR with tests, typecheck, build, and the observability seed (correlation IDs) per the launch quality bar. This is a cohesive mechanical build I need to compile/run/verify locally, so I'm doing it directly rather than fanning out ? I'll reserve Workflows for the parallelizable later screens/reviews.

Let me cut the branch off `origin/master` and scaffold.

217. user (2026-06-20T09:46:49.406Z)

branch 'feat/web-spa-scaffold' set up to track 'origin/master'.

Switched to a new branch 'feat/web-spa-scaffold'

feat/web-spa-scaffold

eeb8a48 ci(site): add deploy-config + static-asset guards and a live-parity workflow (#12)

v26.1.0

11.13.0

218. assistant (2026-06-20T09:48:04.934Z)

I'm on a clean `feat/web-spa-scaffold` branch off `origin/master` (Node 26, npm 11). I'll keep this PR's doc footprint to `PER\_RALLY\_SELECTION.md`'s tracker only (no `README`/`NEXT\_STEPS` edits) so it can't conflict with the open appliance PR #13. Writing the scaffold:

243. assistant (2026-06-20T09:49:12.686Z)

web/ ? KheIsutra Studio (operator console SPA)

Vite + React + TS + Tailwind v4. The browser UI that **drives the rally indexer engine**: upload ? index ? pick rallies ? reel ? download. See `docs/PER\_RALLY\_SELECTION.md` (the per-rally curation screen) and `docs/LOCAL\_APPLIANCE\_ARCHITECTURE.md` (the single-box appliance this SPA fronts).

Dev

...

```

npm install
npm run dev      # http://localhost:5173 ; proxies /api ? http://localhost:8000 (the engine)
...

```

Run the engine alongside it: `python -m backend.main --server` (in the badminton-highlight-indexer repo). The SPA uses **same-origin** relative `/api/\*` calls ? in the appliance a reverse proxy serves this bundle and proxies `/api` to the engine on `127.0.0.1:8000`.

Checks (CI gates merge)

...

```

npm run typecheck # tsc --noEmit
npm run test      # vitest run (unit tests; e.g. the typed API client)
npm run build     # vite build
...

```

Layout

- `src/api/client.ts` ? typed engine client (`listRallies` / `compileReel` / `highlightUrl` / `getConfig`), grounded in the verified engine contract; every call carries a correlation id.
- `src/api/types.ts` ? engine data types (honest: `server`/`receiver`/`events` are motion-only fabrications and must not be surfaced).
- `src/lib/log.ts` ? structured client logging + correlation ids (observability seed, appliance \$5).
- `src/App.tsx` ? the console shell (screens land in M2+).

244. user (2026-06-20T09:49:12.719Z)

The file C:\Users\avidu\Projects\kheIsutra\web\README.md has been updated successfully. (file state is current in your context ? no need to Read it back)

256. user (2026-06-20T09:51:16.914Z)

```
[
  {
    "serverId": "46ce8500-be60-40b3-8b92-075268e8bd92",
    "name": "landing",
    "port": 8099,
    "status": "running",
    "startedAt": "2026-06-20T09:50:58.108Z",
    "cwd": "C:\\Users\\avidu\\Projects\\badminton-highlight-indexer"
```

```
}  
]
```

257. assistant (2026-06-20T09:51:59.794Z)

The preview tooling is anchored to the session's primary cwd (the *indexer* repo), so it started that repo's "landing" config, not my Vite app. Let me check the indexer's launch config and point one at the khelsutra web app (absolute path), so the live render works.

258. user (2026-06-20T09:51:59.881Z)

```
1      {  
2          "version": "0.0.1",  
3          "configurations": [  
4              {  
5                  "name": "landing",  
6                  "runtimeExecutable": "python",  
7                  "runtimeArgs": ["-m", "http.server", "8099", "--directory", "artifacts/landing"],  
8                  "port": 8099  
9              }  
10         ]  
11     }  
12
```

259. assistant (2026-06-20T09:52:12.575Z)

I'll add a `khelsutra-web` config (absolute path to the web app) to the indexer's launch.json ? it's local/gitignored and additive, so it won't affect the active sessions' "landing" config ? and stop the stray server.

260. user (2026-06-20T09:52:15.903Z)

The file C:\Users\avidu\Projects\badminton-highlight-indexer\.claude\launch.json has been updated successfully. (file state is current in your context ? no need to Read it back)

261. user (2026-06-20T09:52:16.526Z)

Server 46ce8500-be60-40b3-8b92-075268e8bd92 stopped

262. user (2026-06-20T09:52:22.332Z)

265. assistant (2026-06-20T09:52:39.526Z)

The React app mounts and renders correctly through Vite (header, heading, feature list all present). Let me confirm a clean console and grab a visual:

266. user (2026-06-20T09:52:40.960Z)

No console logs.

267. assistant (2026-06-20T09:53:02.990Z)

Renders perfectly ? branded header, green pill, heading, feature list ? and **zero** console warnings/errors. The full Vite + React 19 + TS + Tailwind v4 stack works end to end. Let me stop the server and wire CI + the tracker (reading the files first for exact edits).

268. user (2026-06-20T09:53:03.540Z)

Server 562aa207-509e-4150-af4b-bab7878eb67f stopped

269. user (2026-06-20T09:53:04.463Z)

20           #   src/server.test.js -> boots server.js (node:http + node:sqlite) and round-
trips it
21           - run: npm test
22
```

270. user (2026-06-20T09:53:05.275Z)

```
86      | `GET /api/videos` | List a user's videos for a Match picker (only `get_video(id)`
exists, `database.py:418`) ? needs DB enumerate + identity scoping | **new** |
87      | `GET /api/videos/{video_id}/source` (Range) *or* `/clip?start=&end=` | Stream
source/per-span video so a rally previews before selection ? neither exists | **new** |
88      | `GET /api/videos/{video_id}/rallies/{segment_id}/thumbnail` | Per-rally poster still
(no thumbnail column; WASB frames are transient) | **new** |
89      | `PATCH /api/segments/{id}` | Persist accept/reject/nudge ?
`candidate_segments.human_label/notes/...` (columns exist, unwritten ? corpus loop) | **new** |
90
91      **? Dead-ends / do-NOT:** never surface `server`/`receiver`/`events` (motion-only
randoms `[motion.py:191-198]`); never consume shot-type/player/score (no data); never render a
confidence **meter** ? `shot_count_confidence` is a Gemini *string* (often `"Unknown"`) and
`play_segments` has **no** numeric confidence column.
92
93      ## 5. Risk table
94      | Risk | Severity | Mitigation |
95      |---|---|---|
96      | **No source/clip/frame/thumbnail endpoint** ? only compiled reels stream
`[main.py:307-328]` | High (UX) | MVP selects on text metadata + previews the *final* reel;
preview/timeline deferred to M3 behind a new endpoint |
97      | `min_shot_count` silently drops selected rallies `[main.py:362-383]` | High (looks
broken) | Footer warns *before* Build; D7 makes selection explicit; an override is an owner gate
(Launch-Report-worthy `[memory: launch-report-convention]`) |
98      | No match-duration field ? a timeline must derive `total = max(end_time)`, mis-
rendering pre/post dead air | Med | Timeline deferred to M3; never over-promise it as a true
```

```
scrubber until source streams |
99      | `shot_count` is an *estimate* (`shuttle_exchange_count` w/ `max(3,int(dur/0.8))`
fallback) `[gemini.py:470-485]` | Med | Label "approx."; confidence shown as the raw string, not
a meter |
100     | No auth / user scoping anywhere (CORS `*`, `videos.user_id` never set/filtered) | High
for multi-tester | Fine for single-box local alpha; a ship-blocker for any shared host ? gate
`GET /api/videos` behind PR-3 scoping |
101     | compile returns a filepath not a URL `[main.py:394]` | Low | Client builds the URL for
MVP; `download_url` field (M1) removes the brittleness |
```

106
107     ## 7. Deliverables & progress tracker ? **source of truth**
108     Legend: ? Todo . ? In progress . ? Done . ? Blocked/gated. **One small PR per row**,
branched from `origin/master`, no stacking. CI (`npm test`) must stay green; merge to `master`
auto-deploys the site (docs/`web/` changes don't touch the live `site/` Worker).
109
110     | ID | Deliverable | Depends on | Gated? | Status | PR |
111     |----|-----|-----|-----|-----|----|
112     | P0 | This design doc + `docs/README.md` + `NEXT_STEPS.md` pointers | ? | No | ? |
[11](https://github.com/avidullu/khelsutra/pull/11) |
113     | P1 | SPA scaffold (Vite+React+TS+Tailwind) in `web/` + typed API client; dev proxy to
engine `:8000` | P0 | No | ? | ? |
114     | P2 | RallyList/Grid (honest fields only) + `useRallySelection()` hook (unit-tested) |
P1 | No | ? | ? |
115     | P3 | `parseQuery()` + parsed-pill + example chips (unit-tested; greys out unavailable
tokens) | P2 | No | ? | ? |
116     | P4 | SelectionFooter + `min_shot_count` warning (from `GET /api/config`) | P2 | No | ?
| ? |
117     | P5 | Build ? `POST /api/compile` ? client-built download URL + `` preview of
the reel | P2 | No | ? | ? |
118     | P6 | *(engine repo)* `GET /api/health` + offline banner; `/api/compile` returns
`download_url` | ? | No | ? | ? |
119     | P7 | *(engine repo)* `GET /api/videos/{id}/rallies` RESTful alias | ? | No | ? | ? |
120     | P8 | *(engine repo)* `GET /api/videos` + PR-3 identity scoping ? A1 Matches screen |
P7 | ? owner | ? | ? |
121     | P9 | *(engine repo)* source/clip stream + timeline + per-rally preview/thumbnail | P8
| ? owner | ? | ? |
122     | P10 | *(engine repo)* `PATCH /api/segments/{id}` corpus loop (PR-4/B6) ? A4 Rally
Review | P9 | ? owner | ? | ? |
123
124     **Milestone rollup:** **M0/MVP = P1?P5** (pick?reel on existing API, zero new engine
endpoints) . **M1 = P6?P7** (RESTful + reliability polish) . **M2 = P8** (multi-video home) .
**M3 = P9** (per-rally preview/timeline) . **M4 = P10** (corpus correction loop) . **M5** = swap
`parseQuery()` for localized NL behind the same seam (gated on shot/player data landing).
125
126     ## 8. Open questions ? owner / external
127     **Blocking gates ? ? RESOLVED 2026-06-20 (owner) ? see D8?D11 in §2:**
```

272. assistant (2026-06-20T09:53:18.150Z)

Both files read. Updating the tracker (P1 ? done) and adding the `web` CI job (typecheck ? test ? build, gated on a committed lockfile):

273. user (2026-06-20T09:53:20.248Z)

The file C:\Users\avidu\Projects\khelsutra\docs\PER_RALLY_SELECTION.md has been updated successfully. (file state is current in your context ? no need to Read it back)

274. user (2026-06-20T09:53:28.894Z)

The file C:\Users\avidu\Projects\khelsutra\.github\workflows\test.yml has been updated successfully. (file state is current in your context ? no need to Read it back)

275. assistant (2026-06-20T09:53:37.936Z)

Now commit (explicit paths; `web/.gitignore` excludes `node\_modules`/`dist`, lockfile included for `npm ci`):

276. user (2026-06-20T09:53:40.796Z)

```

285. assistant (2026-06-20T09:55:22.305Z)

P1 merged (`aac7e0c`), master synced. Only open PR is #13 (the appliance design doc, awaiting your review). Let me update the checkpoint.

286. user (2026-06-20T09:55:28.477Z)

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md has been updated successfully. (file state is current in your context ? no need to Read it back)

287. assistant (2026-06-20T09:55:51.098Z)

? **Per-rally MVP P1 shipped and merged ?**
[khelsutra#14](https://github.com/avidullu/khelsutra/pull/14). **master at `aac7e0c`.**

What landed (isolated PR, per the quality bar)

- **web/` SPA scaffold** ? Vite 6 + React 19 + TS + Tailwind v4; dev proxy `/api ? :8000` (same-origin in the appliance).
- **Typed engine API client** (`web/src/api/client.ts`) ? `listRallies` / `compileReel` / `highlightUrl` / `getConfig` + `minShotCount`, grounded in the **verified** contract. Honest types flag `server`/`receiver`/`events` as motion-only fabrications.
- **Observability seed** (`web/src/lib/log.ts`) ? structured logs with a **correlation ID** threaded into every request (`x-correlation-id`) and logged on entry/result/error; loud failures, never silent (per appliance S5 + the launch quality bar).
- **Tests + CI** ? 8 vitest cases on the client logic; a new **web` CI job** (`npm ci` ? typecheck ? test ? build) with a committed lockfile gating the merge.

Verified (live, not assumed)

typecheck clean . **8/8 tests green** . `vite build` OK . and I ran the Vite dev server and **confirmed the shell renders in-browser with zero console errors** (snapshot + screenshot). CI re-proved all of it on a clean Node 24 runner.

Where things stand

- **Open:** [khelsutra#13](https://github.com/avidullu/khelsutra/pull/13) ? the appliance design doc, **awaiting your review** (\$10 decisions are yours).
- **GPU/D0:** `doctl` is installed and ready ? whenever you run `doctl auth init` (token at the prompt, **not in chat**) + give me a budget cap, I'll verify GPU SKU/region/price and propose the create command.

Next: P2

RallyList/Grid (honest fields only) + the `useRallySelection()` hook, unit-tested, with **browser CUJ replay** against a mock engine (and a real local engine where possible) ? exactly

the live-testing loop you asked for. Same cadence: one isolated PR, its own tests, observability, merged on green.

Want me to **go straight into P2** now, or pause here so you can review #13 / kick off the DO auth first?

288. user (2026-06-20T09:55:57.357Z)

please make sure to do the real testing on a GPU VM and do not kill it, if you can move the local site running on srv/ of the current droplet to the new GPU VM and delete the old droplet. And post that I want you to plan integrating the rally-annotator in this UI by making dediucated pages as to how a user can annotate and train their own model as a USP of this product and point to the github and maybe add a few screenshots and also help user set it up and use.

289. assistant (2026-06-20T09:57:02.354Z)

This is a big, multi-part request with some **genuinely destructive and cost-bearing steps** ? so before I touch anything, let me check the actual state (is `doctl` authenticated? is the annotator repo here?) and flag the risks honestly, because one step as written could destroy another session's work.

290. user (2026-06-20T09:57:08.146Z)

292. assistant (2026-06-20T09:58:47.451Z)

Key facts: **`doctl` is authenticated** (team "Khelsutra Guru", droplet limit **3**), and **rally-annotator is local + public** (`github.com/avidullu/rally-annotator`` ? a VLC plugin that hand-labels rally start/end ? CSV). Before I touch infrastructure, two things must be grounded: the

real GPU cost (you said "don't kill it" = continuous billing) and the ****droplet-deletion risk****.
Let me verify the DO GPU reality:

293. user (2026-06-20T09:58:53.173Z)

```
Exit code 1
=== current droplets (limit 3) ===
Error: unknown column "Size"

=== GPU sizes (slug / hourly / monthly / regions) ===
```

294. assistant (2026-06-20T09:59:03.598Z)

Column name fix:

295. user (2026-06-20T09:59:08.218Z)

```
Exit code 1
=== current droplets ===
ID           Name                Region  Size Slug                Status  Public IPv4
579001481    claude-do-rally-test    blr1    s-2vcpu-4gb-120gb-intel  active
168.144.126.176

=== GPU sizes ===
=== (header) ===
Error: unknown column "Available"
```

296. assistant (2026-06-20T09:59:22.268Z)

The `Available` column was invalid (so the GPU filter command errored, not "no GPUs"). One droplet exists (`claude-do-rally-test`, blr1, CPU) ? 2 slots free. Re-checking GPU sizes with valid columns:

297. user (2026-06-20T09:59:27.031Z)

```
=== total sizes + any gpu-ish ===
count: 17
```

298. assistant (2026-06-20T10:00:44.381Z)

****Critical finding: DO has no GPU sizes on this account.**** The catalog returns only 17 sizes, none GPU (no `h100`/`l40`/`a100`/`l4`/`gpu` slugs). DO GPU Droplets are access-gated and region-limited (NYC/TOR/ATL, not `blr1`) ? so I ****cannot provision a DO GPU VM right now****; that needs GPU access enabled on the account. Let me check the GCP path (gcloud is authed) and, in parallel, start the rally-annotator integration design you asked for (it's unblocked).

299. user (2026-06-20T10:00:48.208Z)

```
Exit code 2
=== GCP project + GPU quota (is Compute usable?) ===
ERROR: (gcloud.compute.project-info.describe) unrecognized arguments:
--filter=quotas.metric:GPUS_ALL_REGIONS (did you mean '--flatten'?)
```

To search the help text of gcloud commands, run:
gcloud help -- SEARCH_TERMS

300. user (2026-06-20T10:01:04.691Z)

```
"metric": "GPUS_ALL_REGIONS",
```

301. assistant (2026-06-20T10:01:14.441Z)

GCP Compute API is enabled and a GPU quota metric exists. Let me read its limit:

302. user (2026-06-20T10:01:18.806Z)

```
"limit": 0.0,  
> "metric": "GPUS_ALL_REGIONS",  
  "usage": 0.0
```

303. assistant (2026-06-20T10:02:08.985Z)

****Second blocker: GCP GPU quota is 0**** (`GPUS\_ALL\_REGIONS` limit: 0.0). So ****neither provider can spin up a GPU VM right now**** ? DO needs GPU access enabled (region-gated, not `blr1`), GCP needs a quota-increase request. Both are ****owner-initiated, provider-approved**** steps I can't do via CLI. This changes the plan materially. Let me start the (unblocked) rally-annotator integration design now, then lay out the GPU reality and the safe path.

304. user (2026-06-20T10:03:00.447Z)

Workflow launched in background. Task ID: w67h67tbl
Summary: Design the rally-annotator integration + "train your own model" USP pages for the Studio UI: dedicated annotate/train/setup pages, GitHub link, screenshots, honest scoping. Grounded in the real annotator + engine train loop.
Transcript dir: C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\144a31b7-7962-4fee-9d6f-8a7854daa63f\subagents\workflows\wf_887fb14e-e6d

305. assistant (2026-06-20T10:03:34.060Z)

Both GPU paths are blocked on access/quota requests ? I can't conjure a GPU VM via CLI. Let me record this honestly in the checkpoint, then lay out the safe path and get your call.

306. user (2026-06-20T10:03:41.410Z)

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md has been updated successfully. (file state is current in your context ? no need to Read it back)

307. assistant (2026-06-20T10:04:14.736Z)

Here's the honest situation and the safe path.

? The GPU VM can't be created right now ? both providers are gated

- ****DigitalOcean:**** the account's catalog has ****no GPU sizes at all**** (17 CPU-only sizes). DO GPU Droplets are access-gated and only in NYC/TOR/ATL ? not `blr1`. Needs GPU access enabled on the account.
- ****GCP:**** Compute API is on, but ****`GPUS\_ALL\_REGIONS` quota = 0**** ? needs a quota-increase request.

Both are ****owner-initiated, provider-approved**** steps (a console request, then their approval) ? I can't do them via CLI. So I can't spin up the GPU VM, run real GPU testing, or migrate-and-delete this turn.

? I will not delete the old droplet

`claude-do-rally-test` (168.144.126.176) is the ****shared decoupled-session testbed**** ? it hosts that session's engine (`~/rally`), MinIO, the GCS emulator, and the validated DO Spaces e2e. ****Deleting it would destroy their work.**** It's also moot until a GPU VM actually exists. So: no deletion without explicit confirmation ***and*** coordination with that session ? and only after the new VM is proven.

? What's actually unblocked

- ****Real product e2e (upload ? index ? reel) needs no GPU**** ? the engine's ****Gemini**** path produces real rallies with just the API key. So I can do real end-to-end CUJ testing of the MVP ***now*** (on the CPU droplet or locally). The GPU is only needed for the ****owned/native-WASB model**** + the ****train-your-own-model USP**** (which also still depends on the engine session's in-flight `NativeWasbRunner`).
- You also already have a ****Windows + WSL GPU box**** (where the decoupled session validated real WASB) ? usable for real native-detection testing today, no cloud VM required.
- ****The rally-annotator "train your own model" USP design is already running**** (background workflow) ? I'll deliver that tracked doc regardless of the GPU situation.

Two decisions will steer my next moves:

308. user (2026-06-20T12:49:43.738Z)

Your questions have been answered: "Both DO and GCP are GPU-gated (need an access/quota request you initiate). How do you want to pursue the hosted GPU VM?"="Use my Windows+WSL GPU box for now", "The real product loop (upload?index?reel) works via Gemini with NO GPU. Run real e2e testing via Gemini now (it incurs Gemini API cost)?"="No ? wait for the GPU VM". You can now continue with these answers in mind.

309. assistant (2026-06-20T12:50:44.454Z)

The owner chose: ****use the Windows+WSL GPU box (defer the cloud VM)**** and ****wait ? no Gemini e2e****. So I'm standing down on all the risky/blocked infra: ****no cloud GPU provisioning, no Gemini e2e run, no droplet migration/deletion.**** Real WASB e2e will happen on your Windows+WSL box (this machine) when we deliberately run it.

Meanwhile the ****rally-annotator "train your own model" design workflow finished**** ? let me pull its synthesis and verify the load-bearing claims (the annotator?CSV?train loop is the crux).

```
130      },
131      "synth": {
132          "annotate_to_model_flow": "The end-to-end loop (cwd labels = ANNOTATE in rally-
annotator repo; everything else = badminton-highlight-indexer engine):\n\n1) ANNOTATE [verified,
REAL today]: A human opens a match video in VLC 3.0.x with the `rally_annotator.lua` extension
enabled (View ? Rally Annotator), picks Sport, and per rally clicks Mark START (snapshots
playback time, micros/1e6?s ? rally_annotator.lua:201-207, 608-620), Mark END (622-628), an
Ending reason, optional shot count, then Save Rally (630-671). The tool appends ONE row per
rally and atomically rewrites `<video-stem>.rallies.csv` NEXT TO the video (HEADER line 128;
resolve_out_path 253-267; save_all temp+rename 310-335). No compute, no GPU, no LLM ? labels
never leave the user's machine.\n\n2) STAGE [verified path, manual/CLI]: Register/curate the
labels ? `python -m src.cli.curate import-local --sport badminton --video-path match.mp4
```

--annotations-path match.rallies.csv` (rally-annotator/docs/CSV\_FORMAT.md:41) ? and/or populate a corpus prefix with `labels/` (the .rallies.csv files), and for REAL trajectories `videos/` (byte-identical source) + `manifest.json`. Bucket layout `videos/ labels/ manifest.json weights/ outputs/<video_id>/` (SETUP_NEW_MACHINE.md:242; 04-BUILD-AND-TEST-PLAN.md:57-66). The MD5-keyed video?label join + stem-match is the contract (02-COMPUTE-MAP-AND-CONTRACT.md:48-60; __main__.py:271-275,280).\n\n3) TRAIN [PARTLY real ? default synth is plumbing-only; real trajectories are GPU/native-WASB-gated]:\n - Default (GPU-FREE CPU mock): `python -m backend.worker train --corpus-uri gcs://<bucket> --out-uri gcs://<bucket> --version 0.1.0` (default `--trajectory-source synth`). Pulls `labels/`, runs `synth\_trajectory\_from\_labels()` which reads row["start_time"]/row["end_time"] and emits a deterministic Frame,Visibility,X,Y trajectory that ENCODES the labels (stub_runner.py:124-149), shells out (the one-way train/serve wall, training/README.md:9-11) to `python -m training.gen0.harness` (__main__.py:321-328), pushes the bundle to `weights/<version>/` (333-340). Needs ?2 labeled videos for leave-one-video-out (258). This validates the WHOLE pipeline but the learned model is meaningful for PLUMBING only, NOT production (stub_runner.py:131-133). [verified end-to-end GPU-free 2026-06-20 in SETUP_NEW_MACHINE.md verification log: 922 passed/11 skipped; S3/GCS/MinIO round-trips.]

- Real (M3.5, GPU-gated, IN-FLIGHT): add `--trajectory-source detector --segmenter wasb\_hybrid` with `indexing.detector\_impl=native`. Pulls `videos/` too, ffprobes fps/width (skips on probe miss, 293-296), runs the real WASB DetectorRunner ? real trajectory CSV (298). Needs a GPU box + native WASB env + `wasb\_badminton\_best.pth.tar`. The LinuxNativeRunner does NOT exist yet (02:15; 04:98-113) ? until it lands real trajectories only work via the existing Windows+WSL path.\n\n4) HARNESS ? BUNDLE [verified]: For each spec, parse trajectory + load GT via `load\_gt\_intervals` ? build frame features (backend/features/rally_seq) ? honest LOVO eval ? fit FINAL LogisticRegression (~1M params, CPU, minutes) + tune threshold train-side ? run the SHIP-GATE ? emit the artifact bundle `<out>/<version>/weights.json` (classifier + frozen normalization + calibration) + `manifest.json` (reviewable contract: feature-schema, calibration, training lineage + GT hashes, eval, attestations incl. `no\_paid\_llm\_training\_labels:True`, gate verdict). Serving consumes ONLY the bundle, never a code import (ADR-008; harness.py:11-21, 78-98, 154-199, 192).\n\n5) USE [researched/design, owner-gated]: If Gen-0 clears the ship-gate A/B, the versioned bundle becomes the rally/highlight extractor driving the existing record?upload?reel loop. The ship-gate currently FORCES ship=False regardless of F1 (harness.py:133): WASB checkpoint provenance C3 UNRESOLVED ? commercial ship refused; F1@tIoU target not yet calibrated (issue #172). No per-user serving UI exists; no Studio "Train now" button exists. Training is an offline CLI.\n\nHONEST headline: the ANNOTATE half is real and shipping (v1.6.4 MIT plugin); the TRAIN half is an open, inspectable CLI pipeline in active build whose REAL (non-mock) model needs a GPU + the in-flight native WASB runner and an unresolved checkpoint-provenance gate. Studio pages must NOT imply one-click training exists today."

133 "schema_bridge": "MATCHES ? the rally-annotator output CSV is directly ingestible by the engine's TRAIN path with NO transform; the only real prerequisite is an IDENTITY/JOIN constraint, not a schema gap.\n\nANNOTATOR WRITES (rally_annotator.lua:128; CSV_FORMAT.md:6):\n Header: rally_number,start_time,end_time,ending_reason,sport,shots_count\n Row: 1,8.800,11.500,winner,badminton,9 (start_time/end_time = %.3f decimal seconds, end>start)\n\nENGINE READS BY COLUMN NAME via two readers; both are satisfied by the annotator header:\n A. Default synth train path ? `synth\_trajectory\_from\_labels` uses csv.DictReader and reads literally row["start_time"] and row["end_time"] (stub_runner.py:139). The annotator header contains BOTH names by exact spelling ? MATCHES exactly. Extra columns (rally_number/ending_reason/sport/shots_count) are simply not read. NO transform. (Note: this DictReader path requires the *_time names specifically ? the short start/end alias is NOT accepted here.)\n B. Canonical GT reader ? `load\_gt\_intervals` accepts EITHER `start`/`end` OR `start\_time`/`end\_time` header naming, ignores all other columns, also accepts headerless positional col0,col1, tolerates decimal seconds or MM:SS/HH:MM:SS, BOM/utf-8-sig, blank lines and `#` comments (gt_loader.py:14-18,30-31,44-90). The annotator file MATCHES the *_time branch. NO transform.\n\nCONTRAST (not a gap): the worker's OWN inference output CSV writes header `start,end,shot\_count,ending\_reason` (__main__.py:62-74) ? column ORDER and the short start/end naming differ from the annotator, but order never matters (both readers map by name) and gt_loader accepts both aliases. The annotator's *_time form is the SAFER of the two because it satisfies the strict DictReader synth path that the worker self-output's `start/end` would NOT.\n\nTHE ONE REAL PREREQUISITE (IDENTITY/JOIN, [verified]): training keys video?label by file MD5 and matches `labels/<name>.rallies.csv` to `videos/<name>.<ext>` BY STEM (__main__.py:271-275,280; 02-COMPUTE-MAP-AND-CONTRACT.md:48-60). So (a) corpus filename stems must agree, and (b) the staged video bytes must be byte-identical to what was annotated ? ANY re-encode changes the MD5 and breaks the join. The collector export manifest currently omits an `md5` field ? flagged as an M2 prerequisite (02:62-68). shots_count blank rows are irrelevant (column unused by training)."

```

134     "setup_runbook": [
135         "STEP 0 ? Prerequisites [verified]: VLC 3.0.x ONLY (the Lua input/listener API
changed in VLC 4.0; rally-annotator README.md:35). A match video captured per the existing one-
page capture checklist (site/public/capture.html ? fixed tripod, full court, landscape, whole
session). For REAL training: a GPU box with native WASB; for a dry run, the CPU-mock synth path
needs no GPU. End users do NOT need Lua installed (developers running the test suite need Lua
5.1).",
136         "STEP 1 ? Install the VLC plugin [verified, README.md:26-35]: copy the single
file vlc/rally_annotator.lua into VLC's per-user Lua extensions folder (create it if missing):
Windows %APPDATA%\vlc\lua\extensions\ ; macOS ~/Library/Application
Support/org.videolan.vlc/lua/extensions/ ; Linux ~/.local/share/vlc/lua/extensions/ . Then VLC ?
Tools ? Plugins and extensions ? Reload extensions (or restart VLC). No package manager, no
build step, zero runtime deps.",
137         "STEP 2 ? Enable + confirm version [verified]: in VLC, View menu ? Rally
Annotator; a small dialog opens and stays open while you watch. Confirm the build via Tools ?
Plugins and extensions ? Active Extensions, which shows the title with the version baked in,
e.g. 'Rally Annotator v1.6.4' (rally_annotator.lua:90-97). Use the in-dialog Help button for
usage + the ending-reason guide (VLC's own About box cannot be set by an extension).",
138         "STEP 3 ? Record [verified]: reuse the capture checklist at /capture
(site/public/capture.html) ? fixed tripod, full court, landscape, whole session. Link to it; do
not duplicate.",
139         "STEP 4 ? Annotate [verified, README Use + callbacks]: open the video in VLC
FIRST, then enable the extension (so the CSV is written next to the right video; if enabled
first it lazily adopts <video>.rallies.csv on first Mark START). Use the built-in Back 5s /
Play-Pause / Fwd 5s row to scrub. Per rally: pause on the serve-contact frame ? click Mark
START; pause on the shuttle-dead frame ? click Mark END; pick Ending reason (defaults to
'unknown'); optional Number of shots; click Save Rally to write ONE CSV row. This is a CLICK-
driven dialog ? there are NO keyboard hotkeys (S/E/1-6/U are roadmap only); say 'click the
buttons', never 'press S'. Edit selected / Delete selected / Undo last to fix; the v1.6.4
unsaved-work guard refuses a new Mark START or Edit while a rally is armed-but-unsaved.",
140         "STEP 5 ? Output CSV [verified, CSV_FORMAT.md]: the plugin auto-writes <video-
stem>.rallies.csv next to the video, columns
rally_number,start_time,end_time,ending_reason,sport,shots_count (decimal seconds, appended
live, atomic rewrite). Re-open the same video + enable the extension to reload existing rallies
and continue numbering. This is the LIGHTER schema; the richer Roora golden-set schema is a
separate vendor spec ? keep them distinct and do not present Roora-only fields as plugin
output.",
141         "STEP 6 ? Register / stage labels [verified path, CLI]: register as curated
golden data with `python -m src.cli.curate import-local --sport badminton --video-path match.mp4
--annotations-path match.rallies.csv`, and/or populate a corpus prefix with labels/ (the
.rallies.csv files) and, for real trajectories, byte-identical videos/ + manifest.json. The MD5
+ stem join is the contract: do NOT re-encode the video after annotating or the join breaks.",
142         "STEP 7 ? Train, GPU-FREE dry run (DEFAULT synth, CPU mock) [verified]: `python
-m backend.worker train --corpus-uri gcs://<bucket> --out-uri gcs://<bucket> --version 0.1.0`
(default --trajectory-source synth). Needs ?2 labeled videos (LOVO), the storage extra (`pip
install -e .[storage-s3]` or `[storage-gcs]`) + creds, no GPU. Validates the whole pipeline; the
model is plumbing-meaningful only. Local alternative: `python -m training.gen0.harness
--manifest <manifest.json> --floor eval_baselines/heuristic_lovo_n6.json --out
artifacts/rally_tal_gen0 --version 0.1.0`.",
143         "STEP 8 ? Train, REAL trajectories (M3.5, GPU/native-WASB-gated, IN-FLIGHT)
[verified gate]: `python -m backend.worker train ... --trajectory-source detector --segmenter
wasb_hybrid` with indexing.detector_impl=native. Needs videos/ in the corpus, a GPU + native
WASB env (gpu_setup.sh) with wasb_badminton_best.pth.tar present. The native LinuxNativeRunner
is not landed yet; until then real trajectories only work via the existing Windows+WSL path. The
ship-gate also forces ship=False (unresolved WASB checkpoint provenance C3; uncalibrated F1
target #172) ? present this as direction, not a shipped product.",
144         "STEP 9 ? Use the model [researched/design, owner-gated]: train pushes a
versioned bundle to weights/<version>/{weights.json,manifest.json}; if Gen-0 clears the ship-
gate A/B it becomes the rally/highlight extractor for the existing record?upload?reel loop. No
per-user serving UI and no Studio 'Train now' button exist ? training is an offline CLI."
145     ],
146     "screenshot_plan": [
147         "CARDINAL RULE [verified]: the rally-annotator repo contains ZERO committed
images (git ls-files = LICENSE, README, CHANGELOG, docs markdown, the Lua file, tests only).
There are NO existing annotator screenshots to reuse ? every screenshot below is TO-CAPTURE.

```

NEVER fabricate, AI-generate, or mock up a UI screenshot; use a labeled 'screenshot-to-be-captured' placeholder until a real one exists.",

148 "TO-CAPTURE 1 (install): the OS file explorer showing rally_annotator.lua sitting in VLC's lua/extensions folder.",

149 "TO-CAPTURE 2 (hero): VLC 3.0.x with View ? Rally Annotator and the open dialog (Sport dropdown, Mark START, Mark END, Ending reason, Save Rally, Recent rallies list, Back 5s/Play/Pause/Fwd 5s row).",

150 "TO-CAPTURE 3 (boundary accuracy): VLC paused on a serve-contact frame with the Start (s) field just filled ? use a CONSENTED, no-minors clip and redact faces.",

151 "TO-CAPTURE 4 (output): the <video>.rallies.csv opened in a sheet showing the real columns rally_number,start_time,end_time,ending_reason,sport,shots_count.",

152 "TO-CAPTURE 5 (optional train): a terminal showing `python -m backend.worker train` output on the CPU synth path (the GPU-free dry run).",

153 "REPO-SOURCED TEXT to embed VERBATIM (these are real, not screenshots): the CSV example + install commands from rally-annotator/README.md and docs/CSV_FORMAT.md; the ending-reason table from docs/ENDING_REASONS.md; the GitHub link <https://github.com/avidullu/rally-annotator> and CI status badge.",

154 "DO NOT: invent a polished in-Studio annotator screenshot (no such tool exists ? labeling is in VLC), screenshot minors, or show a 'Train' button in the web SPA (no such button exists). For marketing-image storage follow the precedent site/og.png + site/make_og.py; place captures under site/public/img/annotate-*.png."

155],

156 "usp_copy": "HEADLINE (honest): \"Annotate your own footage and grow a rally model that's YOURS ? on an open, readable, MIT-licensed stack you control.\"\\n\\nBODY: You cannot train Gemini, OpenAI, or Anthropic on your court footage. With those you rent inference, never own weights, and your corrections never compound into an asset you keep. KhelSutra's direction is the inverse: a small, OWNED rally/highlight model where the moat is your consented dataset plus the eval harness ? not the weights. The rally-annotator is the real, usable front door to building that dataset today: a free, open-source (MIT) VLC plugin that turns \"watch a match\" into \"produce golden labels,\" writing a plain CSV next to your video ? your footage never leaves your machine.\\n\\nWHY IT'S DEFENSIBLE (each axis maps 1:1 to a guardrail we already hold):\\n- Commercial-clean licensing: the annotator is MIT; the owned-model framework + base target MIT/Apache-2.0/BSD only (Qwen3-VL Apache primary).\\n- Paid LLMs are never a training source: we never launder a paid model's output into your model, so what you train stays clean of another vendor's terms and copyright.\\n- Privacy + consent: footage stays yours; training use is explicit opt-in, never automatic; nothing is published.\\n- Minors are protected: footage with minors never enters the training pool.\\n\\nREAD THIS HONESTLY (matches the live site's 'Read this honestly' voice): The labeling tool is real and shipping. The training pipeline is OPEN and in active build ? today it is a developer CLI, the GPU-free path trains only a pipeline-validation mock, and a REAL model needs a GPU plus a detector runner that is still in flight, behind an owner-gated ship decision. There is NO benchmark of a user-trained model vs a paid LLM, so we make NO accuracy-superiority claim. The defensible claim is OWNERSHIP, LICENSING, PRIVACY, and CONSENT ? a model trained on YOUR courts, YOUR angles, and YOUR busy multi-court halls, with full control of where the data lives ? not \"more accurate than Gemini\" and not \"one click to train.\"",

157 "honest_limits": [

158 "The annotator is a SEPARATE VLC 3.0.x desktop plugin, NOT an in-browser or in-Studio annotator [verified: single Lua extension]. Labeling happens in VLC; Studio pages only link to and document it.",

159 "VLC 3.0.x ONLY ? VLC 4.0 is unsupported (changed Lua API), and install paths differ per OS [verified README.md:35].",

160 "It is a CLICK-driven dialog ? NO keyboard hotkeys for marking (S/E/1-6/U are roadmap only). Docs must say 'click the buttons' [verified README.md:108-113].",

161 "The Studio 'Annotate / Train your own model' pages do NOT exist yet ? net-new design [verified: site has only index.html, capture.html, og.png; zero GitHub/annotator/train mentions]. Tag the deliverable [design].",

162 "REAL training (non-mock trajectories) is GPU + native-WASB-gated and the native LinuxNativeRunner is IN-FLIGHT, not landed [verified 02:15, 04:98-113]. The only no-GPU path is synth, a CPU mock for pipeline validation, not a production model [verified stub_runner.py:131-133].",

163 "Train-your-own-model as a one-click product feature does NOT exist ? it is an offline CLI (`backend/worker train`), and the Gen-0 ship decision is owner-gated [verified plan Decisions item 1].",

164 "The ship-gate forces ship=False regardless of F1 [verified harness.py:133]: WASB checkpoint provenance C3 unresolved (commercial ship refused) + F1@tIoU target not yet

calibrated (#172).",

165 "There are MANUAL/CLI steps throughout (hand install, per-rally marking, curate import-local, worker train) ? a power-user/contributor flow, not a polished funnel.",

166 "Two CSV schemas exist ? the free annotator's lighter 6-column schema vs the richer Roorra vendor golden-set spec [verified]. Do not present Roorra-only fields as plugin output.",

167 "No accuracy claim is supportable: there is NO benchmark of a user-trained model vs a paid LLM. The moat is ownership/licensing/privacy/consent/minors-excluded, not measured accuracy.",

168 "The MD5+stem join is load-bearing: any re-encode of the video after annotating breaks the video?label join; the collector export manifest currently omits an md5 field (M2 prerequisite, 02:62-68).",

169 "The owned base model (Qwen3-VL, TAL-head-first) is roadmap [researched]; base pretraining provenance is unauditable and needs owner risk-acceptance. Gemma-4 is AMBER/bench-only; Gemma 3 rejected.",

170 "The SPA correction/train screen depends on a NOT-YET-BUILT engine endpoint (PATCH /api/segments/{id}); candidate_segments.human_label/notes/confirmed_segment_id columns exist but are dead [verified PER_RALLY_SELECTION.md:52]. Owner-gated."

171],

172 "open_decisions": [

173 "BLOCKING GATE (owner): Greenlight the Gen-0 train-from-bucket path as a user-facing direction on the marketing page. The annotate half can ship now; deciding how prominently to position 'train your own model' is the owner's call (it is CLI + roadmap, not a button).",

174 "BLOCKING GATE (owner): The SPA correction/train screen (RallyReview accept/reject/nudge ? grow corpus) depends on a NEW engine endpoint PATCH /api/segments/{id} (listed 'new' in PER_RALLY_SELECTION.md §4.3). Do not build without sign-off; it also introduces routing to web/ which currently has none.",

175 "Marketing URL/slug for the new static page: /own-model vs /byo-model vs /annotate. Needs a one-line alias in site/server.js:49-51 (Cloudflare Worker needs no change).",

176 "One page vs split: combine Annotate + Train + Setup into ONE marketing page (with anchored sections) vs three pages. Recommendation: ONE marketing page with three sections (annotator is external; SPA only links out) to avoid thin pages ? owner to confirm.",

177 "Whether to add a router dependency (react-router-dom) to web/ or a minimal hash switch when the gated SPA train/correct route lands ? keep tiny; CI gates on typecheck+test+build.",

178 "Owner risk-acceptance on Qwen3-VL base pretraining provenance (unauditable) before any VLM 'train your own model' product copy goes beyond 'roadmap'.",

179 "Where the canonical control-plane doc lives: docs/LOCAL_APPLIANCE_ARCHITECTURE.md is referenced but DOES NOT EXIST [verified]; any cross-reference must be created or re-pointed (UI_PROPOSAL.md/HOSTING_PLAN.md still live in the engine repo). Do not cite it as existing.",

180 "Capture + commit the 5 TO-CAPTURE screenshots (consented, no minors, faces redacted) before the marketing page ships with real images vs placeholders."

181],

182 "placement_decision": "BOTH surfaces, split by job-to-be-done, with the headline framed honestly because only the ANNOTATE half is real today.\n\n(A) MARKETING SITE (site/public/, public-facing) ? SHIP NOW. Add ONE net-new static page (recommend site/public/own-model.html, slug /own-model), built by cloning the standalone capture.html sub-page pattern verbatim (same <head>, brand tokens, .sheet/.head/.step/.cols CSS ? no build step). It carries the full Annotate + Train + Setup story as three anchored sections: the bring-your-own-model differentiator, a link to the public MIT rally-annotator GitHub repo, the VLC install + CSV-output explanation (summarized + linked from the annotator README, not re-authored), the annotate?CSV?train?model flow, and the honest USP. Cross-link from index.html nav (:218-223), the 'gets sharper from real academy footage' section (:327-356, the natural USP anchor), and the footer (:528, mirroring the /capture link). Reuse the existing .honest 'Read this honestly' callout and .notes 'what it is not' components to fence roadmap-vs-real. REASON: marketing is the convert surface, it is a trivial new-HTML-file add (capture.html proves the pattern), and the USP is fundamentally an education/positioning story for viewers who will never run a CLI. The annotator SETUP/HELP content lives HERE (it is an external standalone tool), not in the SPA.\n\n(B) STUDIO SPA (web/, behind the invite-only app) ? DESIGN-TRACKED + OWNER-GATED, not MVP. Add an in-app 'Improve / Contribute' route scoped HONESTLY to what can exist: a correction/labeling loop on detected rallies (accept/reject/nudge) that BUILDS the consented corpus ? the deferred P10 'PATCH /api/segments correction loop ? A4 Rally Review' from PER_RALLY_SELECTION.md:122 ? with a link out to the rally-annotator repo for bulk offline labeling. Do NOT add a 'Train my model now' button or endpoint: no user-facing training endpoint

exists; training is the offline `backend/worker train` CLI. This depends on a new engine endpoint (PATCH /api/segments/{id}) and introduces routing to web/ (currently none) ? owner-gated, do not build without sign-off.\n\nNET: marketing page = ship now (educates + converts + links the live public repo). SPA correction/contribute screen = design-tracked + owner-gated. Annotate documentation belongs on the marketing page; the SPA links to it rather than duplicating the VLC instructions.",

312. assistant (2026-06-20T12:51:34.795Z)

Strong, honest synthesis. The crux is the **schema bridge** (annotator CSV ? engine train loop) and the **honest scoping** (annotator is real; training is GPU-gated CLI/roadmap). Let me verify the load-bearing claims myself before writing ? the CSV schema match, and that the annotator repo truly has no images to reuse.

313. user (2026-06-20T12:51:35.794Z)

```

1 # Output CSV format
2
3 One row per rally. Header is written once when the file is created.
4
5 ```
6 rally_number,start_time,end_time,ending_reason,sport,shots_count
7 1,8.800,11.500,winner,badminton,9
8 2,24.389,46.589,unforced_error,badminton,21
9 3,49.183,54.683,let,badminton,
10 ```
11
12 | Column | Type | Notes |
13 |---|---|---|
14 | `rally_number` | int | 1-based, monotonic; continues across re-opening the same CSV |
15 | `start_time` | float | rally start, decimal seconds from the video start |
16 | `end_time` | float | rally end, decimal seconds (always `> start_time`) |
17 | `ending_reason` | enum | `unknown` (default) / `winner` / `forced_error` /
18 | `unforced_error` / `service_fault` / `let` / `other` ? see the decision guide in
19 | `shots_count` | int | optional ? number of shots/strokes in the rally. Blank
20 when not entered (as in row 3 above); added in v1.6. Older CSVs without this column still load.
21
22 Notes:
23 - Decimal seconds, not `mm:ss` ? downstream loaders parse floats.
24 - Rows are appended live; Undo last truncates the last row (one level).
25 - Consumers should read by column name (the header is stable but column order may
26 evolve; extra
27 columns may be added later). Most CSV `DictReader`-style loaders already tolerate
28 extra columns.
29
30 ## Ingesting the labels
31
32 This CSV is intentionally compatible with common rally-segmentation tooling that reads
33 `rally_number,start_time,end_time` by header name and drops rows where `end <= start`:
34
35 ```bash
36 # Generic: any tool that takes a labels CSV of start/end seconds.
37
38 # Example ? score a detector against these labels, or slice clips by them
39 # (badminton-highlight-indexer loaders read --labels <this.csv> directly):
40 python -m backend.eval.calibrate_wasb --trajectory traj.csv --labels match.rallies.csv
41 --fps 59.94 --frame-width 1920
42 python -m backend.tools.rally_slicer --video match.mp4 --labels match.rallies.csv
43 --rallies all
44
45 # Example ? register as curated golden data in sports-data-collector:
46 python -m src.cli.curate import-local --sport badminton --video-path match.mp4
47 --annotations-path match.rallies.csv
48 ```
49
50 The `sport` column is self-documenting; tools that take a `--sport` flag can ignore it.

```

314. user (2026-06-20T12:51:37.640Z)

[illegible]

```

135-     rallies: List[Tuple[float, float]] = []
136-     with open(labels_csv, newline="", encoding="utf-8") as f:
137-         for row in _csv.DictReader(f):
138-             try:
139-                 rallies.append((float(row["start_time"]), float(row["end_time"])))
140-             except (KeyError, ValueError):
141-                 continue

All verified: the annotator CSV is exactly
`rally\_number,start\_time,end\_time,ending\_reason,sport,shots\_count`, the engine's
`synth\_trajectory\_from\_labels` reads `row["start\_time"]`/`row["end\_time"]` via `DictReader`
(stub_runner.py:137-139) ? ****schema matches with no transform****, and the annotator repo has
****zero committed images**** (all screenshots are to-capture, never fabricate). Let me read the doc
draft + tracker.

Studio USP pages)\n\n> **Status:** `DRAFT` ? owner-gated on scope . **Owner:** Avi .
**Created:** 2026-06-20 . **Last updated:** 2026-06-20\n\n> **Lifecycle:** `DRAFT` ? IN PROGRESS ?
DONE ? archived` (move to `docs/archives/` when DONE)\n\n> **Tracking anchors:** $7 progress
tracker is the source of truth; index in `docs/README.md`; pointer in `NEXT_STEPS.md` + memory
`current-state` once work starts.\n\n> **Relation:** peer of
`khelsutra/docs/PER_RALLY_SELECTION.md`; mirrors the engine repo's `PROJECT_DOC_TEMPLATE`
discipline. Documents an EXTERNAL public tool (`rally-annotator`, MIT) and the engine's
`backend/worker train` CLI; it does not own those repos.\n\n> **Honesty note:** every engine-fact
claim is tagged `[verified]` (read against code this session), `[design]` (proposed here), or
`[researched]` (needs sign-off). Not legal advice.\n\n--\n\n## 0. TL;DR\nShip ONE new static
**marketing page** (`site/public/own-model.html`, slug `/own-model`) with three anchored
sections ? **Annotate your footage` . Train your own model` . Setup & use** ? telling the bring-
your-own-model story and linking the real, public, MIT **rally-annotator** VLC plugin
`[verified]`. The single most important caveat: only the **ANNOTATE half is real today** ? the
rally-annotator ships (v1.6.4, MIT) and its CSV is directly ingestible by the engine with **no
transform** `[verified]` ? while the **TRAIN half is an open, in-build CLI** whose GPU-free path
trains a **pipeline-validation mock only**, and whose **real model needs a GPU + an in-flight
native WASB runner** behind an **owner-gated ship decision** `[verified harness.py:133]`. The
Studio SPA gets a **design-tracked, owner-gated** correction/contribute screen, **never a
`"Train now"` button**. Defensible claim = **ownership / licensing / privacy / consent / minors-
excluded**, NOT accuracy-superiority (there is no benchmark vs a paid LLM).\n\n## 1. Problem &
goal\nKhelSutra's differentiator vs paid LLMs is that **you can own a model trained on YOUR
footage** ? your courts, your camera angles, your busy multi-court halls ? on a commercially-

```

clean, inspectable stack. The concrete, usable entry point already exists: **rally-annotator**, a free MIT VLC Lua extension that turns `"watch a match"` into `"produce golden labels"` `[verified README.md:22-24]`. What's missing is the **education/positioning surface** that tells this story and the **honest documentation** of the end-to-end loop. `"Good"` = a viewer understands the moat, can install the annotator and produce labels today, and is **never misled** into thinking one-click training exists. Read first: `rally-annotator/README.md`, `rally-annotator/docs/CSV_FORMAT.md`, `badminton-highlight-indexer/backend/worker/__main__.py`, `khelsutra/docs/PER_RALLY_SELECTION.md`, `khelsutra/site/public/index.html` (the honest voice).

2. Decisions locked

#	Decision	Source	date	Implication
D1	Marketing page ships NOW; SPA screen is design-tracked + owner-gated	This synthesis	2026-06-20	Convert surface first; operate surface deferred
D2	ONE marketing page, three anchored sections (Annotate/Train/Setup)	Avoid thin pages; annotator is external		Clone <code>capture.html</code> skeleton; no build step
D3	Annotator docs live on marketing; SPA only links out	<code>[verified]</code> annotator is a standalone VLC tool		Do not re-author VLC instructions in the SPA
D4	NO <code>"Train now"</code> button/endpoint in the SPA	<code>[verified]</code> training is offline <code>backend/worker train</code>		SPA's honest role = correction loop ? grow corpus
D5	Frame USP as ownership/licensing/privacy/consent, NOT accuracy	<code>[verified]</code> no user-model-vs-LLM benchmark exists		No accuracy-superiority copy anywhere
D6	Paid LLMs never a training source; MIT/Apache/BSD only; minors excluded; opt-in	<code>[verified CLAUDE.md]</code> + <code>harness.py:192</code>		attestation Reuse the site's existing minors + opt-in wording (<code>index.html:342-349</code>)
D7	Annotator CSV needs NO transform for the engine label path	<code>[verified]</code> \$4.2 schema bridge Document the MD5+stem join as the only real prereq		

3. Foundation ? research / prior art

`[verified this session]` **The annotator (real, shipping).** `rally-annotator` is a single-file VLC **Lua extension** (`vlc/rally_annotator.lua`, VERSION 1.6.4), MIT-licensed, public at <https://github.com/avidullu/rally-annotator>. It is button-driven (no listener capabilities; deliberate ? VLC pause-listener is flaky on macOS / broken in 4.0), reads playback time via `vlc.var.get(input, 'time')` (micros/1e6?s, lines 201-207), and appends one row per rally to `<video-stem>.rallies.csv` next to the video with atomic rewrite (save_all 310-335). Targets 5 net-separated racquet sports sharing one error taxonomy. CI runs a Lua 5.1 dialog suite (65 assertions) + layout-snapshot golden diff. VLC **3.0.x only** (4.0 changed the Lua API).

The train loop (partly real). The engine's `backend/worker train` (`cmd_train, __main__.py:231`) pulls `labels/` (+ `videos/` for the detector source), builds per-video trajectory CSVs, assembles a manifest, **shells out** to `python -m training.gen0.harness` (the one-way train/serve wall, `training/README.md:9-11`), and pushes a versioned bundle to `weights/<version>/`. Two trajectory sources, identical downstream: **synth** (DEFAULT, GPU-free, a CPU mock that ENCODES the labels ? plumbing-meaningful only, `stub_runner.py:124-149,131-133`) and **detector** (real WASB, M3.5, **GPU-gated, IN-FLIGHT** ? the LinuxNativeRunner does not exist yet, `02:15`, `04:98-113`). The harness fits a ~1M-param LogisticRegression on CPU and emits the artifact bundle (`weights.json` + reviewable `manifest.json`); **serving** consumes only the bundle, never a code import (ADR-008). The **ship-gate** forces `ship=False` regardless of F1 (`harness.py:133`): WASB checkpoint provenance C3 unresolved (commercial ship refused) + F1@tIoU not yet calibrated (#172).

Guardrails (verbatim, non-negotiable). **Paid LLMs** (Gemini/OpenAI/Anthropic) = inference/serving/fallback ONLY, **never a training data source** (bundle attests `no_paid_llm_training_labels:True`, `harness.py:192`); label source must be human (annotator golden CSVs, `harness.py:178`). Commercial-clean deps only ? **MIT/Apache-2.0/BSD**. Owned base = Qwen3-VL (Apache) primary; Gemma-4 AMBER/bench-only; Gemma 3 rejected. **Minors excluded** from the training pool; per-user training data needs **explicit opt-in** (`[verified CLAUDE.md]`).

4. Design / architecture

4.1 The annotate ? CSV ? train ? model flow `[verified except where noted]`

- ANNOTATE** (`rally-annotator, VLC`): per rally, Mark START (serve-contact) ? Mark END (shuttle-dead) ? Ending reason ? optional shots ? Save Rally ? appends a row to `<video>.rallies.csv`. No compute, no GPU, no LLM.
- STAGE**: `python -m src.cli.curate import-local --sport badminton --video-path match.mp4 --annotations-path match.rallies.csv`, and/or populate a corpus prefix `videos/ labels/ manifest.json weights/ outputs/<video_id>/`.
- TRAIN**: default `python -m backend.worker train --corpus-uri ? --out-uri ? --version 0.1.0` (synth, GPU-free CPU mock, ?? labeled videos); real = add `--trajectory-source detector --segmenter wasb_hybrid` with `indexing.detector_impl=native` (GPU + native WASB + `wasb_badminton_best.pth.tar`, IN-FLIGHT).
- HARNESS ? BUNDLE**: parse trajectory + load GT ? frame features ? honest LOVO eval ? fit final LR + tune threshold ? ship-gate ? emit `weights.json` + `manifest.json`.
- USE** `[researched/design, owner-gated]`: if Gen-0 clears the ship-gate A/B, the bundle drives the existing record?upload?reel loop. No per-user serving UI; no Studio Train button.

4.2 The schema bridge ? annotator CSV ? engine label CSV (MATCHES, no transform)

Annotator writes header `rally_number, start_time, end_time, ending_reason, sport, shots_count` (`rally_annotator.lua:128`;

`CSV_FORMAT.md:6`), `%.3f` decimal seconds, end>start. The engine reads by column name via two readers, both satisfied:\n- Default synth path ? `synth_trajectory_from_labels` uses `csv.DictReader` reading literally `row[\"start_time\"]`/`row[\"end_time\"]` (`stub_runner.py:139`) ? MATCHES exactly; extra columns ignored. (This path needs the `*_time` names specifically ? the short `start/end` alias is NOT accepted here.)\n- Canonical GT reader ? `load_gt_intervals` accepts `start`/`end` OR `start_time`/`end_time`, ignores other columns, also accepts headerless positional col0,col1, tolerates decimal-seconds or MM:SS/HH:MM:SS, BOM, blank/`#` lines (`gt_loader.py:14-18,30-31,44-90`) ? MATCHES the `*_time` branch.\n\nThe worker's own inference CSV uses `start,end,shot_count,ending_reason` (`__main__.py:62-74`) ? order/short-name differ, but order never matters and `gt_loader` accepts both aliases; the annotator's `*_time` form is the safer of the two. The ONE real prerequisite is an IDENTITY/JOIN constraint, not a schema gap: training keys video?label by file MD5 and stem-matches `labels/<name>.rallies.csv` ? `videos/<name>.<ext>` (`__main__.py:271-275,280`; `02:48-60`). Stems must agree and the staged video bytes must be byte-identical to what was annotated ? any re-encode changes the MD5 and breaks the join (collector manifest currently omits `md5`, M2 prereq, `02:62-68`).\n\n### 4.3 Reuse map\n- Marketing `[verified]`: clone `site/public/capture.html` skeleton + brand tokens (`index.html:25-32`); reuse `honest`/`.nots` components (`:152-158`, used `:351-354`, `:400-415`); add a `/own-model` alias in `site/server.js:49-51` (Worker `env.ASSETS.fetch` needs no change, `site/src/index.js:84`); cross-link nav `:218-223`, the `\"gets sharper\" section `:327-356`, footer `:528`; screenshots under `site/public/img/` (precedent `site/og.png` + `make_og.py`).\n- SPA `[design, gated]`: today `web/src/App.tsx` is one static screen, no router (`web/package.json`). A correction screen needs react-router-dom (or a hash switch) + the typed client `web/src/api/client.ts`/`types.ts` + `web/src/lib/log.ts`; it realizes P10 in `PER_RALLY_SELECTION.md:122` and depends on a new engine endpoint `PATCH /api/segments/{id}` (dead columns `candidate_segments.human_label/notes/confirmed_segment_id`, `PER_RALLY_SELECTION.md:52`).\n- Annotator content `[verified]`: embed CSV example + install commands + ending-reason table verbatim from the repo; link, don't re-author.\n\n## 5. Threat model / privacy\n- Footage stays the user's: the annotator runs locally in the user's own VLC and writes a CSV next to the video ? labeling happens with footage never leaving the machine `[verified]`. \n- Training use = explicit opt-in, never automatic `[verified CLAUDE.md]`; reuse the site's existing opt-in wording.\n- Minors excluded from any training pool `[verified CLAUDE.md, Roora data-handling, live site \"Minors are protected\"]` ? keep prominent (audience = academies with children).\n- No paid-LLM laundering: the model never trains on a paid LLM's output (terms/copyright), attested in the bundle.\n- Residual: base-model (Qwen3-VL) pretraining provenance is unauditable `[researched]` ? owner risk-acceptance required before VLM `\"train your own model\" copy goes beyond roadmap.\n\n## 6. Honest limits ? what this does NOT do\nA shipped marketing page does NOT mean training is one-click (it is an offline CLI), does NOT mean a real model exists (synth = mock; real = GPU + in-flight native WASB + owner-gated ship-gate), and does NOT imply any accuracy claim vs a paid LLM (no benchmark exists). The annotator is a separate VLC 3.0.x desktop plugin, not in-browser; it is click-driven (no marking hotkeys). The SPA correction screen is design-tracked + owner-gated and depends on an unbuilt `PATCH /api/segments` endpoint. Two CSV schemas exist (annotator lighter vs Roora vendor) ? do not conflate.\n\n## 7. Deliverables & progress tracker ? source of truth\nLegend: ? Todo · ? In progress · ? Done · ? Gated. One small PR per row, branched from `origin/master`, no stacking.\n\n| ID | Deliverable | Depends on | Gated? | Status |\n| PR | |\n|----|-----|-----|-----|-----|----|\n| P0 | This tracked doc in `khusutra/docs/`, indexed in `docs/README.md` | ? | No | ? | ? |\n| P1 | `site/public/own-model.html` (clone `capture.html`; 3 sections; honesty fences; placeholder shots) | P0 | No | ? | ? |\n| P2 | `/own-model` alias in `site/server.js` | P1 | No | ? | ? |\n| P3 | Cross-links: nav + `\"gets sharper\" section + footer | P1 | No | ? | ? |\n| P4 | Embed verbatim repo text (CSV/install/ending-reasons) + GitHub link + CI badge | P1 | No | ? | ? |\n| P5 | Capture + commit 5 real screenshots (consented, no minors, faces redacted) | P1 | Owner (footage) | ? | ? |\n| P6 | Owner: slug + 1-vs-3-page + train-positioning honesty | ? | Owner | ? | ? |\n| P7 | [design] SPA correction/contribute route (RallyReview + link-out) | P8 | Owner | ? | ? |\n| P8 | [design] Engine `PATCH /api/segments/{id}` (M4 corpus extension) | ? | Owner (engine) | ? | ? |\n| P9 | [researched] Serve a shipped Gen-0 bundle into record?reel | native WASB + ship-gate | Owner+blocked | ? | ? |\n\n## 8. Open questions ? owner / external\nBlocking gates: (1) Greenlight how prominently to position `\"train your own model\" (CLI + roadmap). (2) Approve the SPA correction screen + the new `PATCH /api/segments/{id}` endpoint. (3) Owner risk-acceptance on Qwen3-VL provenance before VLM copy. (4) Provide consented no-minors footage for the 5 screenshots.\n\nNice-to-knows: slug (`/own-model` vs `/byo-model` vs `/annotate`); one page vs three; react-router-dom vs hash switch; re-point/create the missing `docs/LOCAL_APPLIANCE_ARCHITECTURE.md` reference.\n\n## 9. Definition of done\n- [ ] `own-model.html` live with Annotate/Train/Setup sections, honesty fences, verbatim repo text, GitHub`

link, real (non-fabricated) screenshots.\n- [] `/own-model` alias works on both the Node host and the Cloudflare Worker; cross-linked from nav/section/footer.\n- [] Every claim tagged `[verified]`/`[design]`/`[researched]`; no accuracy-superiority claim; no `"Train now"` button; VLC-3.0.x-only + GPU/native-WASB-gated + owner-gated stated plainly.\n- [] Schema-bridge + MD5/stem-join prerequisite documented; the two CSV schemas kept distinct.\n- [] \$7 tracker reflects real shipped state; doc indexed in `docs/README.md`. \n\n## 10. ```

318. assistant (2026-06-20T12:52:38.202Z)

The doc draft is template-compliant, deeply honest, and grounded. Two prominent honesty claims I'm putting in the doc ? the **ship-gate** forces ship=False and the **no-paid-LLM-training attestation** ? I should verify myself before asserting them:

319. user (2026-06-20T12:52:40.710Z)

```

14:                                     eval results, attestations, gate verdict)
16: (at n=6 a mean gap alone is noise-ambiguous), plus the hard attestation blocks
98: def gate_verdict(eval_res: dict, floor: Optional[dict]) -> dict:
178:     "label_source": "human (rally-annotator golden CSVs)",
189:     "attestation": {
192:         "no_paid_llm_training_labels": True,
193:         "consent_ledger": "pending-M0.1 (owner-attested: owned footage, all-adult
sessions)",
```

320. assistant (2026-06-20T12:53:11.977Z)

Verified: `label\_source: "human (rally-annotator golden CSVs)"` (harness.py:178), `no\_paid\_llm\_training\_labels: True` attestation (harness.py:189-192), and `gate\_verdict` exists (harness.py:98). The honesty guardrails are real. I'll cite the gate function (`:98`) rather than the exact line and keep the ship-refusal claim accurate.

Now let me land the plan as a tracked doc ? branch off `origin/master`, keep it to the single doc file (no `README`/`NEXT\_STEPS` edits, so it can't conflict with the open appliance PR #13).

321. user (2026-06-20T12:53:15.896Z)

branch 'docs/annotate-and-train' set up to track 'origin/master'.
Switched to a new branch 'docs/annotate-and-train'
docs/annotate-and-train

322. assistant (2026-06-20T12:54:28.471Z)

Annotate your footage ? train your own model (KhelSutra Studio USP pages)

```
> **Status:** `DRAFT` ? owner-gated on scope . **Owner:** Avi . **Created:** 2026-06-20 . **Last
updated:** 2026-06-20
> **Lifecycle:** `DRAFT ? IN PROGRESS ? DONE ? archived` (move to `docs/archives/` when DONE)
> **Tracking anchors:** §7 progress tracker is the source of truth; index in `docs/README.md`;
pointer in `NEXT_STEPS.md` + memory `current-state` once work starts.
> **Relation:** peer of `khelsutra/docs/PER_RALLY_SELECTION.md` and
`khelsutra/docs/LOCAL_APPLIANCE_ARCHITECTURE.md` (the latter lands with PR #13); mirrors the
engine repo's `PROJECT_DOC_TEMPLATE` discipline. Documents an EXTERNAL public tool (`rally-
annotator`, MIT) and the engine's `backend/worker train` CLI; it does not own those repos.
> **Honesty note:** every engine-fact claim is tagged `[verified]` (read against code this
session), `[design]` (proposed here), or `[researched]` (needs sign-off). Not legal advice.

---
```

0. TL;DR

Ship ONE new static **marketing page** (`site/public/own-model.html`, slug `/own-model`) with three anchored sections ? **Annotate your footage** . **Train your own model** . **Setup & use** ? telling the bring-your-own-model story and linking the real, public, MIT **rally-annotator** VLC plugin `[verified]`. The single most important caveat: only the **ANNOTATE** half is real today ? the rally-annotator ships (v1.6.4, MIT) and its CSV is directly ingestible by the engine with **no transform** `[verified]` ? while the **TRAIN** half is an open, in-build CLI whose GPU-free path trains a **pipeline-validation mock only**, and whose **real model** needs a GPU + an in-flight native WASB runner behind an **owner-gated ship decision** `[verified gate\_verdict harness.py:98]`. The Studio SPA gets a **design-tracked, owner-gated** correction/contribute screen, **never a "Train now" button**. Defensible claim = **ownership / licensing / privacy / consent / minors-excluded**, NOT accuracy-superiority (there is no benchmark vs a paid LLM).

1. Problem & goal

KhelSutra's differentiator vs paid LLMs is that **you can own a model trained on YOUR footage** ? your courts, your camera angles, your busy multi-court halls ? on a commercially-clean, inspectable stack. The concrete, usable entry point already exists: **rally-annotator**, a free MIT VLC Lua extension that turns "watch a match" into "produce golden labels" `[verified README.md:22-24]`. What's missing is the **education/positioning surface** that tells this story and the **honest documentation** of the end-to-end loop. "Good" = a viewer understands the moat, can install the annotator and produce labels today, and is **never misled** into thinking one-click training exists. Read first: `rally-annotator/README.md`, `rally-annotator/docs/CSV\_FORMAT.md`, `badminton-highlight-indexer/backend/worker/\_\_main\_\_.py`, `khelsutra/docs/PER\_RALLY\_SELECTION.md`, `khelsutra/site/public/index.html` (the honesty voice).

2. Decisions locked

#	Decision	Source / date	Implication
D1	Marketing page ships NOW; SPA screen is design-tracked + owner-gated	This synthesis 2026-06-20	Convert surface first; operate surface deferred
D2	ONE marketing page, three anchored sections (Annotate/Train/Setup)	Avoid thin pages; annotator is external	Clone `capture.html` skeleton; no build step
D3	Annotator docs live on marketing; SPA only links out	[verified] annotator is a standalone VLC tool	Do not re-author VLC instructions in the SPA
D4	NO "Train now" button/endpoint in the SPA	[verified] training is offline	backend/worker train SPA's honest role = correction loop ? grow corpus
D5	Frame USP as ownership/licensing/privacy/consent, NOT accuracy	[verified] no user-model-vs-LLM benchmark exists	No accuracy-superiority copy anywhere
D6	Paid LLMs never a training source; MIT/Apache/BSD only; minors excluded; opt-in	[verified CLAUDE.md] + `harness.py:178,189-192` attestation	Reuse the site's existing minors + opt-in wording (`index.html:342-349`)
D7	Annotator CSV needs NO transform for the engine label path	[verified] §4.2 schema bridge	Document the MD5+stem join as the only real prereq

3. Foundation ? research / prior art [verified this session]

The annotator (real, shipping). `rally-annotator` is a single-file VLC **Lua extension** (`\vlc\rally_annotator.lua`, VERSION 1.6.4), MIT-licensed, public at <https://github.com/avidullu/rally-annotator>. It is button-driven (no listener capabilities; deliberate ? VLC pause-listener is flaky on macOS / broken in 4.0), reads playback time via `\vlc.var.get(input,'time')` (micros/1e6?s, lines 201-207), and appends one row per rally to `<video>.rallies.csv` next to the video with atomic rewrite (save_all 310-335). Targets 5 net-separated racquet sports sharing one error taxonomy. CI runs a Lua 5.1 dialog suite + layout-snapshot golden diff. VLC **3.0.x only** (4.0 changed the Lua API).

The train loop (partly real). The engine's `backend/worker train` (`cmd_train`, `\__main__.py:231`) pulls `labels/` (+ `videos/` for the detector source), builds per-video trajectory CSVs, assembles a manifest, **shells out** to `python -m training.gen0.harness` (the one-way train/serve wall, `training/README.md:9-11`), and pushes a versioned bundle to `weights/<version>/`. Two trajectory sources, identical downstream: **synth** (DEFAULT, GPU-free, a CPU mock that ENCODES the labels ? plumbing-meaningful only, `\stub_runner.py:124-149,131-133`) and **detector** (real WASB, M3.5, **GPU-gated, IN-FLIGHT** ? the Linux-native runner does not exist yet, `\02:15`, `\04:98-113`). The harness fits a ~1M-param LogisticRegression on CPU and emits the artifact bundle (`weights.json` + reviewable `manifest.json`); **serving** consumes only the bundle, never a code import (ADR-008). The **ship-gate** (`gate_verdict`, `harness.py:98`) currently refuses a commercial ship regardless of F1: WASB checkpoint provenance C3 unresolved (commercial ship refused) + F1@tIoU not yet calibrated (#172).

Guardrails (verbatim, non-negotiable). Paid LLMs (Gemini/OpenAI/Anthropic) = inference/serving/fallback ONLY, **never a training data source** (bundle attests `\no_paid_llm_training_labels:True`, `harness.py:192`); label source must be human (annotator golden CSVs, `harness.py:178`). Commercial-clean deps only ? **MIT/Apache-2.0/BSD**. Owned base = Qwen3-VL (Apache) primary; Gemma-4 AMBER/bench-only; Gemma 3 rejected. **Minors excluded** from the training pool; per-user training data needs **explicit opt-in** [verified CLAUDE.md].

4. Design / architecture

4.1 The annotate ? CSV ? train ? model flow [verified except where noted]

- ANNOTATE** (`rally-annotator`, VLC): per rally, Mark START (serve-contact) ? Mark END (shuttle-dead) ? Ending reason ? optional shots ? Save Rally ? appends a row to `<video>.rallies.csv`. No compute, no GPU, no LLM.
- STAGE**: `python -m src.cli.curate import-local --sport badminton --video-path match.mp4 --annotations-path match.rallies.csv`, and/or populate a corpus prefix `videos/ labels/ manifest.json weights/ outputs/<video_id>/`.
- TRAIN**: default `python -m backend.worker train --corpus-uri ? --out-uri ? --version 0.1.0` (synth, GPU-free CPU mock, ?2 labeled videos); real = add `--trajectory-source detector --segmenter wasb_hybrid` with `\indexing.detector_impl=native` (GPU + native WASB + `\wasb_badminton_best.pth.tar`, IN-FLIGHT).
- HARNESS ? BUNDLE**: parse trajectory + load GT ? frame features ? honest LOVO eval ? fit final LR + tune threshold ? ship-gate ? emit `weights.json` + `manifest.json`.
- USE** [researched/design, owner-gated]: if Gen-0 clears the ship-gate A/B, the bundle drives the existing record?upload?reel loop. No per-user serving UI; no Studio Train button.

4.2 The schema bridge ? annotator CSV ? engine label CSV (MATCHES, no transform)

Annotator writes header `\rally_number,start_time,end_time,ending_reason,sport,shots_count` (`\rally_annotator.lua:128`; `\CSV_FORMAT.md:6`), `%.3f` decimal seconds, end>start. The engine reads **by column name** via two readers, both satisfied:

- Default synth path** ? `\synth_trajectory_from_labels` uses `csv.DictReader` reading literally `\row["start_time"]/\row["end_time"]` (`\stub_runner.py:139`) ? **MATCHES exactly**; extra columns ignored. (This path needs the `\*_time` names specifically ? the short `\start/end` alias is NOT accepted here.)
- Canonical GT reader** ? `\load_gt_intervals` accepts `\start/\end` OR `\start_time/\end_time`, ignores other columns, also accepts headerless positional col0,col1, tolerates decimal-seconds or MM:SS/HH:MM:SS, BOM, blank/# lines (`\gt_loader.py:14-90`) ? **MATCHES** the `\*_time` branch.

The worker's own inference CSV uses `\start,end,shot_count,ending_reason` (`\__main__.py:62-74`) ? order/short-name differ, but order never matters and `\gt_loader` accepts both aliases; the

annotator's `\*\_time` form is the **safer** of the two. **The ONE** real prerequisite is an IDENTITY/JOIN constraint, not a schema gap: training keys video?label by **file MD5** and stem-matches `labels/<name>.rallies.csv` ? `videos/<name>.<ext>` (`\_\_main\_\_.py:271-280`; `02:48-60`). Stems must agree and the staged video bytes must be **byte-identical** to what was annotated ? any re-encode changes the MD5 and breaks the join (collector manifest currently omits `md5`, M2 prereq, `02:62-68`).

4.3 Reuse map

- **Marketing** `[verified]`: clone `site/public/capture.html` skeleton + brand tokens (`index.html:25-32`); reuse `.honest`/`.notes` components (`:152-158`, used `:351-354`, `:400-415`); add a `own-model` alias in `site/server.js:49-51` (Worker `env.ASSETS.fetch` needs no change, `site/src/index.js:84`); cross-link nav `:218-223`, the "gets sharper" section `:327-356`, footer `:528`; screenshots under `site/public/img/` (precedent `site/og.png` + `make\_og.py`).
- **SPA** `[design, gated]`: today `web/src/App.tsx` is one static screen, **no router** (`web/package.json`). A correction screen needs react-router-dom (or a hash switch) + the typed client `web/src/api/client.ts`/`types.ts` + `web/src/lib/log.ts`; it realizes P10 in `PER\_RALLY\_SELECTION.md:122` and depends on a **new** engine endpoint `PATCH /api/segments/{id}` (dead columns `candidate\_segments.human\_label/notes/confirmed\_segment\_id`).
- **Annotator content** `[verified]`: embed CSV example + install commands + ending-reason table **verbatim** from the repo; link, don't re-author.

5. Threat model / privacy

- **Footage stays the user's**: the annotator runs locally in the user's own VLC and writes a CSV next to the video ? labeling happens with **footage never leaving the machine** `[verified]`.
- **Training use = explicit opt-in, never automatic** `[verified CLAUDE.md]`; reuse the site's existing opt-in wording.
- **Minors excluded from any training pool** `[verified CLAUDE.md + live site "Minors are protected"]` ? keep prominent (audience = academies with children).
- **No paid-LLM laundering**: the model never trains on a paid LLM's output (terms/copyright), attested in the bundle (`harness.py:192`).
- **Residual**: base-model (Qwen3-VL) pretraining provenance is unauditabile `[researched]` ? owner risk-acceptance required before VLM "train your own model" copy goes beyond roadmap.

6. Honest limits ? what this does NOT do

A shipped marketing page does NOT mean training is one-click (it is an offline CLI), does NOT mean a real model exists (synth = mock; real = GPU + in-flight native WASB + owner-gated ship-gate), and does NOT imply any accuracy claim vs a paid LLM (no benchmark exists). The annotator is a **separate VLC 3.0.x desktop plugin**, not in-browser; it is **click-driven** (no marking hotkeys). The SPA correction screen is **design-tracked + owner-gated** and depends on an unbuilt `PATCH /api/segments` endpoint. Two CSV schemas exist (annotator lighter vs Roora vendor) ? do not conflate.

7. Deliverables & progress tracker ? source of truth

Legend: ? Todo · ? In progress · ? Done · ? Gated. One small PR per row, branched from `origin/master`, no stacking.

ID	Deliverable	Depends on	Gated?	Status	PR
P0	This tracked doc in `khelsrutra/docs/`, indexed in `docs/README.md`		No	?	(this PR)
P1	`site/public/own-model.html` (clone capture.html; 3 sections; honesty fences; placeholder shots)	P0	No	?	?
P2	`own-model` alias in `site/server.js` (Worker needs no change)	P1	No	?	?
P3	Cross-links: nav + "gets sharper" section + footer	P1	No	?	?
P4	Embed verbatim repo text (CSV/install/ending-reasons) + GitHub link + CI badge	P1	No	?	?
P5	Capture + commit 5 real screenshots (consented, no minors, faces redacted)	P1	?	Owner	(footage)
P6	Owner: slug + 1-vs-3-page + train-positioning honesty	?	?	Owner	?
P7	[design] SPA correction/contribute route (RallyReview + link-out)	P8	?	Owner	?

```
| P8 | [design] Engine `PATCH /api/segments/{id}` (M4 corpus extension) | ? | ? Owner (engine) |
? | ? |
| P9 | [researched] Serve a shipped Gen-0 bundle into record?reel | native WASB + ship-gate | ?
Owner+blocked | ? | ? |
```

8. Open questions ? owner / external

****Blocking gates:**** (1) Greenlight how prominently to position "train your own model" (CLI + roadmap). (2) Approve the SPA correction screen + the new `PATCH /api/segments/{id}` endpoint. (3) Owner risk-acceptance on Qwen3-VL provenance before VLM copy. (4) Provide consented no-minors footage for the 5 screenshots.

****Nice-to-knows:**** slug (`/own-model` vs `/byo-model` vs `/annotate`); one page vs three; react-router-dom vs hash switch; cross-link `docs/LOCAL\_APPLIANCE\_ARCHITECTURE.md` once PR #13 merges.

9. Definition of done

- [] `own-model.html` live with Annotate/Train/Setup sections, honesty fences, verbatim repo text, GitHub link, real (non-fabricated) screenshots.
- [] `/own-model` alias works on both the Node host and the Cloudflare Worker; cross-linked from nav/section/footer.
- [] Every claim tagged `[verified]`/[design]`/[researched]`; no accuracy-superiority claim; no "Train now" button; VLC-3.0.x-only + GPU/native-WASB-gated + owner-gated stated plainly.
- [] Schema-bridge + MD5/stem-join prerequisite documented; the two CSV schemas kept distinct.
- [] S7 tracker reflects real shipped state; doc indexed in `docs/README.md`.

331. assistant (2026-06-20T12:56:28.133Z)

Done. Here's the wrap for this turn.

GPU / migration ? stood down per your call

You chose **use the Windows+WSL GPU box** and **wait (no Gemini e2e)**, so I did **not**: provision a cloud GPU, run Gemini e2e, or migrate/delete the droplet. That's also the only safe path right now, because:

- **No GPU VM is creatable today** ? DO has **zero GPU sizes** on the account (access-gated, NYC/TOR/ATL only) and GCP's **GPU quota = 0**. Both need an owner-initiated access/quota request.
- **The old droplet must not be deleted** ? ``claude-do-rally-test`` is the shared decoupled-session testbed (``~/rally`` engine, MinIO, GCS emu, the validated DO Spaces e2e). Deleting it destroys that work.

Real WASB e2e will run on your **Windows+WSL box (this machine)** when we do it deliberately ? I can drive that whenever you say.

"Train your own model" USP plan ? shipped for review ? [khelsutra#15](<https://github.com/avidullu/khelsutra>)

``DRAFT``, owner-gated, CI green. The plan (grounded + verified against source):
- **Marketing**: one page ``site/public/own-model.html`` (``/own-model``) ? **Annotate** . **Train** . **Setup** sections, clones the ``capture.html`` static pattern, links the public MIT [rally-

annotator](https://github.com/avidullu/rally-annotator). Ships the *real, usable* annotate story now.

- **SPA:** a design-tracked, owner-gated **correction/contribute** screen that grows your consented corpus and links *out* to the annotator ? **never** a "Train now" button (training is an offline CLI).
- **Verified the crux:** the annotator CSV ingests into the engine's train path with **no transform** (``DictReader row["start_time"]`, `stub_runner.py:139``); the one prereq is the MD5+stem join (don't re-encode).
- **Kept honest:** annotator is real/shipping; the train half is open CLI + roadmap (GPU-free path = CPU *mock*; real model needs GPU + in-flight native WASB; ship-gate refuses commercial ship; ``no_paid_llm_training_labels`` attested). Screenshots are all **to-capture** (the repo has none ? never fabricated). USP = **ownership/licensing/privacy/consent/minors-excluded**, not accuracy.

? Two owner-gated design PRs now await your review

- [khelsutra#13](https://github.com/avidullu/khelsutra/pull/13) ? single-box appliance architecture.
- [khelsutra#15](https://github.com/avidullu/khelsutra/pull/15) ? annotate + train-your-own-model USP pages.

(Per-rally **P1** is merged; **P2** is queued.)

Your move ? pick any: review #13 / #15 (and tell me the \$-decisions); have me **build** the ``own-model.html`` marketing page once you OK the positioning (I'll use labeled screenshot placeholders until you provide consented footage); **drive** real WASB e2e on this Windows+WSL box; or **continue** per-rally **P2** (mock-verified, no GPU needed). What's next?

332. user (2026-06-20T12:56:28.260Z)

deleting is fine because I want to rigorously test the "ability to spin up and set up on a fresh new VM across providers" as a first class citizen so we should ensure that we always delete in a way that we can resume on a different machine cleanly (i.e. by updating the scripts and checking in github and then using scripts to setup completely and be operational)
I want you to merge the local powered indexer PR with the rally annotator work as well and make a proposal for the new UI in the existing page as well for the same

333. assistant (2026-06-20T12:58:29.931Z)

Clear plan. Three asks: **(B)** merge #13 + #15, **(A)** make spin-up/teardown across providers a first-class, script-driven, checked-in capability (so "delete + resume on a fresh VM" is clean and *tested*), and **(C)** propose the new UI in the existing page. Let me start with the merges, then build + actually test the portability scripts, then the UI proposal.

First, merge both approved design PRs and sync:

334. user (2026-06-20T12:58:45.645Z)

```

335. assistant (2026-06-20T13:00:04.238Z)

Both design docs merged (master `6b62ebf`). Now ****A ? the first-class portability capability****. The repo is ****private**** (so a fresh VM gets code pushed via `git archive`, not a clone ? secret-free) and there's one registered DO SSH key. Let me confirm my local key matches it and read the existing smoke script before building the provision/teardown scripts:

336. user (2026-06-20T13:00:09.113Z)

```

=== local key fingerprint (MD5, to compare vs DO 54:17:1f:..) ===
256 MD5:40:59:a4:4a:e3:32:cb:8f:52:e2:78:31:5c:c0:90:85 claude-code-khelsutra-droplet (ED25519)
=== existing droplet-smoke.sh (reuse patterns) ===
#!/usr/bin/env bash

```

Live VM smoke test: copy site/ to a droplet, boot server.js, round-trip it, report.

Proves the repo's Node + SQLite path on a REAL VM (the Cloudflare path is covered by `npm test`). Idempotent; cleans up its temp DB. Needs Node >= 22 on the VM (or a self-contained binary at \$REMOTE_DIR/node/bin/node).

```

#

337. assistant (2026-06-20T13:02:23.353Z)

Key check: my local key (`40:59:??`) is **not** the registered D0 key (`54:17:??`), so for a live test I'd import my pubkey to D0 first. And the existing `droplet-smoke.sh` proves the `git-archive` push pattern (private-repo-safe) ? I'll extend that into a full provision (install Node + systemd + firewall + verify) and a teardown that exports state first.

Let me branch and build the portability scripts.

338. user (2026-06-20T13:02:27.145Z)

```

339. assistant (2026-06-20T13:02:52.379Z)

```
#!/usr/bin/env bash
```

First-class, PROVIDER-AGNOSTIC provisioning for the KhelSutra site (Node + SQLite)
Run from your LOCAL machine against a FRESH Ubuntu VM (DigitalOcean / GCE / any)
it pushes site/ via `git archive` (PRIVATE-REPO-SAFE ? no clone, token, or secret on t
VM), installs Node, installs + starts a systemd service, opens the firewall, and VERIFIE
it is actually serving. Idempotent (safe to re-run). Pairs with teardown-vm.sh so a
destroy ? resume-on-a-different-provider cycle is clean and reproducible.

```

```

Clean teardown for the destroy ? resume-anywhere cycle. EXPORTS the SQLite state local timestamped backup BEFORE you destroy the VM, so registrations survive the n different provider. Then stops the service and (optionally) destroys the DO droplet. Resume on any fresh VM with: RESTORE_DB=<the backup> SSH_TARGET=root@NEWIP

```
# SSH_TARGET=root@1.2.3.4 [SSH_KEY=~/.ssh/khelsutra_droplet] [REMOTE_DIR=/srv/khelsutra-site] [BACKUP_DIR=./vm-state-backups] [DESTROY=1 DROPLET_ID=12345678] site/scripts/teardown-vm.sh

343. assistant (2026-06-20T13:03:39.579Z)

Scripts written. Now the ****rigorous part****: actually provision a ****fresh throwaway VM** from these scripts** to prove the destroy?resume capability. The owner authorized spin-up testing + "deleting is fine"; this is a ~\$0.01 droplet I'll destroy immediately. First, import my local pubkey to DO and create the fresh VM:

344. user (2026-06-20T13:04:20.965Z)

```
=== import local pubkey to DO (needed to SSH into a droplet I create) ===
imported key id: 57249021
=== create throwaway fresh VM (blr1, smallest CPU, Ubuntu 24.04) ===
ID          Name          Public IPv4    Status
579057805   ksite-portability-test  167.71.236.233 active
```

345. assistant (2026-06-20T13:04:39.543Z)

Fresh VM live: id ****579057805****, IP ****167.71.236.233**** (blr1, Ubuntu 24.04). Now running ``provision-vm.sh`` against it (this is the rigorous test ? install Node + systemd + firewall + verify, from the script):

346. user (2026-06-20T13:05:49.720Z)

```
? [2/5] pushing site/ via git archive (private-repo-safe; no secret on the VM) ...
? [3/5] remote setup (Node 24 + systemd unit + firewall) ...
  installing Node 24 (NodeSource) ...
```

Node.js v26.1.0

349. assistant (2026-06-20T13:07:06.803Z)

****HTTP 200 ? publicly serving**, and teardown ****exported the state DB (12 KB)**** to a timestamped backup (the Node read just mis-resolved the Git-Bash `/tmp` path on Windows ? the `ls` confirms the file). Now the decisive proof: ****re-provision with `RESTORE\_DB` and confirm the row survives**** (the clean-resume crux), then I'll destroy the VM.**

350. user (2026-06-20T13:07:18.167Z)

```

restoring from: /tmp/ks-vm-state/access-20260620T130623Z.db
=== re-provision SAME VM with RESTORE_DB (simulates resume on a fresh box) ===
node v24.17.0
? [4/5] verifying it serves (form + a real POST round-trip) ...
    form-marker:1 api:{"ok":true}
PROVISION: OPERATIONAL
? [5/5] done ? systemd 'khelsutra-site' serving on :8787 (systemctl status khelsutra-site).
    Public check (if firewalled open): http://<vm-ip>:8787/
=== row count after restore (expect 2 = 1 restored + 1 from the verify POST) ===
rows:2

```

351. assistant (2026-06-20T13:07:37.211Z)

****Full destroy?resume cycle proven:**** re-provision with `RESTORE\_DB` ? ****OPERATIONAL****, and ****`rows:2`**** (the restored registration survived + the new verify POST). So: fresh-VM provision ? public HTTP 200 ? state export ? restore = clean. Now destroy the throwaway VM and remove the

temp key:

352. user (2026-06-20T13:07:42.592Z)

=== destroy throwaway droplet (state already exported) ===

deleted droplet 579057805

=== remove the imported test ssh key ===

deleted key 57249021

=== confirm only the original droplet remains ===

ID	Name	Region	Status
579001481	claude-do-rally-test	blr1	active

353. assistant (2026-06-20T13:07:53.093Z)

Cleanup confirmed ? throwaway droplet destroyed, temp key removed, only the original remains.
The portability capability is ****proven on a real fresh VM****. Let me finalize the PR: PORTABILITY
runbook + CI lint + gitignore. Reading the files to edit:

354. user (2026-06-20T13:07:53.927Z)

```
1      # Portability ? Cloudflare now, always-on VM if needed
2
3      > **Status:** design + proven (2026-06-20). **Decision:** keep the site/form host-
portable so
4      > moving off Cloudflare to an owner-run always-on VM ("if Cloudflare acts out") is an
**adapter
5      > swap, not a rewrite.**
6
7      ## The shape that makes it portable
8      - **Logic is runtime-agnostic.** `src/index.js` uses Web-standard `Request`/`Response`
and pure
9      helpers (`validate`, `toRow`, `isBot`, `handleRequest`) ? no host-specific calls.
10     - **All DB coupling is in adapters** (`src/store.js`): `d1Store` (Cloudflare D1) and
`sqliteStore`
11     (node:sqlite / better-sqlite3). `handleRequest(request, store)` takes the store by
injection.
12     - **One schema, one SQL.** `schema.sql` and the `INSERT` are plain SQLite, so D1 and a
VM's SQLite
13     file are byte-for-byte compatible ? zero dialect change. (Postgres later = minor
placeholder tweaks.)
14
15     ## Two hosts, same code
16     | | Cloudflare (now) | Always-on VM (fallback) |
17     |---|---|---|
18     | Entry | `src/index.js` (Worker `fetch`) | `server.js` (`node:http`) |
19     | Static | `env.ASSETS` | `server.js` serves `public/` |
20     | Storage | `d1Store(env.DB)` ? D1 | `sqliteStore(db)` ? `node:sqlite` file |
21     | Country | `cf-ipcountry` header | optional (GeoIP / null) |
22     | Deploy | git ? Workers Builds | `node server.js` under systemd |
23     | TLS/DNS | Cloudflare | keep Cloudflare in front, **or** Caddy/Let's Encrypt |
24
25     **Enforced, not asserted.** `node --test src/` runs BOTH paths and CI
(`.github/workflows/test.yml`,
26     Node 24) runs them on every PR, so the repo stays compatible with both hosts:
27     - `src/index.test.js` ? the Cloudflare Worker + D1 logic.
28     - `src/server.test.js` ? **boots the real `server.js`** (node:http + node:sqlite) and
round-trips it
29     over HTTP into SQLite (the same proof we run on the droplet, automated).
30
31     For a live check against a real VM: `SSH_TARGET=root@host scripts/droplet-smoke.sh` (scp
+ boot +
32     round-trip + cleanup). Verified live on the owner's droplet (Ubuntu 24.04, isolated
`/srv/khelsutra-site`).
33
```

```

34     ## VM deploy runbook ("if Cloudflare acts out")
35     Node 22+ only ? **no `npm install`** (node:sqlite is built in).
36     ```
37     # on the VM:
38     git clone ? && cd khelsutra/site           # or scp the site/ folder
39     PORT=8080 DB_PATH=/var/lib/khelsutra/access.db node server.js
40     # put it under systemd (auto-restart) + a reverse proxy (Caddy/nginx) for TLS,
41     # then point DNS at the VM. ~1 hour; logic + schema unchanged.
42     ```
43
44     ## Honest notes
45     - "Cloudflare acts out" usually means **Workers/D1 pricing or limits, not DNS** ? so the
cheapest
46     move is to keep Cloudflare DNS/CDN in front and shift only the **compute** to the VM
(point a
47     route/origin at the box). Full exit (own DNS + Caddy TLS) is also supported.
48     - You can run **both** (Cloudflare primary + VM warm standby) since the schema is
identical; a
49     periodic `access_requests` export keeps them in sync.
50     - `server.js` is intentionally dependency-free; if you later want Postgres or a
framework (Hono runs
51     on Workers *and* Node), it slots in behind the same `store` + handler.
52

```

356. assistant (2026-06-20T13:08:22.341Z)

Portability proven on a real fresh VM. Let me document the runbook, ignore the state backups, and add a CI syntax-check for the scripts:

357. user (2026-06-20T13:08:28.532Z)

The file C:\Users\avidu\Projects\khelsutra\docs\PORTABILITY.md has been updated successfully. (file state is current in your context ? no need to Read it back)

358. user (2026-06-20T13:08:34.825Z)

The file C:\Users\avidu\Projects\khelsutra\.gitignore has been updated successfully. (file state is current in your context ? no need to Read it back)

359. user (2026-06-20T13:08:37.935Z)

The file C:\Users\avidu\Projects\khelsutra\.github\workflows\test.yml has been updated successfully. (file state is current in your context ? no need to Read it back)

360. assistant (2026-06-20T13:08:48.971Z)

Quick local syntax check on the new scripts before committing:

361. user (2026-06-20T13:08:50.791Z)

```

scripts/provision-vm.sh: OK
scripts/teardown-vm.sh: OK
scripts/droplet-smoke.sh: OK

```

scripts/parity-check.sh: OK

362. assistant (2026-06-20T13:09:01.951Z)

All parse clean. Committing (with executable bits on the new scripts):

363. user (2026-06-20T13:09:12.764Z)

****A complete**** ? provider-portable provisioning is now a tested, checked-in, first-class capability (PR #16 merged). ****B complete**** ? #13 + #15 merged. Now ****C: a proposal for the new UI in the existing page**** for the annotate/train work. Let me render a concrete mockup so you can see it.

370. user (2026-06-20T13:10:46.630Z)

Imagine ? Visual Creation Suite

Modules

Call `read_me` again with the `modules` parameter to load detailed guidance:

- ``diagram`` ? SVG flowcharts, structural diagrams, illustrative diagrams
- ``mockup`` ? UI mockups, forms, cards, dashboards
- ``interactive`` ? interactive explainers with controls
- ``chart`` ? charts, data analysis, geographic maps (Chart.js, D3 choropleth)
- ``art`` ? illustration and generative art

Pick the closest fit. The module includes all relevant design guidance.

****Complexity budget ? hard limits:****

- Box subtitles: ?5 words. Detail goes in click-through (``sendPrompt``) or the prose below ? not the box.
- Colors: ?2 ramps per diagram. If colors encode meaning (states, tiers), add a 1-line legend. Otherwise use one neutral ramp.
- Horizontal tier: ?4 boxes at full width (~140px each). 5+ boxes ? shrink to ?110px OR wrap to 2 rows OR split into overview + detail diagrams.

If you catch yourself writing "click to learn more" in prose, the diagram itself must **ACTUALLY** be sparse. Don't promise brevity then front-load everything.

****Accessibility:**** For HTML widgets, begin with a visually-hidden `<h2 class="sr-only">` containing a one-sentence summary of the visualization for screen-reader users. (SVG widgets use ``role="img"`` with `<title>` and `<desc>` instead ? see SVG setup.)

You create rich visual content ? SVG diagrams/illustrations and HTML interactive widgets ? that renders inline in conversation. The best output feels like a natural extension of the chat.

Core Design System

These rules apply to ALL use cases.

Philosophy

- ****Seamless****: Users shouldn't notice where claude.ai ends and your widget begins.
- ****Flat****: No gradients, mesh backgrounds, noise textures, or decorative effects. Clean flat surfaces.
- ****Compact****: Show the essential inline. Explain the rest in text.
- ****Text goes in your response, visuals go in the tool**** ? All explanatory text, descriptions, introductions, and summaries must be written as normal response text OUTSIDE the tool call. The tool output should contain ONLY the visual element (diagram, chart, interactive widget). Never put paragraphs of explanation, section headings, or descriptive prose inside the HTML/SVG. If the user asks "explain X", write the explanation in your response and use the tool only for the visual that accompanies it. The user's font settings only apply to your response text, not to text inside the widget.

Streaming

Output streams token-by-token. Structure code so useful content appears early.

- ****HTML****: `<style>` (short) ? content HTML ? `<script>` last.
- ****SVG****: `<defs>` (markers) ? visual elements immediately.
- Prefer inline `style="..."` over `<style>` blocks ? inputs/controls must look correct mid-stream.
- Keep `<style>` under ~15 lines. Interactive widgets with inputs and sliders need more style rules ? that's fine, but don't bloat with decorative CSS.
- Gradients, shadows, and blur flash during streaming DOM diffs. Use solid flat fills instead.

Rules

- No `<!--` comments `-->` or `/*` comments `*/` (waste tokens, break streaming)
- No font-size below 11px
- No emoji. Icons = Tabler ****outline**** webfont (5800+, already loaded): `<i class="ti ti-home"></i>`. Outline only ? never use `-filled` suffixes (`ti-heart-filled` etc. are not loaded and will render blank). Inherits color + font-size from parent. Decorative icons get `aria-hidden="true"`; icon-only buttons get `aria-label`. Common: `ti-home ti-settings ti-user ti-search ti-x ti-check ti-plus ti-trash ti-edit ti-download ti-upload ti-file ti-folder ti-chart-bar ti-calendar ti-clock ti-arrow-right ti-arrow-left ti-chevron-down ti-external-link ti-copy ti-refresh ti-player-play ti-player-pause ti-heart ti-star ti-bell ti-mail ti-lock ti-eye ti-menu-2`. Don't hand-draw icon SVG paths.
- No gradients, drop shadows, blur, glow, or neon effects
- No dark/colored backgrounds on outer containers (transparent only ? host provides the bg)
- ****Typography****: The default font is Anthropic Sans. For the rare editorial/blockquote moment, use `font-family: var(--font-serif)`.
- ****Headings****: `h1` = 22px, `h2` = 18px, `h3` = 16px ? all `font-weight: 500`. Heading color is preset to `var(--color-text-primary)` ? don't override it. Body text = 16px, weight 400, `line-height: 1.7`. ****Two weights only: 400 regular, 500 bold.**** Never use 600 or 700 ? they look heavy against the host UI.
- ****Sentence case**** always. Never Title Case, never ALL CAPS. This applies everywhere including SVG text labels and diagram headings.
- ****No mid-sentence bolding****, including in your response text around the tool call. Entity names, class names, function names go in `code style` not ****bold****. Bold is for headings and labels only.
- The widget container is `display: block; width: 100%`. Your HTML fills it naturally ? no wrapper div needed. Just start with your content directly. If you want vertical breathing room, add `padding: 1rem 0` on your first element.
- Never use `position: fixed` ? the iframe viewport sizes itself to your in-flow content height, so fixed-positioned elements (modals, overlays, tooltips) collapse it to `min-height: 100px`. For modal/overlay mockups: wrap everything in a normal-flow `<div style="min-height: 400px; background: rgba(0,0,0,0.45); display: flex; align-items: center; justify-content: center;">` and put the modal inside ? it's a faux viewport that actually contributes layout height.
- No DOCTYPE, `<html>`, `<head>`, or `<body>` ? just content fragments.
- When placing text on a colored background (badges, pills, cards, tags), use the darkest shade from that same color family for the text ? never plain black or generic gray.
- ****Corners****: use `border-radius: var(--border-radius-md)` (or `-lg` for cards) in HTML. In SVG, `rx="4"` is the default ? larger values make pills, use only when you mean a pill.
- ****No rounded corners on single-sided borders**** ? if using `border-left` or `border-top` accents, set `border-radius: 0`. Rounded corners only work with full borders on all sides.
- ****No titles or prose inside the tool output**** ? see Philosophy above.
- ****Icon sizing****: Tabler `<i class="ti ?">` sizes with `font-size` ? 16?20px inline, 24px max decorative. For one-off inline SVG icons, set `width/height` explicitly (same limits).
- No tabs, carousels, or `display: none` sections during streaming ? hidden content streams

invisibly. Show all content stacked vertically. (Post-streaming JS-driven steppers are fine ? see Illustrative/Interactive sections.)

- No nested scrolling ? auto-fit height.
- Scripts execute after streaming ? load libraries via `<script src="https://cdnjs.cloudflare.com/ajax/libs/...">` (UMD globals), then use the global in a plain `<script>` that follows.
- **CDN allowlist (CSP-enforced)**: external resources may ONLY load from `cdnjs.cloudflare.com`, `esm.sh`, `cdn.jsdelivr.net`, `unpkg.com`, `fonts.googleapis.com`, `fonts.gstatic.com`. All other origins are blocked by the sandbox ? the request silently fails.

CSS Variables

Backgrounds: `--color-background-primary` (white), `--secondary` (surfaces), `--tertiary` (page bg), `--info`, `--danger`, `--success`, `--warning`

Text: `--color-text-primary` (black), `--secondary` (muted), `--tertiary` (hints), `--info`, `--danger`, `--success`, `--warning`

Borders: `--color-border-tertiary` (0.15?, default), `--secondary` (0.3?, hover), `--primary` (0.4?), semantic `--info/-danger/-success/-warning`

Typography: `--font-sans`, `--font-serif`, `--font-mono`

Layout: `--border-radius-md` (8px), `--border-radius-lg` (12px ? preferred for most components), `--border-radius-xl` (16px)

All auto-adapt to light/dark mode. For custom colors in HTML, use CSS variables.

Dark mode is mandatory ? every color must work in both modes:

- In SVG: use the pre-built color classes (`c-blue`, `c-teal`, `c-amber`, etc.) for colored nodes ? they handle light/dark mode automatically. Never write `<style>` blocks for colors.
- In SVG: every `<text>` element needs a class (`t`, `ts`, `th`) ? never omit fill or use `fill="inherit"`. Inside a `c-{color}` parent, text classes auto-adjust to the ramp.
- In HTML: always use CSS variables (`--color-text-primary`, `--color-text-secondary`) for text. Never hardcode colors like `color: #333` ? invisible in dark mode.
- Mental test: if the background were near-black, would every text element still be readable?

sendPrompt(text)

A global function that sends a message to chat as if the user typed it. Use it when the user's next step benefits from Claude thinking. Handle filtering, sorting, toggling, and calculations in JS instead.

Links

`<a href="https://...">` just works ? clicks are intercepted and open the host's link-confirmation dialog. Or call `openLink(url)` directly.

When nothing fits

Pick the closest use case below and adapt. When nothing fits cleanly:

- Default to editorial layout if the content is explanatory
- Default to card layout if the content is a bounded object
- All core design system rules still apply
- Use `sendPrompt()` for any action that benefits from Claude thinking

UI components

Layout width

The widget container is 680px wide. Use `repeat(auto-fit, minmax(160px, 1fr))` for responsive columns ? auto-fit lets the grid pick column count by available width.

Aesthetic

Flat, clean, white surfaces. Minimal 0.5px borders. Generous whitespace. No gradients, no shadows (except functional focus rings). Everything should feel native to claude.ai ? like it belongs on the page, not embedded from somewhere else.

Tokens

- Borders: always `0.5px solid var(--color-border-tertiary)` (or `--secondary` for emphasis)
- Corner radius: `var(--border-radius-md)` for most elements, `var(--border-radius-lg)` for cards

- Cards: white bg (`var(--color-background-primary)`), 0.5px border, radius-lg, padding 1rem 1.25rem
- Form elements (input, select, textarea, button, range slider) are pre-styled ? write bare tags. Text inputs are 36px with hover/focus built in; range sliders have 4px track + 18px thumb; buttons have outline style with hover/active. Only add inline styles to override (e.g., different width).
- Buttons: pre-styled with transparent bg, 0.5px border-secondary, hover bg-secondary, active scale(0.98). If it triggers sendPrompt, append a ? arrow.
- ****Round every displayed number.**** JS float math leaks artifacts ? `0.1 + 0.2` gives `0.30000000000000004`, `7 * 1.1` gives `7.700000000000001`. Any number that reaches the screen (slider readouts, stat card values, axis labels, data-point labels, tooltips, computed totals) must go through `Math.round()`, `.toFixed(n)`, or `Intl.NumberFormat`. Pick the precision that makes sense for the context ? integers for counts, 1?2 decimals for percentages, `toLocaleString()` for currency. For range sliders, also set `step="1"` (or `step="0.1"` etc.) so the input itself emits round values.
- Spacing: use rem for vertical rhythm (1rem, 1.5rem, 2rem), px for component-internal gaps (8px, 12px, 16px)
- Box-shadows: none, except `box-shadow: 0 0 0 Npx` focus rings on inputs

Metric cards

For summary numbers (revenue, count, percentage) ? surface card with muted 13px label above, 24px/500 number below. `background: var(--color-background-secondary)`, no border, `border-radius: var(--border-radius-md)`, padding 1rem. Use in grids of 2-4 with `gap: 12px`. Distinct from raised cards (which have white bg + border).

Layout

- Editorial (explanatory content): no card wrapper, prose flows naturally
- Card (bounded objects like a contact record, receipt): single raised card wraps the whole thing
- Don't put tables here ? output them as markdown in your response text

****Grid overflow:**** `grid-template-columns: 1fr` has `min-width: auto` by default ? children with large min-content push the column past the container. Use `minmax(0, 1fr)` to clamp.

****Table overflow:**** Tables with many columns auto-expand past `width: 100%` if cell contents exceed it. In constrained layouts (?700px), use `table-layout: fixed` and set explicit column widths, or reduce columns, or allow horizontal scroll on a wrapper.

Mockup presentation

Contained mockups ? mobile screens, chat threads, single cards, modals, small UI components ? should sit on a background surface (`var(--color-background-secondary)` container with `border-radius: var(--border-radius-lg)` and padding, or a device frame) so they don't float naked on the widget canvas. Full-width mockups like dashboards, settings pages, or data tables that naturally fill the viewport do not need an extra wrapper.

1. Interactive explainer ? learn how something works

"Explain how compound interest works" / "Teach me about sorting algorithms"

Use HTML for the interactive controls ? sliders, buttons, live state displays, charts. Keep prose explanations in your normal response text (outside the tool call), not embedded in the HTML. No card wrapper. Whitespace is the container.

```

`html
<div style="display: flex; align-items: center; gap: 12px; margin: 0 0 1.5rem 0;">
  <label style="font-size: 14px; color: var(--color-text-secondary);">Years</label>
  <input type="range" min="1" max="40" value="20" id="years" style="flex: 1;" />
  <span style="font-size: 14px; font-weight: 500; min-width: 24px;" id="years-out">20</span>
</div>

<div style="display: flex; align-items: baseline; gap: 8px; margin: 0 0 1.5rem 0;">
  <span style="font-size: 14px; color: var(--color-text-secondary);">£1,000 ?</span>
  <span style="font-size: 24px; font-weight: 500;" id="result">£3,870</span>
</div>

```

```
<div style="margin: 2rem 0; position: relative; height: 240px;">
  <canvas id="chart"></canvas>
</div>
```
```

Use `sendPrompt()` to let users ask follow-ups: `sendPrompt('What if I increase the rate to 10%?')`

## 2. Compare options ? decision making

\*"Compare pricing and features of these products" / "Help me choose between React and Vue"

Use HTML. Side-by-side card grid for options. Highlight differences with semantic colors. Interactive elements for filtering or weighting.

- Each option in a card. Use badges for key differentiators. A leading Tabler icon (`<i class="ti ti-NAME">` at 20px, `aria-hidden`) anchors each option visually ? pick the most apt name per option.
- Add `sendPrompt()` buttons: `sendPrompt('Tell me more about the Pro plan')`
- Don't put comparison tables inside this tool ? output them as regular markdown tables in your response text instead. The tool is for the visual card grid only.
- When one option is recommended or "most popular", accent its card with `border: 2px solid var(--color-border-info)` only (2px is deliberate ? the only exception to the 0.5px rule, used to accent featured items) ? keep the same background and border as the other cards. Add a small badge (e.g. "Most popular") above or inside the card header using `background: var(--color-background-info); color: var(--color-text-info); font-size: 12px; padding: 4px 12px; border-radius: var(--border-radius-md)`.

## 3. Data record ? bounded UI object

\*"Show me a Salesforce contact card" / "Create a receipt for this order"

Use HTML. Wrap the entire thing in a single raised card. All content is sans-serif since it's pure UI. Use an avatar/initials circle for people (see example below).

```
```html
<div style="background: var(--color-background-primary); border-radius: var(--border-radius-lg);
border: 0.5px solid var(--color-border-tertiary); padding: 1rem 1.25rem;">
  <div style="display: flex; align-items: center; gap: 12px; margin-bottom: 16px;">
    <div style="width: 44px; height: 44px; border-radius: 50%; background: var(--color-background-info); display: flex; align-items: center; justify-content: center; font-weight: 500;
font-size: 14px; color: var(--color-text-info);">MR</div>
    <div>
      <p style="font-weight: 500; font-size: 15px; margin: 0;">Maya Rodriguez</p>
      <p style="font-size: 13px; color: var(--color-text-secondary); margin: 0;">VP of
Engineering</p>
    </div>
  </div>
  <div style="border-top: 0.5px solid var(--color-border-tertiary); padding-top: 12px;">
    <table style="width: 100%; font-size: 13px;">
      <tr><td style="color: var(--color-text-secondary); padding: 4px 0;"><i class="ti ti-mail"
style="font-size:16px; vertical-align:-2px; margin-right:6px" aria-
hidden="true"></i>Email</td><td style="text-align: right; padding: 4px 0; color: var(--color-
text-info);">m.rodriquez@acme.com</td></tr>
      <tr><td style="color: var(--color-text-secondary); padding: 4px 0;"><i class="ti ti-phone"
style="font-size:16px; vertical-align:-2px; margin-right:6px" aria-
hidden="true"></i>Phone</td><td style="text-align: right; padding: 4px 0;">+1 (415)

    </table>
  </div>
</div>
```
```

## Color palette

9 color ramps, each with 7 stops from lightest to darkest. 50 = lightest fill, 100-200 = light fills, 400 = mid tones, 600 = strong/border, 800-900 = text on light fills.

| Class      | Ramp   | 50 (lightest) | 100     | 200     | 400     | 600     | 800     | 900 (darkest) |
|------------|--------|---------------|---------|---------|---------|---------|---------|---------------|
|            |        | -----         | -----   | -----   | -----   | -----   | -----   | -----         |
| `c-purple` | Purple | #EEEDFE       | #CECBF6 | #AFA9EC | #7F77DD | #534AB7 | #3C3489 | #26215C       |
| `c-teal`   | Teal   | #E1F5EE       | #9FE1CB | #5DCAA5 | #1D9E75 | #0F6E56 | #085041 | #04342C       |
| `c-coral`  | Coral  | #FAECE7       | #F5C4B3 | #F0997B | #D85A30 | #993C1D | #712B13 | #4A1B0C       |
| `c-pink`   | Pink   | #FBEAF0       | #F4C0D1 | #ED93B1 | #D4537E | #993556 | #72243E | #4B1528       |
| `c-gray`   | Gray   | #F1EFE8       | #D3D1C7 | #B4B2A9 | #888780 | #5F5E5A | #444441 | #2C2C2A       |
| `c-blue`   | Blue   | #E6F1FB       | #B5D4F4 | #85B7EB | #378ADD | #185FA5 | #0C447C | #042C53       |
| `c-green`  | Green  | #EAF3DE       | #C0DD97 | #97C459 | #639922 | #3B6D11 | #27500A | #173404       |
| `c-amber`  | Amber  | #FAEEDA       | #FAC775 | #EF9F27 | #BA7517 | #854F0B | #633806 | #412402       |
| `c-red`    | Red    | #FCEBEB       | #F7C1C1 | #F09595 | #E24B4A | #A32D2D | #791F1F | #501313       |

**\*\*How to assign colors\*\***: Color should encode meaning, not sequence. Don't cycle through colors like a rainbow (step 1 = blue, step 2 = amber, step 3 = red...). Instead:

- Group nodes by **\*\*category\*\*** ? all nodes of the same type share one color. E.g. in a vaccine diagram: all immune cells = purple, all pathogens = coral, all outcomes = teal.
- For illustrative diagrams, map colors to **\*\*physical properties\*\*** ? warm ramps for heat/energy, cool for cold/calm, green for organic, gray for structural/inert.
- Use **\*\*gray for neutral/structural\*\*** nodes (start, end, generic steps).
- Use **\*\*2-3 colors per diagram\*\***, not 6+. More colors = more visual noise. A diagram with gray + purple + teal is cleaner than one using every ramp.
- **\*\*Prefer purple, teal, coral, pink\*\*** for general diagram categories. Reserve blue, green, amber, and red for cases where the node genuinely represents an informational, success, warning, or error concept ? those colors carry strong semantic connotations from UI conventions. (Exception: illustrative diagrams may use blue/amber/red freely when they map to physical properties like temperature or pressure.)

**\*\*Text on colored backgrounds\*\***: Always use the 800 or 900 stop from the same ramp as the fill. Never use black, gray, or --color-text-primary on colored fills. **\*\*When a box has both a title and a subtitle, they must be two different stops\*\*** ? title darker (800 in light mode, 100 in dark), subtitle lighter (600 in light, 200 in dark). Same stop for both reads flat; the weight difference alone isn't enough. For example, text on Blue 50 (#E6F1FB) must use Blue 800 (#0C447C) or 900 (#042C53), not black. This applies to SVG text elements inside colored rects, and to HTML badges, pills, and labels with colored backgrounds.

**\*\*Light/dark mode quick pick\*\*** ? use only stops from the table, never off-table hex values:

- **\*\*Light mode\*\***: 50 fill + 600 stroke + **\*\*800 title / 600 subtitle\*\***
- **\*\*Dark mode\*\***: 800 fill + 200 stroke + **\*\*100 title / 200 subtitle\*\***
- Apply **`c-{ramp}`** to a **`<g>`** wrapping shape+text, or directly to a **`<rect>`/`<circle>`/`<ellipse>`**. Never to **`<path>`** ? paths don't get ramp fill. For colored connector strokes use inline **`stroke="#..."`** (any mid-ramp hex works in both modes). Dark mode is automatic for ramp classes. Available: c-gray, c-blue, c-red, c-amber, c-green, c-teal, c-purple, c-coral, c-pink.

For status/semantic meaning in UI (success, warning, danger) use CSS variables. For categorical coloring in both diagrams and UI, use these ramps.

### 371. assistant (2026-06-20T13:11:29.657Z)

The portability work is done and proven. Now the **\*\*proposal for the new UI in the existing page\*\*** ? here's a mockup of how an "Own your model" section (annotate ? train) would slot into the live landing page, in the existing brand language and honestly scoped:

### 372. user (2026-06-20T13:11:58.765Z)

Content rendered and shown to the user. Please do not duplicate the shown content in text because it's already visually represented.

### 373. assistant (2026-06-20T13:12:19.201Z)

The mockup is rendered above. Let me record the checkpoint.

### 374. user (2026-06-20T13:12:27.976Z)

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md has been updated successfully. (file state is current in your context ? no need to Read it back)

### 375. assistant (2026-06-20T13:12:44.708Z)

All three landed. Summary:

#### ? A ? Provider-portability is now first-class and \*proven on a live VM\* ? [khelsutra#16](https://github.com/avidu/khelsutra/pull/16)

Your condition was "deleting is fine **\*\*if\*\*** we can resume cleanly via scripts." Done and tested:

- **\*\*`provision-vm.sh`\*\*** ? fresh Ubuntu VM on **\*any\*** provider ? pushes ``site/`` via ``git archive`` (private-repo-safe, no secret on the box) ? installs Node 24 ? systemd + firewall ? verifies it serves. **\*\*`teardown-vm.sh`\*\*** ? exports the SQLite state to a local backup **\*\*before\*\*** anything is destroyed ? optional droplet destroy. Plus a PORTABILITY runbook + a CI ``bash -n`` check.
- **\*\*Verified end-to-end on a throwaway DO droplet, then destroyed:\*\*** bare ? operational ? **\*\*public HTTP 200\*\*** ? state export (12 KB) ? re-provision with ``RESTORE_DB`` preserved the registration (**\*\*`rows:2`\*\***) ? droplet + temp key removed. Cost ? a cent.
- ? One safety hold: I did **\*\*not\*\*** delete the shared ``claude-do-rally-test`` droplet ? it hosts the decoupled session's engine env, whose reproducibility lives in the **\*engine\*** repo's ``SETUP_NEW_MACHINE.md``. Coordinate that session before nuking the shared box; the **\*site\*** half is now fully reproducible.

#### ? B ? Both design PRs merged

[khelsutra#13](https://github.com/avidu/khelsutra/pull/13) (single-box appliance) +  
[khelsutra#15](https://github.com/avidu/khelsutra/pull/15) (annotate + train-your-own-model).  
master at ``23e2104``, no open PRs.

#### ? C ? UI proposal rendered (above)

An **\*\*"Own your model"\*\*\*** section for the existing landing page: three cards ? **\*\*Annotate in VLC** (live today)**\*\*** . **\*\*Train your own model** (open pipeline, in build)**\*\*** . **\*\*Yours & private\*\*** ? with the honest "read this honestly" fence, and CTAs to the MIT annotator repo + a ``/own-model`` setup guide. Framed on the real moat (ownership/licensing/privacy), not accuracy, and not "one-click."

#### Where things stand / your call

- **\*\*GPU:\*\*** still deferred to your **\*\*Windows+WSL box\*\*** (no cloud GPU ? both providers gated; no Gemini e2e), per your earlier choice.
- **\*\*Next, pick any:\*\*** I can **\*\*build the ``own-model.html`` page\*\*** from the approved mockup (with labeled screenshot placeholders until you supply consented, no-minors footage); **\*\*continue per-rally P2\*\*** (grid + selection, mock-verified); or **\*\*run real WASB e2e on the Windows+WSL box\*\*** when you want it.

What would you like next?

### 376. user (2026-06-20T13:57:43.400Z)

Canyou also add some content stating that [https://youtu.be/ajTCZ7pJW\\_o](https://youtu.be/ajTCZ7pJW_o) was produced by the tool. It has me and another guy who is not very clearly visible so should be OK. And it is an unlisted link

### 377. assistant (2026-06-20T14:00:48.152Z)

Adding it ? a real reel made by the tool is great social proof. Two honest notes up front, then I'll build it:

1. **\*\*Putting an unlisted link on the public landing page makes it viewable by anyone who visits\*\*** (the "unlisted" privacy is effectively gone for site visitors). If you'd rather keep it gated, I can put it behind the invite/app instead ? say the word.
2. I'll respect your call on the other person ("not clearly visible") since it's your footage; I'll use a **\*\*click-to-play\*\*** embed (no autoload, ``youtube-nocookie`` domain) so it's privacy-light.

Let me branch and read the exact spots to edit cleanly.

### 378. user (2026-06-20T14:00:52.708Z)

```
branch 'feat/demo-reel-video' set up to track 'origin/master'.
Switched to a new branch 'feat/demo-reel-video'

540 var f = document.getElementById('af');
541 if(!f) return;
```

```
542 f.addListener('change', function(e){
543 if(e.target.name === 'segment') f.classList.toggle('is-academy', e.target.value ===
'academy');
```

### 383. assistant (2026-06-20T14:01:35.725Z)

All anchors captured. Making the four edits (CSS, hero CTA link, the section, the click-to-play script):

### 384. user (2026-06-20T14:01:40.003Z)

The file C:\Users\avidu\Projects\khelsutra\site\public\index.html has been updated successfully. (file state is current in your context ? no need to Read it back)

### 385. user (2026-06-20T14:01:41.276Z)

The file C:\Users\avidu\Projects\khelsutra\site\public\index.html has been updated successfully. (file state is current in your context ? no need to Read it back)

### 386. assistant (2026-06-20T14:01:46.486Z)

Now insert the reel section and the click-to-play script:

### 387. user (2026-06-20T14:01:51.233Z)

The file C:\Users\avidu\Projects\khelsutra\site\public\index.html has been updated successfully. (file state is current in your context ? no need to Read it back)

### 388. user (2026-06-20T14:01:54.574Z)

The file C:\Users\avidu\Projects\khelsutra\site\public\index.html has been updated successfully. (file state is current in your context ? no need to Read it back)

### 389. assistant (2026-06-20T14:02:04.575Z)

Now add a regression guard for the demo content in the static-asset test. Let me read it:

### 390. user (2026-06-20T14:02:04.877Z)

```
1 // Static-site integrity ? the landing page + capture checklist + OG image ARE the
public
2 // product. server.test.js proves the VM host *serves* "/", "/capture", "/og.png"; this
3 // guards the CONTENT contract so a broken edit (deleted asset, broken form wiring, dead
4 // capture link, missing/!absolute OG image) fails CI instead of shipping to the live
site.
5 import { test } from "node:test";
6 import assert from "node:assert/strict";
7 import { readFileSync, statSync } from "node:fs";
8 import { join } from "node:path";
9
10 const PUBLIC = join(import.meta.dirname, "..", "public");
11 const read = (f) => readFileSync(join(PUBLIC, f), "utf8");
12 const size = (f) => statSync(join(PUBLIC, f)).size;
13
14 test("core public assets exist and are non-empty", () => {
15 for (const f of ["index.html", "capture.html", "og.png"]) {
16 assert.ok(size(f) > 0, `public/${f} is missing or empty`);
17 }
18 });
19
20 test("landing page wires the Request-Access form to the API", () => {
21 const html = read("index.html");
22 assert.match(html, /id="af"/, "the #af form is gone");
```

```

23 assert.match(html, /\api\/request-access/, "form no longer posts to /api/request-
access");
24 assert.match(html, /name="company"[^>]*tabindex="-1"/, "honeypot field removed (bots
will get through)");
25 for (const field of ["segment", "has_gpu", "storage"]) {
26 assert.match(html, new RegExp(`name="${field}"`), `form lost the '${field}' field (a
demand signal)`);
27 }
28 });
29
30 test("OG + canonical meta point at the live https origin", () => {
31 const html = read("index.html");
32 assert.match(html,
/property="og:image"\s+content="https:\/\/khelsutra.guru\/og.png"/, "og:image must be the
absolute live URL");
33 assert.match(html, /property="og:url"\s+content="https:\/\/khelsutra.guru"/, "og:url
drift");
34 });
35
36 test("the capture checklist is linked and is a real page", () => {
37 assert.match(read("index.html"), /href="\capture(\.html)?"/, "footer capture-
checklist link is gone");
38 const cap = read("capture.html");
39 assert.match(cap, /<html/i, "capture.html is not HTML");
40 assert.match(cap, /capture checklist/i, "capture.html lost its checklist content");
41 });
42

```

### 391. user (2026-06-20T14:02:19.506Z)

The file C:\Users\avidu\Projects\khelsutra\site\src\assets.test.js has been updated successfully. (file state is current in your context ? no need to Read it back)

### 392. assistant (2026-06-20T14:02:31.712Z)

Now verify ? run the site tests and preview the page:

### 393. user (2026-06-20T14:02:35.155Z)

? the sample reel (made by KhelSutra) is embedded click-to-play (0.9942ms)  
? tests 29  
? pass 29  
? fail 0

### 394. assistant (2026-06-20T14:02:52.442Z)

29/29 green (incl. the new reel guard). Now preview the page to confirm the reel section renders. Let me add a static-serve launch config and start it:

### 395. user (2026-06-20T14:02:52.616Z)

```

1 {
2 "version": "0.0.1",
3 "configurations": [
4 {
5 "name": "landing",
6 "runtimeExecutable": "python",
7 "runtimeArgs": ["-m", "http.server", "8099", "--directory", "artifacts/landing"],
8 "port": 8099
9 },
10 {
11 "name": "khelsutra-web",
12 "runtimeExecutable": "npm",
13 "runtimeArgs": ["--prefix", "C:/Users/avidu/Projects/khelsutra/web", "run", "dev",

```

```
"--", "--port", "5174", "--strictPort"],
14 "port": 5174
15 }
16]
17 }
18
```

#### 396. user (2026-06-20T14:02:59.253Z)

The file C:\Users\avidu\Projects\badminton-highlight-indexer\.claude\launch.json has been updated successfully. (file state is current in your context ? no need to Read it back)

#### 397. user (2026-06-20T14:03:06.221Z)

```
{
 "serverId": "c1cf2542-be4a-47c1-a73f-b1e1f5f75487",
 "port": 8123,
 "name": "khelsutra-site",
 "reused": false
}
```

Server started successfully on port 8123.

#### 398. assistant (2026-06-20T14:03:14.792Z)

Static server up. Let me scroll to the new reel section and capture it (plus check for console errors):

#### 399. user (2026-06-20T14:03:16.514Z)

```
"{\\"hasSection\\":true,\\"hasButton\\":true,\\"bg\\":\\"url(\\\\"https://i.ytimg.com/vi/ajTCZ7pJW_o/hqdefault.jpg\\\\"}\\",\\"watchLink\\":true}"
```

#### 400. assistant (2026-06-20T14:03:25.550Z)

Section, play button, thumbnail, and the hero "Watch a real reel" link all present. Screenshot to confirm visuals:

#### 401. assistant (2026-06-20T14:03:51.232Z)

Renders perfectly ? the reel thumbnail loads (it even carries the baked-in "Generated by Khelsutra.guru" watermark), the lime play button overlays, and the attribution caption shows. The hero "Watch a real reel" link is wired too. Let me stop the preview and ship it:

#### 402. user (2026-06-20T14:03:51.858Z)

Server c1cf2542-be4a-47c1-a73f-b1e1f5f75487 stopped

#### 409. assistant (2026-06-20T14:05:48.666Z)

? **Live and verified** ? the "A real reel, made by KhelSutra" section is now on **khelsutra.guru** (auto-deployed on merge of [khelsutra#17](https://github.com/avidullu/khelsutra/pull/17)). Let me record it:

#### 410. user (2026-06-20T14:05:53.473Z)

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md has been updated successfully. (file state is current in your context ? no need to Read it back)

#### 411. assistant (2026-06-20T14:06:11.189Z)

Done ? it's live.

#### ? Shipped ? [khelsutra#17](https://github.com/avidullu/khelsutra/pull/17) (merged, auto-deployed, **verified** li

A **"A real reel, made by KhelSutra"** section on the landing page, plus a **"Watch a real reel"** link in the hero. It states the reel was produced by the tool, with a click-to-play

embed of your video (`ajTCZ7pJW\_o`).

- **Privacy-light by construction:** a **click-to-play facade** ? the page shows only the thumbnail + play button; YouTube isn't loaded (no cookies/tracking) until someone clicks, and then via the `youtube-nocookie.com` domain.
- Honest caption: **"Generated by Khelsutra.guru ? a real recorded session, cut automatically."**
- Guarded by a CI test (`assets.test.js`) so it can't be silently dropped; site suite **29 green**; rendered-verified in-browser before merge.

## Two things to keep in mind (you can reverse either instantly)

1. **The unlisted link is now effectively public to site visitors** ? anyone on khelsutra.guru can play it. That's the intended social-proof, but if you'd rather keep it gated, I can move it behind the invite/app in one PR. The video stays **yours on YouTube** ? unlisting/deleting it there cuts access immediately, and removing the section is a one-commit revert.
2. **The second person** appears (at a distance) in the thumbnail/video ? you judged it fine; flagging only so it's a conscious call. Best practice if you want extra safety: confirm they're OK appearing, or I can swap to a frame/clip where they're not in shot.

Want me to **gate it behind the app instead**, **swap the thumbnail**, or leave it public as-is? And otherwise ? back to the build queue whenever you like (per-rally **P2**, the `own-model.html` page, or real WASB e2e on your Windows+WSL box).

### 412. user (2026-06-20T14:06:14.010Z)

can you also help deploy this to both khelsutra and making sure the local droplet srv/ copy is also updated

### 413. assistant (2026-06-20T14:07:15.339Z)

Cloudflare ("khelsutra") is already done ? PR #17 auto-deployed and I verified the reel is live on khelsutra.guru. The remaining piece is the **droplet `srv/khelsutra-site` twin**, which doesn't auto-deploy. Let me inspect it first (staying strictly within `srv/khelsutra-site` ? not touching the decoupled session's `~/rally`/MinIO/GCS ports), then update + parity-check.

### 414. user (2026-06-20T14:07:22.466Z)

### 415. assistant (2026-06-20T14:09:39.930Z)

The droplet twin is healthy (Node 26, systemd `khelsutra-site`, `access.db` preserved) but **\*\*not yet updated\*\*** (no reel) ? and your new instruction changes the design anyway, so I'll rework first, then bring the droplet straight to the new version.

**\*\*New behavior:\*\*** gate the reel behind sign-up ? a "Sign up to see it in action" teaser, and the sample clip reveals on successful submit, auto-closing in 90s. That also resolves the public-exposure concern. Let me locate the exact spots to edit.

#### 416. user (2026-06-20T14:09:41.646Z)

```
285- <div class="wrap">
286: <div class="sec-head" style="text-align:center;max-width:none">

```

#### 417. assistant (2026-06-20T14:10:07.183Z)

All anchors confirmed. Branching and reworking the reel into the sign-up-gated reveal:

#### 418. user (2026-06-20T14:10:11.298Z)

```
branch 'feat/reel-on-signup' set up to track 'origin/master'.
Switched to a new branch 'feat/reel-on-signup'
feat/reel-on-signup
6e4e07b feat(site): showcase a real reel made by the tool (click-to-play, privacy-light) (#17)
```

#### 419. user (2026-06-20T14:10:43.731Z)

The file C:\Users\avidu\Projects\khelsutra\site\public\index.html has been updated successfully.  
(file state is current in your context ? no need to Read it back)

#### 420. user (2026-06-20T14:10:45.174Z)

The file C:\Users\avidu\Projects\khelsutra\site\public\index.html has been updated successfully.  
(file state is current in your context ? no need to Read it back)

#### 421. user (2026-06-20T14:10:54.429Z)

The file C:\Users\avidu\Projects\khelsutra\site\public\index.html has been updated successfully.  
(file state is current in your context ? no need to Read it back)

#### 422. user (2026-06-20T14:11:01.553Z)

The file C:\Users\avidu\Projects\khelsutra\site\public\index.html has been updated successfully.  
(file state is current in your context ? no need to Read it back)

**423. user (2026-06-20T14:11:08.991Z)**

The file C:\Users\avidu\Projects\khelsutra\site\public\index.html has been updated successfully.  
(file state is current in your context ? no need to Read it back)

**424. user (2026-06-20T14:11:15.355Z)**

The file C:\Users\avidu\Projects\khelsutra\site\public\index.html has been updated successfully.  
(file state is current in your context ? no need to Read it back)

**425. user (2026-06-20T14:11:26.629Z)**

The file C:\Users\avidu\Projects\khelsutra\site\public\index.html has been updated successfully.  
(file state is current in your context ? no need to Read it back)

**426. assistant (2026-06-20T14:11:35.676Z)**

All page edits done. Now update the test for the new gated behavior:

**427. user (2026-06-20T14:11:36.490Z)**

```
36 test("the sample reel (made by KhelSutra) is embedded click-to-play", () => {
37 const html = read("index.html");
38 assert.match(html, /ajTCZ7pJW_o/, "the sample-reel video id is gone");
39 assert.match(html, /youtube-nocookie\.com\/embed\/ajTCZ7pJW_o/, "reel should use the
privacy nocookie embed");
40 assert.match(html, /id="reel-play"/, "the click-to-play facade button is gone");
41 assert.match(html, /made by KhelSutra/i, "the 'made by KhelSutra' attribution is
gone");
42 });
43
```

**428. user (2026-06-20T14:11:46.550Z)**

The file C:\Users\avidu\Projects\khelsutra\site\src\assets.test.js has been updated successfully. (file state is current in your context ? no need to Read it back)

**429. assistant (2026-06-20T14:12:22.755Z)**

Now verify. First the test suite, then I'll drive the real submit?reveal flow against the Node server (the static preview can't process the form POST):

**430. user (2026-06-20T14:12:26.403Z)**

```
? the sample reel is GATED behind sign-up (revealed on submit, not shown openly)
(0.7409ms)
? tests 29
? pass 29
? fail 0
```

**431. assistant (2026-06-20T14:12:31.698Z)**

29/29 green. Now drive the real \*\*submit ? reveal\*\* flow against the Node server. Adding a launch config and starting it:

**432. user (2026-06-20T14:12:34.891Z)**

The file C:\Users\avidu\Projects\badminton-highlight-indexer\.claude\launch.json has been updated successfully. (file state is current in your context ? no need to Read it back)

**433. user (2026-06-20T14:12:43.645Z)**

```
{
```

```
"serverId": "50973077-fa55-49d4-9f39-5982957826ba",
"port": 8080,
"name": "khelsutra-node",
"reused": false
}
Server started successfully on port 8080.
```

#### 434. assistant (2026-06-20T14:12:56.193Z)

Node server up. Driving the form ? fill, select segment, submit:

#### 435. user (2026-06-20T14:12:57.331Z)

Successfully filled: #af-name

#### 436. user (2026-06-20T14:12:58.667Z)

Successfully filled: #af-email

#### 437. user (2026-06-20T14:12:59.200Z)

Successfully clicked: input[name="segment"][value="individual"]

#### 438. assistant (2026-06-20T14:13:04.927Z)

Now submit and verify the reveal:

#### 439. user (2026-06-20T14:13:05.337Z)

Successfully clicked: #af button[type="submit"]

#### 440. user (2026-06-20T14:13:15.913Z)

```
{\"thanksShown\":true,\"revealShown\":true,\"iframeSrc\":\"https://www.youtube-nocookie.com/embed/ajTCZ7pJW_o?autoplay=1&rel=0&modestbranding=1\", \"countdown\":\"80\", \"formHidden\":true}
```

#### 441. assistant (2026-06-20T14:13:27.797Z)

**\*\*Submit ? reveal works end to end:\*\*** form hidden, thanks shown, the sample reel revealed (nocookie autoplay), and the countdown is ticking (90 ? 80, proving auto-close fires at 0). Screenshot for proof:

#### 442. assistant (2026-06-20T14:13:38.944Z)

The gated flow is verified live: after sign-up the reel autoplays with "Generated by Khelsutra.guru · closing in 68s" (counting down to auto-close), and it's no longer shown openly. Stop the preview and ship:

#### 443. user (2026-06-20T14:13:39.483Z)

Server 50973077-fa55-49d4-9f39-5982957826ba stopped

Already on 'master'
Already up to date.
222f2eb feat(site): gate the sample reel behind sign-up + auto-close in 90s (#18)
```

#### 451. assistant (2026-06-20T14:15:18.354Z)

Master synced (`222f2eb`). Now update the droplet twin ? push the new `site/` to `~/.srv/khelsutra-site/site`, restart, verify (staying strictly within the site dir):

#### 452. user (2026-06-20T14:15:29.769Z)

```
=== push new site/ (master HEAD) -> /srv/khelsutra-site/site ===
=== restart service + verify (access.db + node symlink untouched) ===
active
reel-reveal(gated): 2 open-section(should be 0): 0 form: 1
=== state DB preserved? ===
-rw-r--r-- 1 root root 12288 Jun 20 07:26 /srv/khelsutra-site/access.db
rows:0
```

#### 453. assistant (2026-06-20T14:15:42.849Z)

Droplet updated: service **\*\*active\*\***, the gated reel present (`reel-reveal`), **\*\*no open section\*\*** (0), form intact, and `access.db` preserved. Now the parity check ? confirm both live hosts serve byte-identical pages:

#### 454. user (2026-06-20T14:15:45.954Z)

```
Exit code 1
DRIFT / cf=231dd9073cba5b14ccb917668a0ba74f vm=dc6aebd156dd8bc57db99f5468ecd9e3
DRIFT /capture cf=2ada2cfccf855c0d6b31d7bb818e9f29 vm=617a68c48c9fcde11a34c4dbe85808db
PARITY: DRIFT ? re-sync the droplet from git (LF):
git -C <repo> archive HEAD:site | ssh root@<vm> tar -x -C /srv/khelsutra-site/site
```

#### 455. assistant (2026-06-20T14:16:44.345Z)

Parity drift on **\*\*both\*\*** files (including `/capture`, which I didn't touch) ? that signature points to a **\*\*line-ending mismatch\*\*** introduced by my `git archive | tar` extraction (CRLF on the droplet vs LF on Cloudflare), not my content change. Let me diagnose precisely:

#### 456. user (2026-06-20T14:16:50.708Z)

```
canonical LF blob (git show): 231dd9073cba5b14ccb917668a0ba74f
Cloudflare served (/): 231dd9073cba5b14ccb917668a0ba74f
droplet served (:8787 /): dc6aebd156dd8bc57db99f5468ecd9e3
--- droplet file: CRLF present? (count of \r) ---
index.html CR count: 601
capture.html CR count: 132
```

#### 457. assistant (2026-06-20T14:17:29.099Z)

Confirmed: the droplet files are **\*\*CRLF\*\*** (601/132 CRs) while Cloudflare serves the canonical **\*\*LF\*\*** blob (`231dd90?` = `git show` = CF, identical). My `git archive` on Windows injected CRLF. Let me find the LF-producing invocation and check `.gitattributes`:

#### 458. user (2026-06-20T14:17:33.111Z)

```
=== .gitattributes ===
```

**Deterministic line endings so every checkout / scp / host serves byte-identical files (the droplet vs Cloudflare CRLF-vs-LF drift, 2026-06-20). Text = LF everywhere.**

```
* text=auto eol=lf
*.png binary
*.jpg binary
*.jpeg binary
*.ico binary
*.woff binary
*.woff2 binary
=== md5 of index.html via different extraction methods (target LF =
231dd9073cba5b14ccb917668a0ba74f) ===
default archive: dc6aebd156dd8bc57db99f5468ecd9e3
autocrlf=false archive: 231dd9073cba5b14ccb917668a0ba74f
autocrlf=false+eol=lf: 231dd9073cba5b14ccb917668a0ba74f
```

#### 459. assistant (2026-06-20T14:17:49.793Z)

Root cause nailed: `.gitattributes` says `eol=lf`, but **\*\*Windows `core.autocrlf=true` overrides `git archive`\*\*** ? CRLF. `git -c core.autocrlf=false archive` produces the correct LF (`231dd90?`). Re-extracting the droplet with the LF-safe command, then re-checking parity:

#### 460. user (2026-06-20T14:18:00.625Z)

```
=== re-extract with autocrlf=false (LF) ===
```

```
active
index CR count (want 0): 0
=== parity check (CF vs droplet) ===
OK / 231dd9073cba5b14ccb917668a0ba74f
OK /capture 2ada2cfccf855c0d6b31d7bb818e9f29
PARITY: in sync
```

#### 461. assistant (2026-06-20T14:18:29.405Z)

**\*\*Parity restored ? both hosts byte-in-sync\*\*** (`OK / 231dd90`, `OK /capture 2ada2cf`, `PARITY: in sync`), with the gated reel live on Cloudflare *and* the droplet twin. CR count now 0.

That same bug lives in the shipped `provision-vm.sh` (plain `git archive` ? CRLF when run from a Windows operator). Let me fix the scripts so a fresh VM never drifts. Branch + read the exact lines:

#### 462. user (2026-06-20T14:18:33.983Z)

```
branch 'fix/archive-lf-crossplatform' set up to track 'origin/master'.
Switched to a new branch 'fix/archive-lf-crossplatform'
fix/archive-lf-crossplatform
```

#### 463. user (2026-06-20T14:18:34.118Z)

```
site\scripts\provision-vm.sh:30:git -C "$REPO" archive HEAD:site | ssh "${SSH0[@]}"
"$SSH_TARGET" "tar -x -C '$DIR/site'"
site\scripts\parity-check.sh:20: echo " git -C <repo> archive HEAD:site | ssh root@<vm> tar -x
-C /srv/khelsutra-site/site"
```

#### 464. user (2026-06-20T14:18:41.329Z)

The file C:\Users\avidu\Projects\khelsutra\site\scripts\provision-vm.sh has been updated successfully. (file state is current in your context ? no need to Read it back)

#### 465. user (2026-06-20T14:18:43.231Z)

The file C:\Users\avidu\Projects\khelsutra\site\scripts\parity-check.sh has been updated successfully. (file state is current in your context ? no need to Read it back)

#### 466. assistant (2026-06-20T14:18:50.605Z)

LF-safe now. Syntax-check and ship the fix:

#### 467. user (2026-06-20T14:18:56.138Z)

#### 470. assistant (2026-06-20T14:20:19.548Z)

All shipped. #19 merged, master `cc5cd4d`. Let me update the checkpoint, then summarize.

#### 471. user (2026-06-20T14:20:28.345Z)

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md has been updated successfully. (file state is current in your context ? no need to Read it back)

#### 472. assistant (2026-06-20T14:20:43.818Z)

Done ? deployed to both hosts, with your new gating, and I caught + fixed a real bug along the way.

### ? Reel reworked to sign-up-gated ? [khelsutra#18](https://github.com/avidullu/khelsutra/pull/18) (merged, live)

Per your change: the reel is **no longer shown openly**. Instead:

- A **"Sign up to see it in action"** teaser (+ hero "See a sample reel" ? the form).
- On a **successful request-access submit**, it reveals the sample clip (`youtube-nocookie` autoplay) that **auto-closes after 90s** with a live "closing in Ns" countdown.
- **Verified live** against the Node host: fill ? submit ? form hides ? reel plays ? countdown ticked 90 ? 68 ? auto-closes. This also tightens privacy ? the clip only plays for people who sign up, not every visitor/crawler.

### ? Deployed to BOTH hosts + parity green

- **Cloudflare (khelsutra.guru):** auto-deployed on merge.
- **Droplet ` /srv/khelsutra-site` twin:** re-synced to `master` and restarted (only the site dir touched ? `access.db` + the self-contained Node 26 preserved; the decoupled session's `~/rally`/MinIO/GCS left alone).
- **PARITY:** in sync ? both serve byte-identical pages (`OK / 231dd90`, `OK /capture 2ada2cf`).

### ? Found + fixed a CRLF drift bug ? [khelsutra#19](https://github.com/avidullu/khelsutra/pull/19) (merged)

Syncing the droplet drifted parity on **every** file. Root cause: on **Windows**, `core.autocrlf=true` **overrides** `.gitattributes eol=lf` in `git archive` ? CRLF on the VM vs Cloudflare's LF. I re-synced the droplet with the LF-safe command (drift cleared) and hardened the portability scripts (`provision-vm.sh` + `parity-check.sh`) to pin `git -c core.autocrlf=false archive` ? so a future fresh-VM provision from a Windows machine won't drift.

**\*\*Net:\*\*** master `cc5cd4d`, no open PRs, both hosts live + in-sync with the gated reel. Next up whenever you want: per-rally **\*\*P2\*\***, the `own-model.html` page, or real WASB e2e on your Windows+WSL box.

#### 473. user (2026-06-20T14:20:45.633Z)

is it possible to start this video from a randomly chosen point atleast 90s before the end? So not everybody sees the same chunk every time?

#### 474. assistant (2026-06-20T14:23:14.899Z)

Yes ? that's a nice touch, and it's doable. YouTube embeds can't know the video length from the URL alone, so I'll use the **\*\*IFrame Player API\*\***: on load, read `getDuration()`, pick a random start in `[0, duration - 90]` (guaranteeing 90s remain), `seekTo` it, and keep the 90s auto-close. Different chunk each sign-up.

Let me branch and find the exact reveal code to replace:

#### 475. user (2026-06-20T14:23:19.248Z)

branch 'feat/reel-random-start' set up to track 'origin/master'.  
Switched to a new branch 'feat/reel-random-start'  
feat/reel-random-start

#### 476. user (2026-06-20T14:23:19.407Z)

```
214: .reelwrap iframe{width:100%;height:100%;border:0;display:block}
524: <div id="reel-reveal" hidden></div>
548: if(!f) return;
583: if(ok){

591 var n = 90, el = document.getElementById('reel-count');
592 var iv = setInterval(function(){ n--; if(el){ el.textContent = n; } if(n <= 0){
clearInterval(iv); host.innerHTML = ''; host.hidden = true; } }, 1000);
593 }

```

#### 480. user (2026-06-20T14:23:56.436Z)

435: <details><summary>How do I join?</summary><p>It's an invite-only private trial. The best next step is to let us record a session and show you your own court and players as a reel. Email <a href="mailto:hello@khelsutra.guru">hello@khelsutra.guru</a>.</p></details>

#### 481. assistant (2026-06-20T14:24:36.556Z)

All anchors found. Making the edits ? random-start reel + the form-consistent "How do I join?" FAQ:

#### 482. user (2026-06-20T14:24:45.093Z)

The file C:\Users\avidu\Projects\khelsutra\site\public\index.html has been updated successfully. (file state is current in your context ? no need to Read it back)

#### 483. user (2026-06-20T14:24:54.772Z)

The file C:\Users\avidu\Projects\khelsutra\site\public\index.html has been updated successfully. (file state is current in your context ? no need to Read it back)

#### 484. user (2026-06-20T14:24:57.803Z)

The file C:\Users\avidu\Projects\khelsutra\site\public\index.html has been updated successfully. (file state is current in your context ? no need to Read it back)

#### 485. assistant (2026-06-20T14:25:12.349Z)

Now the tests ? update the reel guard for the Player-API/random-start, and add a guard for the form-consistent join FAQ:

#### 486. user (2026-06-20T14:25:19.039Z)

The file C:\Users\avidu\Projects\khelsutra\site\src\assets.test.js has been updated successfully. (file state is current in your context ? no need to Read it back)

#### 487. user (2026-06-20T14:25:29.084Z)

The file C:\Users\avidu\Projects\khelsutra\site\src\assets.test.js has been updated successfully. (file state is current in your context ? no need to Read it back)

#### 488. assistant (2026-06-20T14:25:34.357Z)

Now verify ? run the tests, then drive the submit?reveal to confirm the random start:

#### 489. user (2026-06-20T14:25:37.988Z)

? the sample reel is GATED behind sign-up + starts at a RANDOM point (not shown openly)

```
(1.0769ms)
? the 'How do I join?' FAQ points at the request-access form, not email (3.1436ms)
? tests 30
? pass 30
? fail 0
```

**490. assistant (2026-06-20T14:25:50.647Z)**

30/30 green. Now drive the real flow against the Node host to confirm the random start:

**491. user (2026-06-20T14:25:53.701Z)**

```
{
 "serverId": "e84afe28-27c2-424a-a902-d2a797f2f4a8",
 "port": 8080,

0ce6a30 feat(site): random start point for the sample reel + form-consistent "How do I join"
(#20)
```

#### 510. assistant (2026-06-20T14:28:17.998Z)

#20 merged (CF auto-deploying). Now re-sync the droplet twin (LF-safe) and confirm parity:

#### 511. user (2026-06-20T14:28:30.077Z)

```
Exit code 1
active
getDuration: 1 join->#join: 1 CR: 0
=== parity ===
DRIFT / cf=231dd9073cba5b14ccb917668a0ba74f vm=848312849fb404adc656652b9d34e5c8
OK /capture 2ada2cfccf855c0d6b31d7bb818e9f29
PARITY: DRIFT ? re-sync the droplet from git (LF):
git -C <repo> -c core.autocrlf=false archive HEAD:site | ssh root@<vm> tar -x -C
/srv/khelsutra-site/site
```

#### 512. assistant (2026-06-20T14:28:46.838Z)

Not a real drift ? the droplet has the new version (`getDuration:1`, CR:0, join FAQ updated), but **Cloudflare is still serving the previous build** (`cf=231dd90` = the pre-random-start #18). The master-merge deploy is still propagating. Let me wait for CF to catch up, then re-check parity:

#### 513. user (2026-06-20T14:28:57.815Z)

```
CF now serving #20 (getDuration present) after ~0s
--- parity ---
OK / 848312849fb404adc656652b9d34e5c8
OK /capture 2ada2cfccf855c0d6b31d7bb818e9f29
PARITY: in sync
```

#### 514. assistant (2026-06-20T14:29:14.798Z)

**CF deployed #20 and parity is green** (`OK / 848312?`, `OK /capture`, `PARITY: in sync`). The earlier line was just CF propagation lag. Let me record the checkpoint.

#### 515. user (2026-06-20T14:29:18.952Z)

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md has been updated successfully. (file state is current in your context ? no need to Read it back)

#### 516. assistant (2026-06-20T14:29:34.320Z)

Both done and live on both hosts.

### ? Random start point ? [khelsutra#20](https://github.com/avidullu/khelsutra/pull/20) (merged, live)

Yes, it's possible ? and done. On each sign-up the reel now uses the YouTube **IFrame Player API** to read the real `getDuration()`, pick a **random start** in `[0, duration ? 90]` (so there's always 90s left), `seekTo` it, and keep the 90s auto-close. Falls back to start=0 if the duration isn't available.

- **Verified live:** two sign-ups started at **35s** then **20s** ? a different chunk each time, each 90s before the end.

### ? "How do I join?" FAQ ? form-consistent, no email

Now: **"It's an invite-only private trial. Just request access"** using the form ? it takes a minute, you'll see a real sample reel right away, and we'll be in touch?" ? links to `#join`, drops the `mailto`. A test guards that the join FAQ uses the form, not email.

### Deployed to both, in sync

- **Cloudflare** auto-deployed; **droplet twin** re-synced (LF-safe) ? **PARITY: in sync** (`848312?`).
- Site suite **30 green**; master `0ce6a30`; no open PRs.

One small caveat worth noting: the random start relies on the browser's YouTube Player API loading after sign-up (a second or two); if it can't read the duration it safely starts at 0. Everything else (gating, 90s auto-close, privacy via `youtube-nocookie`) is unchanged.

Want me to tune anything (e.g., a different clip length than 90s, or a minimum start offset so it never opens on the very first seconds), or move on to the next thread (per-rally \*\*P2\*\*, the `own-model.html` page, or real WASB e2e on your Windows+WSL box)?

**517. user (2026-06-20T14:32:36.907Z)**

Please continue your P2 and the own model page. I have created an organization named Khelsutra in github, can you tell me if the rally-annotator repo can be moved to it and I am happy to give up ownership.

**518. assistant (2026-06-20T14:34:18.246Z)**

Three things ? I'll answer the org question first (quick check), then build P2 and the own-model page.

**519. user (2026-06-20T14:34:25.025Z)**

```
=== org exists? ===
function not defined: public_repos/0
=== my role in the org ===
{"role":"admin","state":"active"}
=== name conflict? (rally-annotator already in org) ===
gh: Not Found (HTTP 404)
{"message":"Not Found","documentation_url":"https://docs.github.com/rest/repos/repos#get-a-repository","status":"404"}
=== can I create repos in the org? ===
true
```

**520. assistant (2026-06-20T14:35:20.588Z)**

**\*\*Yes ? the `rally-annotator` repo can be moved to the `Khelsutra` org.\*\*** I checked, and all conditions are met:

- You're an **\*\*owner/admin\*\*** of the `Khelsutra` org (so it can receive transfers and you keep full control).
- **\*\*No name conflict\*\*** ? there's no `rally-annotator` in the org yet.

What a transfer does: keeps issues/PRs/stars/Actions/releases, and **\*\*GitHub auto-redirects\*\*** the old `avidullu/rally-annotator` URL to `Khelsutra/rally-annotator`, so existing clones/links (incl. the site's link) keep working. "Giving up ownership" just means the **\*\*org\*\*** owns it ? you stay an org owner, so you don't lose access. The only follow-up: I'd update the site + doc links to the new canonical URL. It's a "Danger Zone" action and reversible (you can transfer back).

I can run it for you with `gh api repos/avidullu/rally-annotator/transfer -f new\_owner=Khelsutra` and then update the links ? **\*\*say the word and I'll do it\*\***, or you can click it in repo Settings. (I won't transfer unprompted since it changes ownership + URLs.)

Now, onto **\*\*P2\*\***. Let me branch and build the rally grid + selection hook.

**521. user (2026-06-20T14:35:24.579Z)**

```
branch 'feat/per-rally-p2-grid' set up to track 'origin/master'.
Switched to a new branch 'feat/per-rally-p2-grid'
feat/per-rally-p2-grid
0ce6a30 feat(site): random start point for the sample reel + form-consistent "How do I join" (#20)
```

**522. assistant (2026-06-20T14:35:35.851Z)**

```
// Small pure formatters (node-testable, no React).
```

```

/** Seconds ? "m:ss" (e.g. 65 ? "1:05"). Rounds to the nearest second; clamps negatives to 0. */
export function mmss(totalSeconds: number): string {
 const s = Math.max(0, Math.round(totalSeconds || 0));
 const m = Math.floor(s / 60);

 });
});
```

### 534. user (2026-06-20T14:36:50.099Z)

File created successfully at: C:\Users\avidu\Projects\khelsutra\web\src\lib\selection.test.ts (file state is current in your context ? no need to Read it back)

### 535. assistant (2026-06-20T14:36:59.512Z)

Now rewrite `App.tsx` to render the grid with a sticky selection footer. Reading it first:

### 536. user (2026-06-20T14:36:59.809Z)

```
1 export default function App() {
2 return (
3 <main className="min-h-screen bg-paper text-ink">
4 <header className="bg-ink text-white">
5 <div className="mx-auto flex max-w-5xl items-center gap-1 px-6 py-4">
6
7 Khel?Sutra{" "}
```

```

8 Studio
9
10 </div>
11 </header>
12
13 <section className="mx-auto max-w-5xl px-6 py-16">
14 <span className="inline-flex rounded-full bg-green/15 px-3 py-1 text-xs font-
semibold text-green">
15 operator console · scaffold (M1)
16
17 <h1 className="mt-4 text-3xl font-extrabold tracking-tight">
18 Drive the rally indexer from the browser
19 </h1>
20 <p className="mt-3 max-w-2xl text-ink/70">
21 The web SPA that runs the loop: upload ? index ? pick rallies ? reel ?
download.
22 This is the scaffold; the screens land next (see
<code>docs/PER_RALLY_SELECTION.md</code> and{" "}
23 <code>docs/LOCAL_APPLIANCE_ARCHITECTURE.md</code>).
24 </p>
25 <ul className="mt-6 space-y-1 text-sm text-ink/70">
26 ? Typed engine API client (<code>src/api/client.ts</code>) ? query ·
compile · highlights · config
27 ? Dev proxy <code>/api ? :8000</code> (same-origin in the appliance)
28 ? Structured client logging with correlation IDs
(<code>src/lib/log.ts</code>)
29
30 </section>
31 </main>
32);
33 }
34

```

### 537. assistant (2026-06-20T14:37:21.593Z)

```

import { useRallySelection } from "../hooks/useRallySelection";
import { RallyGrid } from "../components/RallyGrid";
import { mmss, pluralize } from "../lib/format";
import type { RallySegment } from "../api/types";

// Demo data until the picker is wired to the engine (POST /api/query) in the MVP flow (P5).
// Shape matches the verified play_segments contract; only honest fields are shown.
const DEMO_RALLIES: RallySegment[] = [
 { id: 1, start_time: 12, end_time: 20, duration: 8, server: null, receiver: null, metadata: {
shot_count: 9, shot_count_confidence: "High" } },
 { id: 2, start_time: 41, end_time: 47, duration: 6, server: null, receiver: null, metadata: {
shot_count: 5 } },
 { id: 3, start_time: 63, end_time: 84, duration: 21, server: null, receiver: null, metadata: {

 { id: 4, start_time: 95, end_time: 101, duration: 6, server: null, receiver: null, metadata:
{} },
 { id: 5, start_time: 130, end_time: 142, duration: 12, server: null, receiver: null, metadata:
{ shot_count: 11 } },
 { id: 6, start_time: 158, end_time: 187, duration: 29, server: null, receiver: null, metadata:
{ shot_count: 24, shot_count_confidence: "High" } },
];

export default function App() {
 const sel = useRallySelection(DEMO_RALLIES, "all");

 return (
 <main className="min-h-screen bg-paper text-ink pb-24">
 <header className="bg-ink text-white">
 <div className="mx-auto flex max-w-5xl items-center gap-1 px-6 py-4">

```

```

 Khel<span className="text-green"?Sutra <span className="font-semibold text-
lime">Studio

 </div>
 </header>

 <section className="mx-auto max-w-5xl px-6 py-10">
 <span className="inline-flex rounded-full bg-green/15 px-3 py-1 text-xs font-semibold
text-green">
 per-rally selection · P2

 <h1 className="mt-4 text-3xl font-extrabold tracking-tight">Pick the rallies for your
reel</h1>
 <p className="mt-2 max-w-2xl text-ink/70">
 Tap a rally to add or remove it. Everything starts selected ? just
drop the ones you don't
 want. (Demo data; the live list comes from the
engine.)
 </p>

 <div className="mt-5 flex flex-wrap gap-2 text-sm">
 <button type="button" onClick={sel.selectAll} className="rounded-full border border-
black/15 px-3 py-1 hover:border-green">Select all</button>
 <button type="button" onClick={sel.clearAll} className="rounded-full border border-
black/15 px-3 py-1 hover:border-green">Clear</button>
 <button type="button" onClick={sel.invert} className="rounded-full border border-
black/15 px-3 py-1 hover:border-green">Invert</button>
 </div>

 <div className="mt-5">
 <RallyGrid rallies={DEMO_RALLIES} isSelected={sel.isSelected} onToggle={sel.toggle} />
 </div>
 </section>

 <footer className="fixed inset-x-0 bottom-0 border-t border-black/10 bg-white/95 backdrop-
blur">
 <div className="mx-auto flex max-w-5xl items-center gap-4 px-6 py-3">

 <strong className="text-ink">{pluralize(sel.count, "rally", "rallies")}
selected · {mmss(sel.totalSec)} total

 <button
 type="button"
 disabled={sel.count === 0}
 title="Reel building wires up in P5"
 className="ml-auto rounded-full bg-green px-5 py-2 text-sm font-semibold
text-[#04140D] disabled:opacity-40"
 >
 Build reel ({sel.count})
 </button>
 </div>
 </footer>
</main>
);
}

```

**538. user (2026-06-20T14:37:21.637Z)**

The file C:\Users\avidu\Projects\khelsutra\web\src\App.tsx has been updated successfully. (file state is current in your context ? no need to Read it back)

**539. assistant (2026-06-20T14:37:27.132Z)**

Now the gate ? typecheck, tests, build:

#### 540. user (2026-06-20T14:37:35.558Z)

=== typecheck ===

```
> khelsutra-web@0.0.0 typecheck
> tsc --noEmit
```

=== test ===

```
? src/lib/format.test.ts (3 tests)
3ms
? src/lib/selection.test.ts (5 tests)
4ms
stdout | src/api/client.test.ts > compileReel > POSTs the
selection to /api/compile
stdout | src/api/client.test.ts > compileReel > POSTs the
selection to /api/compile
stdout | src/api/client.test.ts > error handling (loud, never silent)
> throws ApiError on a network failure
stderr | src/api/client.test.ts > error handling (loud, never silent)
> throws ApiError on a network failure
? src/api/client.test.ts (8 tests)
13ms
 Tests 16 passed (16)
 Duration 512ms (transform 116ms, setup 0ms, collect 163ms, tests 20ms,
environment 0ms, prepare 495ms)
=== build ===
dist/index.html 0.40 kB ? gzip:
0.27 kB

? built in 719ms
```

#### 541. assistant (2026-06-20T14:37:43.419Z)

16 tests pass, typecheck + build clean. Now the live CUJ check ? render the grid and verify selection updates the footer:

#### 542. user (2026-06-20T14:37:46.620Z)

```
{
 "serverId": "6597ccab-fec0-4498-a023-bdb8d426c2e8",
 "port": 5174,
 "name": "khelsutra-web",
 "reused": false
}
Server started successfully on port 5174.
```

#### 543. user (2026-06-20T14:37:54.049Z)

```
"{"initialSummary\\":\\"6 rallies selected · 1:22 total\\",\\"cardCount\\":6,\\"allSelected\\":true}"
```

#### 544. assistant (2026-06-20T14:38:03.441Z)

Initial state correct: \*\*6 rallies selected · 1:22 total\*\*, all default-ON (D8). Now deselect the longest rally and confirm the footer recomputes:

#### 545. user (2026-06-20T14:38:03.996Z)

Successfully clicked: button[aria-label^="Rally 6"]

#### 546. user (2026-06-20T14:38:12.735Z)

```
"{"summary\":"6 rallies selected · 1:22
total\","rally6Pressed\":"true\","buildLabel\":"Build reel (6)\"}"
```

**547. assistant (2026-06-20T14:38:38.637Z)**

Let me re-read the state (the re-render may not have flushed when I checked):

**548. user (2026-06-20T14:38:39.929Z)**

```
"{"summary\":"6 rallies selected · 1:22 total\","rally6Pressed\":"true\"}"
```

**549. assistant (2026-06-20T14:39:11.173Z)**

The click isn't toggling ? let me isolate whether it's the card path or the hook by clicking "Clear":

**550. user (2026-06-20T14:39:11.813Z)**

Successfully clicked: button

**551. assistant (2026-06-20T14:39:39.761Z)**

Let me check the console for a runtime error that could be breaking interactivity:

**552. user (2026-06-20T14:39:40.184Z)**

```

```

**553. assistant (2026-06-20T14:39:59.990Z)**

No runtime errors ? the app mounted cleanly. Let me toggle via a programmatic click (to rule out a click-dispatch quirk) and read after the re-render:

**554. user (2026-06-20T14:40:00.970Z)**

"clicked Rally 6, in reel"

**555. user (2026-06-20T14:40:07.435Z)**

```
{\"summary\": \"5 rallies selected · 0:53 total\", \"rally6\": \"Rally 6, not in reel\", \"pressed\": \"false\"}
```

**556. assistant (2026-06-20T14:40:19.429Z)**

**\*\*Works correctly\*\*** ? deselecting Rally 6 updated the footer to **\*\*5 rallies selected · 0:53 total\*\*** and flipped its state (the earlier no-op was a preview click-dispatch quirk, not the code). Screenshot for proof:

**557. assistant (2026-06-20T14:40:34.275Z)**

P2 verified end-to-end ? the grid renders with honest fields (shot chips only where present, e.g. Rally 4 has none), Rally 6 deselected, and the sticky footer reads **\*\*5 rallies · 0:53 · Build reel (5)\*\***. Stopping preview and shipping P2:

**558. user (2026-06-20T14:40:34.780Z)**

Server 6597ccab-fec0-4498-a023-bdb8d426c2e8 stopped

**559. user (2026-06-20T14:40:43.690Z)**

#### 570. user (2026-06-20T14:44:23.503Z)

File created successfully at: C:\Users\avidu\Projects\khelsutra\site\public\own-model.html (file state is current in your context ? no need to Read it back)

#### 571. assistant (2026-06-20T14:44:54.837Z)

Now wire it in: `/own-model` alias on the Node host + cross-links in the landing nav/footer:

#### 572. user (2026-06-20T14:44:57.132Z)

The file C:\Users\avidu\Projects\khelsutra\site\server.js has been updated successfully. (file state is current in your context ? no need to Read it back)

#### 573. user (2026-06-20T14:44:59.014Z)

The file C:\Users\avidu\Projects\khelsutra\site\public\index.html has been updated successfully. (file state is current in your context ? no need to Read it back)

#### 574. user (2026-06-20T14:45:03.654Z)

The file C:\Users\avidu\Projects\khelsutra\site\public\index.html has been updated successfully. (file state is current in your context ? no need to Read it back)

#### 575. assistant (2026-06-20T14:45:21.212Z)

Now the tests ? guard the own-model page content + the cross-link + the `/own-model` route on the Node host:

#### 576. user (2026-06-20T14:45:25.935Z)

The file C:\Users\avidu\Projects\khelsutra\site\src\assets.test.js has been updated successfully. (file state is current in your context ? no need to Read it back)

#### 577. user (2026-06-20T14:45:34.706Z)

The file C:\Users\avidu\Projects\khelsutra\site\src\server.test.js has been updated successfully. (file state is current in your context ? no need to Read it back)

#### 578. assistant (2026-06-20T14:45:45.256Z)

Run the tests, then preview the page:

#### 579. user (2026-06-20T14:45:48.706Z)

```

? the own-model page exists, is honestly scoped, and is linked from the landing page
(0.9145ms)
? handleRequest notifies on a valid submission; a notify failure never breaks it
(1.0498ms)
? [VM host] serves /own-model (3.382ms)
? tests 32
? pass 32
? fail 0

```

#### 580. assistant (2026-06-20T14:45:55.353Z)

32/32 green. Preview the page on the Node host (which exercises the `/own-model` alias):

31be7ea feat(site): own-model page ? annotate your footage & train your own model (annotate-train P1-P4)

**593. assistant (2026-06-20T14:47:56.456Z)**

I committed onto local `master` directly ? I should have branched first. It's only local (not pushed), so let me cleanly move it onto a branch and restore master:

**594. user (2026-06-20T14:48:00.397Z)**

```
--- save commit onto a branch ---
--- reset local master back to origin/master ---
HEAD is now at 62598e7 feat(web): per-rally MVP P2 ? selectable rally grid + selection hook
(unit-tested) (#21)
--- switch to the branch ---
Switched to branch 'feat/own-model-page'
--- verify: branch + only my commit ahead of origin/master ---
feat/own-model-page
31be7ea feat(site): own-model page ? annotate your footage & train your own model (annotate-
train P1-P4)
```

**595. assistant (2026-06-20T14:48:07.412Z)**

Clean recovery ? master restored to `origin/master`, my commit now on `feat/own-model-page`. Pushing + PR:

**596. user (2026-06-20T14:48:20.800Z)**

b1110e1 feat(site): own-model page ? annotate your footage & train your own model (annotate-
train P1-P4) (#22)
```

**598. assistant (2026-06-20T14:49:11.165Z)**

#22 merged (CF deploying). Re-syncing the droplet twin (LF-safe) and verifying `/own-model` on both hosts + parity:

**599. user (2026-06-20T14:49:24.672Z)**

```
service: active
droplet /own-model: 200 own-model md5: 7948cc0c550de4394ba73458e05ed173
=== wait for CF #22, then compare /own-model + run parity ===
CF /own-model live; cf-md5: 7948cc0c550de4394ba73458e05ed173
OK / a212b2d39eff770afb4025cefa592247
OK /capture 2ada2cfccf855c0d6b31d7bb818e9f29
PARITY: in sync
```

**600. assistant (2026-06-20T14:49:53.104Z)**

**\*\*Both hosts in sync, `/own-model` live on both\*\*** ? droplet md5 `7948cc0c` == Cloudflare md5 `7948cc0c`, and `PARITY: in sync` (`/` + `/capture`). Let me record the checkpoint.

**601. user (2026-06-20T14:49:54.904Z)**

17:[Omitted long matching line]  
18:[Omitted long matching line]

**602. assistant (2026-06-20T14:50:13.435Z)**

Both confirmed on the handoff bullet. Updating P2 done, own-model live, and the org-transfer status:

**603. user (2026-06-20T14:50:16.933Z)**

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md has been updated successfully. (file state is current in your context ? no need to Read it back)

**604. user (2026-06-20T14:50:28.189Z)**

<tool\_use\_error>String to replace not found in file.  
String: awaiting owner OK to BUILD (`own-model.html`, annotate-train P1).</tool\_use\_error>

**605. assistant (2026-06-20T14:50:37.501Z)**

Let me get the exact text:

**606. user (2026-06-20T14:50:39.267Z)**

18:OK to BUILD

**607. user (2026-06-20T14:50:46.687Z)**

18:wn-model` setup guide; **\*\*awaiting owner OK to BUILD\*\*** (`own-model.html`, annotate

**608. user (2026-06-20T14:50:59.829Z)**

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md has been updated successfully. (file state is current in your context ? no need to Read it back)

**609. assistant (2026-06-20T14:51:17.107Z)**

All three done.

**1?? rally-annotator ? `Khelsutra` org ? \*\*yes, it can be moved\*\***

Verified: you're an **owner/admin** of the `Khelsutra` org and there's **no name conflict**. A transfer keeps issues/PRs/stars/Actions and **auto-redirects** the old URL (so the site link keeps working). "Giving up ownership" just means the org owns it ? you stay an org owner. **Say "go" and I'll run it** (`gh api repos/avidullu/rally-annotator/transfer -f new\_owner=Khelsutra`) and update the `own-model.html` + doc links to `Khelsutra/rally-annotator` ? or you can click it in repo Settings.

### **2?? Per-rally MVP **P2** ? [khelsutra#21](https://github.com/avidullu/khelsutra/pull/21) (merged)**

The selectable **RallyGrid** + **useRallySelection** hook (pure `selection.ts`/`format.ts`, default all-selected per D8). **Honest fields only** ? ordinal, mm:ss start, duration, shot-count chip **only when present** (never `server`/`receiver`/`events`). Sticky footer with running count + total + a Build button (wires to compile in P5). **16 vtest green**; live-verified ? deselecting a rally recomputed the footer 6/1:22 ? 5/0:53. (Next: P3 `parseQuery`.)

### **3?? **own-model page** ? [khelsutra#22](https://github.com/avidullu/khelsutra/pull/22) (merged, live on both**

`site/public/own-model.html` (`/own-model`, linked from the nav + footer) ? three honest sections:

- **Annotate** **(live today)** ? the free MIT VLC `rally-annotator` + install + flow + GitHub link.
- **Train your own model** **(open pipeline . in build)** ? the ownership/licensing/privacy **moat**, with a "Read this honestly" fence (CLI today, GPU-gated, **no "Train now" button**, no accuracy claim).
- **Setup & use** ? VLC install paths, the verbatim CSV format + ending-reason enum, the `worker train` commands.

`noindex`; **screenshot placeholders only** (no fabricated images ? real captures are the owner-gated P5). Suite **30 ? 32 green**; **deployed to Cloudflare + the droplet twin**, and parity is green (`/own-model` md5 identical on both; `OK / `, `OK /capture`).

master `b1110e1`, no open PRs. (One process note: I briefly committed own-model onto local `master`, caught it, and cleanly moved it to a branch before pushing ? nothing reached the remote default branch.)

**Next, your pick:** the **org transfer** (just say go), per-rally **P3** (`parseQuery` query bar), or the **owner-gated screenshots** for the own-model page (send me consented, no-minors stills and I'll drop them in).

#### **610. user (2026-06-20T14:51:19.943Z)**

Please complete that transfer and link it to the web page cleanly thanks a lot!

#### **611. assistant (2026-06-20T14:51:59.798Z)**

On it ? completing the transfer now. First the exact org login casing, then the transfer:

#### **612. user (2026-06-20T14:52:03.517Z)**

```
=== canonical org login ===
Khelsutra
=== TRANSFER rally-annotator -> Khelsutra ===
{"full_name":"avidullu/rally-annotator","name":"rally-annotator","owner":"avidullu"}
```

#### **613. assistant (2026-06-20T14:52:14.859Z)**

Transfer accepted (GitHub processes it asynchronously ? the response still shows the old owner). Let me confirm the new path resolves:

#### **614. user (2026-06-20T14:52:21.530Z)**

```
TRANSFER COMPLETE after ~0s -> Khelsutra/rally-annotator
--- new repo facts ---
{"full_name":"Khelsutra/rally-annotator","private":false,"visibility":"public"}
--- old path redirects? ---
```

Khelsutra/rally-annotator

**615. assistant (2026-06-20T14:52:31.521Z)**

**\*\*Transfer complete\*\*** ? `Khelsutra/rally-annotator` is live (public), and the old `avidullu/rally-annotator` path redirects to it. Now update the links cleanly. Let me branch and find every reference:

**616. user (2026-06-20T14:52:36.228Z)**

branch 'chore/annotator-org-links' set up to track 'origin/master'.  
Switched to a new branch 'chore/annotator-org-links'  
chore/annotator-org-links

```

#### 630. assistant (2026-06-20T14:55:22.624Z)

? \*\*Transfer complete and linked cleanly, live on both hosts:\*\*

- `Khelsutra/rally-annotator` is the new home (public); the old `avidullu/?` URL auto-redirects.
- The own-model page's GitHub button + footer now point to `github.com/Khelsutra/rally-annotator` (2 refs on the droplet, **0** old refs); confirmed live on Cloudflare too.
- `/own-model` is **byte-identical** on both hosts (md5 `c0af70fb`), and `PARITY: in sync`.

Let me update the checkpoint:

### 631. user (2026-06-20T14:55:26.853Z)

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md has been updated successfully. (file state is current in your context ? no need to Read it back)

### 632. assistant (2026-06-20T14:55:43.786Z)

All done ? the transfer is complete and the web page links to the org cleanly.

## ? Transfer

- **`avidullu/rally-annotator`** ? **`Khelsutra/rally-annotator`** (the org owns it now; it stayed public; the old URL auto-redirects, so nothing breaks).

## ? Links repointed ? [khelsutra#23](https://github.com/avidullu/khelsutra/pull/23) (merged)

- The own-model page's **GitHub button + footer** now point to `github.com/Khelsutra/rally-annotator`; the `ANNOTATE_AND_TRAIN.md` references and the test guard updated too.
- **Deployed to both hosts**, verified live: Cloudflare + the droplet twin both serve the Khelsutra link, **0** old references, `/own-model` byte-identical (md5 `c0af70fb`), and `PARITY: in sync`. Suite 32 green.

master `87520b8`, no open PRs.

One tidy-up worth doing (optional): your **local** `rally-annotator` checkout (C:\Users\avidu\Projects\rally-annotator) still has its `git remote` pointed at the old URL ? it keeps working via redirect, but the clean fix is `git remote set-url origin https://github.com/Khelsutra/rally-annotator.git`. Want me to run that in the sibling repo?

Otherwise, next up whenever you like: **per-rally P3** (the `parseQuery()` query bar), or send me consented/no-minors stills and I'll swap the own-model **screenshot placeholders** for the real thing.

### 633. user (2026-06-20T14:55:46.706Z)

we now have a video on the website which we show a clip of when someone signs up, can we not reuse that for the screenshots?

### 634. assistant (2026-06-20T14:57:41.030Z)

Good question ? and it's worth being precise, because the video and the placeholder are actually two different things:

**The video is a highlight \*reel\*** (the engine's output ? badminton play), not a screenshot of the **rally-annotator tool**. The own-model page's placeholder is for "the Rally Annotator dialog open over a match in VLC" ? i.e., the labeling UI (the Mark START/END buttons, the dialog, the CSV). The reel doesn't show any of that, so it can't stand in for the tool screenshot. A genuine "here's how you annotate" visual still needs a capture of VLC + the plugin (which only you can grab on your machine).

**But yes ? we can reuse a real still from the video as an honest illustrative visual.** A frame of the actual session (e.g. the YouTube thumbnail) legitimately shows "the kind of footage you record and annotate / the reel KhelSutra makes," and it's already consented content. That would replace the bare text placeholder with something real ? no new capture needed.

**One thing to weigh first:** putting that still **openly** on the own-model page shows the two players' likeness ? which is exactly what we just **gated behind sign-up** on the landing page.

The own-model page is a secondary, `noindex` page (much lower exposure than the homepage hero), but it's the same people, so it's your call.

So, which way do you want it?

#### 635. user (2026-06-20T14:57:59.004Z)

Your questions have been answered: "How should I handle visuals on the own-model page, given the video is a reel (not a shot of the annotation tool)?"="Embed the gated reel here too". You can now continue with these answers in mind.

#### 636. assistant (2026-06-20T14:59:45.176Z)

On it ? embedding the reel as a **click-to-play** on the own-model page (branded poster, so the footage/players aren't shown until a click), consistent with the homepage. This is a small, focused page+test edit, so I'll do it directly. Let me branch and locate the exact anchors:

#### 640. assistant (2026-06-20T15:00:31.853Z)

All anchors found. Making the edits ? CSS, the click-to-play reel block (branded poster), removing the tool placeholder, and the script:

#### 641. user (2026-06-20T15:00:37.641Z)

The file C:\Users\avidu\Projects\khelsutra\site\public\own-model.html has been updated successfully. (file state is current in your context ? no need to Read it back)

#### 642. user (2026-06-20T15:00:40.376Z)

The file C:\Users\avidu\Projects\khelsutra\site\public\own-model.html has been updated successfully. (file state is current in your context ? no need to Read it back)

#### 643. user (2026-06-20T15:00:42.015Z)

The file C:\Users\avidu\Projects\khelsutra\site\public\own-model.html has been updated successfully. (file state is current in your context ? no need to Read it back)

#### 644. assistant (2026-06-20T15:00:46.669Z)

Now the click-to-play script:

#### 645. user (2026-06-20T15:00:53.242Z)

The file C:\Users\avidu\Projects\khelsutra\site\public\own-model.html has been updated successfully. (file state is current in your context ? no need to Read it back)

#### 646. assistant (2026-06-20T15:01:02.924Z)

Now update the test to encode the privacy intent (click-to-play, no autoloading iframe, no open thumbnail). Let me read the current own-model test:

#### 647. user (2026-06-20T15:01:03.746Z)

```
53 const cap = read("capture.html");
54 assert.match(cap, /<html/i, "capture.html is not HTML");
55 assert.match(cap, /capture checklist/i, "capture.html lost its checklist content");
56 });
57
58 test("the 'How do I join?' FAQ points at the request-access form, not email", () => {
59 const html = read("index.html");
60 const m = html.match(/How do I join\?<\summary>(<p>[\s\S]*?<\p>)/);
61 assert.ok(m, "the 'How do I join?' FAQ is gone");
62 assert.match(m[1], /request access/i, "the join FAQ should send people to the request-
access form");
```

```

63 assert.match(m[1], /href="#join"/, "the join FAQ should link to the #join form");
64 assert.doesNotMatch(m[1], /mailto/, "the join FAQ should NOT tell people to email (use
the form)");
65 });
66

```

#### 648. user (2026-06-20T15:01:13.727Z)

```

66
67 test("the own-model page exists, is honestly scoped, and is linked from the landing
page", () => {
68 const om = read("own-model.html");
69 assert.ok(om.length > 0, "own-model.html is missing or empty");
70 for (const id of ["annotate", "train", "setup"]) {
71 assert.match(om, new RegExp(`id="${id}"`), `own-model is missing the #${id}
section`);
72 }
73 assert.match(om, /github\.com\/Khelsutra\/rally-annotator/, "the GitHub link to the
annotator is gone");
74 assert.match(om, /Read this honestly/i, "the honest framing fence is gone");
75 assert.match(om, /open pipeline|in build/i, "training must be honestly scoped as in-
build, not one-click");
76 assert.match(om, /name="robots" content="noindex"/, "own-model should be noindex");
77 assert.doesNotMatch(om, /<img\b/i, "no fabricated screenshot ? use placeholders
until real captures exist");
78 assert.match(read("index.html"), /href="\own-model"/, "the landing page should link
to /own-model");
79 });
80

```

#### 649. user (2026-06-20T15:01:25.965Z)

The file C:\Users\avidu\Projects\khelsutra\site\src\assets.test.js has been updated successfully. (file state is current in your context ? no need to Read it back)

#### 650. assistant (2026-06-20T15:01:31.390Z)

Now verify ? run the tests, then drive the click-to-play on the page:

#### 651. user (2026-06-20T15:01:34.842Z)

```

? the own-model page exists, is honestly scoped, and is linked from the landing page
(0.8941ms)
? handleRequest notifies on a valid submission; a notify failure never breaks it
(0.9277ms)
? [VM host] serves /own-model (2.4533ms)
? tests 32
? pass 32
? fail 0

```

#### 652. assistant (2026-06-20T15:01:45.682Z)

32/32 green. Preview the page on the Node host ? confirm the branded poster (no footage shown) before click:

#### 653. user (2026-06-20T15:01:48.910Z)

```

{
 "serverId": "09f7a2c3-c0a7-4471-9358-8cbbb7618114",

#### 667. assistant (2026-06-20T15:04:39.997Z)

? **\*\*Reel reused on the own-model page, live on both hosts:\*\*** droplet shows `facade=4`, **\*\*static-iframe=0\*\***, **\*\*thumbnail=0\*\*** (footage hidden until tap); Cloudflare facade live; `PARITY: in sync`; `/own-model` byte-identical (md5 `90de6a9e`). Let me update the checkpoint.

#### 668. user (2026-06-20T15:04:44.960Z)

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md has been updated successfully. (file state is current in your context ? no need to Read it back)

#### 669. assistant (2026-06-20T15:05:00.097Z)

Done ? the reel is now reused on the own-model page, exactly as you wanted, live on both hosts.

#### ? [khelsutra#24](<https://github.com/avidullu/khelsutra/pull/24>) (merged, live + parity green)

**\*\*The honest distinction first:\*\*** the video is a highlight **\*\*reel\*\*** (the engine's output), not a screenshot of the annotation **\*\*tool\*\*** ? so it can't fill a "how to annotate" screenshot. But it's a great real visual, so I embedded it as **\*\*click-to-play\*\***, consistent with the homepage:

- A **\*\*branded poster\*\*** (ink gradient + play button, **\*\*no footage or faces\*\***) ? on **\*\*tap\*\***, loads the `youtube-nocookie` player and **\*\*seeks to a random point 90s before the end\*\*** (same mechanism as the homepage, so it's not the same chunk each time).

- **\*\*Footage stays hidden until the tap\*\*** ? verified live on both hosts: `static-iframe=0`, `thumbnail=0`, only the branded poster shows. After tap, the nocookie player autoplays from a random point.

- Replaced the lone text placeholder; the GitHub button reads `Khelsutra/rally-annotator`.

- Tests guard it (click-to-play + nocookie + random-start, and **\*\*no\*\*** open iframe/thumbnail/fabricated img). Suite **\*\*32 green\*\***. Cloudflare + droplet **\*\*byte-in-sync\*\*** (`/own-model` md5 `90de6a9e`).

**\*\*Net:\*\*** you no longer need separate stills just to give the page a real visual ? it reuses your reel safely. The only thing the reel *\*can't\** show is the annotator UI itself (the VLC dialog / CSV); if you ever want that "how to annotate" walkthrough, it'd need a quick screen capture of the plugin in action ? entirely optional.

master `f09e348`, no open PRs. Next whenever you like: per-rally **\*\*P3\*\*** (the `parseQuery()` query bar), or anything else.

#### 670. user (2026-06-20T15:05:02.733Z)

You can use these two for the VLC plugin screenshots

Make sure to have the same mechanism of playing only 60-90s of a randomly started clip similar to how its shown after access form completion

Make sure to highlight that a default is available (the one we train and deploy) but also mention that one can use their own videos to train as well. Ensuring that a default is available keeps the non tech savvy folks engaged

#### 671. assistant (2026-06-20T15:07:00.847Z)

Those are exactly the tool screenshots the page needed ? the annotation dialog + the VLC enable-menu. One practical issue: pasted-in-chat images don't come to me as files I can commit, so let me first check whether the harness saved them to disk anywhere I can reach:

#### 675. assistant (2026-06-20T15:09:35.454Z)

Got the files ? and good news on consent: **\*\*both screenshots are pure tool UI with no footage/people\*\*** (the dialog over a blank "no video" player; the VLC View menu over the cone logo). That actually makes your new idea cleaner.

**\*\*My thoughts:** yes, that's more coherent ? let's do it.\*\* Here's the reasoning:

- The **\*\*reel** has the players in it\*\* ? it belongs in *\*one\** gated place (request-access), not scattered. Showing it (even click-to-play) on the own-model page slightly undercut that.
- The **\*\*own-model** page is about the *\*tool\*\*\** ? the right visuals there are the **\*\*annotation screenshots\*\*** (which show no people). So: own-model = tool screenshots + **\*\*"request access to see a sample output"**, and the reel stays behind sign-up everywhere. Clean and consistent.

Let me implement: branch, bring in the screenshots, swap the reel embed for a request-access

pointer + the two tool shots, and fold in the "a default is ready ? BYO-training is optional" framing.

#### 676. user (2026-06-20T15:09:39.183Z)

```
branch 'feat/own-model-tool-shots' set up to track 'origin/master'.

208 </script>
209 </body>
210 </html>
211

```

**679. assistant (2026-06-20T15:11:09.131Z)**

Got the full picture. Implementing the coherent layout ? swap the reel embed for a "request access to see a sample" pointer, add the two tool screenshots to the Annotate section, add the "default works out of the box; BYO-training optional" framing, and drop the reel script:

**680. user (2026-06-20T15:11:16.120Z)**

The file C:\Users\avidu\Projects\khelsutra\site\public\own-model.html has been updated successfully. (file state is current in your context ? no need to Read it back)

**681. user (2026-06-20T15:11:27.202Z)**

The file C:\Users\avidu\Projects\khelsutra\site\public\own-model.html has been updated successfully. (file state is current in your context ? no need to Read it back)

**682. user (2026-06-20T15:11:36.141Z)**

The file C:\Users\avidu\Projects\khelsutra\site\public\own-model.html has been updated successfully. (file state is current in your context ? no need to Read it back)

**683. user (2026-06-20T15:12:21.338Z)**

The file C:\Users\avidu\Projects\khelsutra\site\public\own-model.html has been updated successfully. (file state is current in your context ? no need to Read it back)

**684. user (2026-06-20T15:12:33.425Z)**

The file C:\Users\avidu\Projects\khelsutra\site\public\own-model.html has been updated successfully. (file state is current in your context ? no need to Read it back)

**685. assistant (2026-06-20T15:12:45.288Z)**

Now rewrite the own-model test (reel removed, real screenshots added). Reading it:

**686. user (2026-06-20T15:12:46.295Z)**

```
67 test("the own-model page exists, is honestly scoped, and is linked from the landing
page", () => {
68 const om = read("own-model.html");
69 assert.ok(om.length > 0, "own-model.html is missing or empty");
70 for (const id of ["annotate", "train", "setup"]) {
71 assert.match(om, new RegExp(`id="${id}"`), `own-model is missing the #${id}
section`);
72 }
73 assert.match(om, /github\.com\/Khelsutra\/rally-annotator/, "the GitHub link to the
annotator is gone");
74 assert.match(om, /Read this honestly/i, "the honest framing fence is gone");
75 assert.match(om, /open pipeline|in build/i, "training must be honestly scoped as in-
build, not one-click");
76 assert.match(om, /name="robots" content="noindex"/, "own-model should be noindex");
77 assert.doesNotMatch(om, /<img\b/i, "no fabricated screenshot ? use
placeholders/real captures only");
78 assert.match(read("index.html"), /href="\own-model"/, "the landing page should link
to /own-model");
79 // the sample reel is reused here as a CLICK-TO-PLAY embed (privacy-consistent with
the homepage):
80 assert.match(om, /id="om-reel-play"/, "the click-to-play reel facade is gone");
81 assert.match(om, /youtube-nocookie\.com/, "reel must use the privacy nocookie host");
82 assert.match(om, /ajTCZ7pJW_o/, "the reel video id is gone");
83 assert.match(om, /getDuration\(\)/, "reel should start at a random point (derived from
duration)");
84 // footage must NOT be visible until a tap: no autoloading iframe, no open video
thumbnail of the players
```

```
85 assert.doesNotMatch(om, /<iframe/i, "the reel must load on click, not be an autoloading
iframe");
86 assert.doesNotMatch(om, /i\.yimg\.com/, "don't show the video thumbnail (players)
openly ? use a branded poster");
87 });
88
```

#### 687. user (2026-06-20T15:13:02.077Z)

The file C:\Users\avidu\Projects\khelsutra\site\src\assets.test.js has been updated successfully. (file state is current in your context ? no need to Read it back)

#### 688. assistant (2026-06-20T15:13:07.822Z)

Now verify ? tests, then preview the new layout:

#### 689. user (2026-06-20T15:13:10.286Z)

```
? the own-model page exists, is honestly scoped, and is linked from the landing page
(1.4642ms)
? handleRequest notifies on a valid submission; a notify failure never breaks it
(0.884ms)
? [VM host] serves /own-model (2.011ms)
? tests 32
? pass 32
? fail 0
```

#### 690. assistant (2026-06-20T15:13:17.511Z)

32/32 green. Preview the new layout on the Node host:

#### 691. user (2026-06-20T15:13:20.859Z)

```
{
 "serverId": "46d5ae5e-f25b-44b8-8f87-8f40635f69b9",
 "port": 8080,
 "name": "khelsutra-node",
 "reused": false
}
Server started successfully on port 8080.
```

#### 692. user (2026-06-20T15:13:27.784Z)

"go"

#### 693. user (2026-06-20T15:13:34.816Z)

```
"{"shotCount":2,"imgsLoaded":[{"src":"/img/annotate-
enable.png","ok":false},{"src":"/img/annotate-
tool.png","ok":false}], "hasReel":false,"sampleCallout":true,"defaultFraming":true}"
```

#### 694. assistant (2026-06-20T15:13:50.888Z)

Good signals ? 2 screenshots present, \*\*no reel\*\* (`hasReel:false`), sample callout + default framing present. The images show `ok:false` only because they're `loading="lazy"` and below the fold. Let me scroll them into view and confirm they actually load:

#### 695. user (2026-06-20T15:13:51.545Z)

"scrolled"

#### 696. user (2026-06-20T15:13:56.822Z)

```
"[{\"src\":\"/img/annotate-enable.png\", \"ok\":false, \"w\":0}, {\"src\":\"/img/annotate-tool.png\", \"ok\":false, \"w\":0}]"
```

**697. assistant (2026-06-20T15:14:17.512Z)**

Let me check the network status of the image requests + screenshot to see if they render:

**698. user (2026-06-20T15:14:18.223Z)**

```
[29792.26] POST https://cloudflareinsights.com/cdn-cgi/rum [FAILED: net::ERR_FAILED]

```

**699. assistant (2026-06-20T15:14:38.825Z)**

No image request fired ? that's `loading="lazy"` not triggering in the headless preview (not a 404). Let me confirm the server actually serves them with a direct request:

**700. user (2026-06-20T15:14:40.554Z)**

```
/img/annotate-enable.png -> HTTP 200 image/png 133712b
/img/annotate-tool.png -> HTTP 200 image/png 153133b
```

**701. assistant (2026-06-20T15:14:59.145Z)**

Both images serve **HTTP 200 image/png** ? the `ok:false` was just lazy-load not firing headlessly. Let me force them to load and screenshot the layout:

**702. user (2026-06-20T15:15:01.444Z)**

"forced"

**703. user (2026-06-20T15:15:37.680Z)**

preview\_screenshot timed out after 30s. The preview window may be stuck (modal dialog, navigation hang, or unresponsive renderer). Check preview\_console\_logs for errors.

**704. assistant (2026-06-20T15:15:45.604Z)**

Screenshot timed out (transient renderer hang). Let me retry once:

**705. user (2026-06-20T15:16:16.000Z)**

preview\_screenshot timed out after 30s. The preview window may be stuck (modal dialog, navigation hang, or unresponsive renderer). Check preview\_console\_logs for errors.

**706. assistant (2026-06-20T15:16:29.709Z)**

Two screenshot timeouts (stuck renderer) ? but verification is already solid without the visual: **32 tests green**, both images serve **HTTP 200 image/png**, and the eval confirmed the structure (2 screenshots, **no reel**, sample?request-access callout, "out of the box" default framing). Let me stop the preview and ship:

**707. user (2026-06-20T15:16:30.214Z)**

Server 46d5ae5e-f25b-44b8-8f87-8f40635f69b9 stopped

#### 708. user (2026-06-20T15:16:42.217Z)

1906c82 feat(site): own-model ? gate the reel, show the real annotator screenshots + a "default
works" note (#25)
```

#### 713. assistant (2026-06-20T15:18:02.637Z)

Merged (`1906c82`, images as binary). Re-syncing the droplet (incl. the images) and verifying

binary integrity + layout on both hosts:

**714. user (2026-06-20T15:18:22.975Z)**

```
droplet own-model: shots=2 reel-iframe(0)=0 youtube(0)=0
droplet img: enable=200 tool=200 tool-md5=b6350339f5d472dbb6de98bceead4e88
local tool-md5: b6350339f5d472dbb6de98bceead4e88
=== wait for CF, then parity + CF img check ===
CF own-model screenshots LIVE
CF img: tool=000 tool-md5=b6350339f5d472dbb6de98bceead4e88
OK / a212b2d39eff770afb4025cefa592247
OK /capture 2ada2cfccf855c0d6b31d7bb818e9f29
PARITY: in sync
```

**715. assistant (2026-06-20T15:18:41.213Z)**

Binary integrity confirmed everywhere ? droplet + Cloudflare + local all md5 `b6350339?` (images survived git-archive?tar intact). Droplet own-model: 2 screenshots, \*\*0 iframe, 0 youtube\*\* (reel gone); parity green. The CF `000` on the first curl was a transient blip (the md5 fetch on the very next call succeeded). Quick re-check to be clean:

**716. user (2026-06-20T15:18:46.222Z)**

```
CF img tool: HTTP 000
CF img enable: HTTP 000
CF own-model: reel-iframe(0)=0 default-note=1
```

**717. assistant (2026-06-20T15:19:11.001Z)**

The HTTP `000` is Git Bash curl flaking on the larger HTTPS binary (the md5 fetch \*did\* return the correct bytes moments ago). Let me confirm via PowerShell's HTTP stack, which is reliable on Windows:

**718. user (2026-06-20T15:19:16.276Z)**

```
https://khelsutra.guru/img/annotate-tool.png -> HTTP 200 image/png 153133b
https://khelsutra.guru/img/annotate-enable.png -> HTTP 200 image/png 133712b
```

**719. assistant (2026-06-20T15:19:35.255Z)**

**\*\*Confirmed via PowerShell: both Cloudflare images serve HTTP 200 image/png at exact byte sizes\*\*** (153133b + 133712b). The earlier `000` was Git Bash curl flaking on Windows HTTPS ? Cloudflare is serving them fine. Let me update the checkpoint.

**720. user (2026-06-20T15:19:37.374Z)**

```
18:own-model reel REUSED
18:remain an optional future capture
```

**721. user (2026-06-20T15:19:55.944Z)**

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md has been updated successfully. (file state is current in your context ? no need to Read it back)

**722. assistant (2026-06-20T15:20:10.752Z)**

Done ? your more coherent layout is live on both hosts. ?  
[khelsutra#25](https://github.com/avidullu/khelsutra/pull/25) (merged)

**\*\*Your instinct was right ? it's cleaner this way:\*\*** one gated home for the reel (which has the players), and the own-model page now shows the \*tool\*.

- **Reel embed removed** from the own-model page ? replaced with a one-line pointer: `"Want to see what KhelSutra produces? A real sample reel plays the moment you request access."` The reel stays gated behind sign-up in one place (footage never shown openly here ? verified ``iframe=0`, `youtube=0``).
- **Your two screenshots are in** (and they're ideal ? pure tool UI, no people): ``annotate-enable.png`` (VLC ? View ? Rally Annotator) and ``annotate-tool.png`` (the Mark START/END/Save dialog), with captions + alt text in the Annotate section.
- **Default-works framing added** to the Train section: `"You don't have to train anything ? KhelSutra runs on a ready-made default, out of the box; training your own is optional."` ? so non-tech folks aren't scared off, while BYO-training stays the power-user moat.

**Verified everywhere:** 32 tests green; both images serve **HTTP 200 image/png** on the droplet \*and\* Cloudflare, md5 ``b6350339`` identical to local (binary survived the git-archive?tar sync intact); ``PARITY: in sync`. master `1906c82`, no open PRs.`

(One aside: I dropped the click-to-play reel I'd added to this page yesterday ? net, the reel now exists in exactly one gated spot, which is the whole point.)

Next whenever you like: per-rally **P3** (the ``parseQuery()`` query bar), or anything else.

### 723. user (2026-06-20T15:20:12.531Z)

perfect. please make these changes, merge the PRs and push to both the serving points (cloudflare and droplet) and handover for the next session  
BTW once the person comes in own model then the top navigation bar goes away and coming back to the product bage requires brower back button, can we do something there? or thats good that way?  
BTW also add an item to see if moving the badminton highlight indexer and sports data collector etc. sister repos to khelsutra as private repo is possible and would I retain the access to keep developing while being able to add some contributor if someone is excited

### 724. assistant (2026-06-20T15:23:18.719Z)

All clear on #25 ? already merged + on both hosts. Let me answer your two questions and ship the nav fix + handover.

First, a quick check on the org's private-repo capability (to ground the sister-repos answer) and cut a branch for the nav fix:

### 725. user (2026-06-20T15:23:25.213Z)

```
=== Khelsutra org capabilities ===
{"default_repo_perm":"read","members_can_create_private":true,"plan":"free","private_repos_allowed":10000,"total_private":0}
=== branch ===
branch 'feat/own-model-backlink' set up to track 'origin/master'.
Switched to a new branch 'feat/own-model-backlink'
feat/own-model-backlink
```

### 726. assistant (2026-06-20T15:23:52.299Z)

Org check confirms it: **free org, 10000 private repos allowed, can add private repos + collaborators** ? so moving the sister repos in (private) is feasible and you keep full access (more in the handover). Now the nav fix:

### 727. user (2026-06-20T15:23:54.692Z)

The file `C:\Users\avidu\Projects\khelsutra\site\public\own-model.html` has been updated successfully. (file state is current in your context ? no need to Read it back)

### 728. user (2026-06-20T15:23:55.172Z)

```
36
37 ## Bigger arcs (design-first)
38 - Single-box appliance (KhelSutra Studio) ? Tracked design:
```

```

`docs/LOCAL_APPLIANCE_ARCHITECTURE.md` (DRAFT, owner-gated).**
39 The `web/` SPA drives the full **ingest (Drive / bucket URI / local upload) ? index ?
pick rallies ? reel ? download**
40 loop on ONE box, behind an **edge auth gate** (engine stays `127.0.0.1`, CORS `` is
moot). It is the single-box
41 profile of the engine's decoupled `StorageBackend` + `backend.worker` architecture.
MVP runs on the CPU droplet via
42 **Gemini/stub** ; **real local-GPU detection needs a GPU host** (DO droplet / GCE VM /
Cloud Run+GPU ? owner priority
43 ASAP, runs parallel to the UI MVP). Per-rally selection = one screen. Owner decisions
pending in §10 (edge auth,
44 retention, cost ceiling, GPU host, P5 bridge).
45 - **Alpha SPA** in `web/` (Vite + React + TS + Tailwind) ? hosts the operator console +
the per-rally selection UI above.
46 - **BYO-storage + autosync** ? connect Drive/OneDrive/GCS/S3, watch the folder, auto-
prepare reels
47 (engine `PLATFORM_ARCHITECTURE.md §3`). The form's GPU/storage answers are the demand
signal.
48 - **Control plane** (`control-plane/`) at beta.
49

```

### 729. assistant (2026-06-20T15:24:13.014Z)

Now the org-move backlog item in NEXT\_STEPS and the test guard for the back-link:

### 730. user (2026-06-20T15:24:20.659Z)

The file C:\Users\avidu\Projects\khelsutra\NEXT\_STEPS.md has been updated successfully. (file state is current in your context ? no need to Read it back)

### 731. user (2026-06-20T15:24:20.801Z)

The file C:\Users\avidu\Projects\khelsutra\site\src\assets.test.js has been updated successfully. (file state is current in your context ? no need to Read it back)

### 732. assistant (2026-06-20T15:24:30.499Z)

Run the tests, then ship:

### 733. user (2026-06-20T15:24:33.771Z)

```

? the own-model page exists, is honestly scoped, and is linked from the landing page
(1.6341ms)
? handleRequest notifies on a valid submission; a notify failure never breaks it
(0.7856ms)
? [VM host] serves /own-model (2.434ms)
? tests 32
? pass 32
? fail 0

```

### 734. assistant (2026-06-20T15:24:39.483Z)

32/32 green. Committing + PR:

### 735. user (2026-06-20T15:24:48.079Z)

```

### 740. assistant (2026-06-20T15:26:42.072Z)

Live on both hosts, parity green (`/own-model` md5 `75066a54` on both). Now the **handover**.  
Let me read the session-handoff doc to refresh it:

10 # Session handoff ? sports highlight indexer (repo still named badminton-highlight-
indexer; RENAME PENDING) + siblings: sports-data-collector, rally-annotator, sports-obsreport
11
12 **Last updated:** 2026-06-16 (master ?#183; admin-merged on local-green throughout the
GitHub-billing CI outage).
13 ***? FRESHEST CONTEXT (overnight 2026-06-15?16 ? read [[current-state]] top
checkpoints):**
14 - **Boxhill 5-reel `--force` regen DONE + verified ALL DEDUP-CLEAN** (the #180 doubled-
rally bug is gone end-to-end).
15 - **WASB streaming fast-path #178 FIXED + MERGED (`c7df281`).** As-shipped it was BROKEN
(shimmed `cv2.imread` but WASB
16 reads via PIL `read_image` + an `osp.exists` guard + needed RGB not BGR). Now patches
`dataloaders.dataset_loader`.
17 read_image` ? PIL RGB; **proven byte-identical** (same-MD5 trajectory CSV, stream vs
PNG path). Opt-in
18 `indexing.wasb.stream_video`. Avoids the ~46k-PNG dump that timed out long 4K clips.
19 - **Fully-local NO-AI segmenter mode MERGED (#183, `b6a39c46`).**
`IndexingConfig.skip_ai_handoff` (default OFF) ? the
20 trajectory hybrids emit WASB candidate windows AS rallies, no Gemini/key/upload
(Fusion still Gate-A/B-filters). Runner
21 flags `--skip-ai-handoff` + `--wasb-stream`; **runner now `load_dotenv()`s** (fixed:
it didn't load .env ? silent
22 zero-rally Gemini runs). This is the local baseline for the owned-model "avoid Gemini"
track.
23 - **Kushagra/Yash June-12 regen DONE + verified.** 6 GoPro 4K originals (`F:\GoPro Hero
Black 12\KhelSutra\Badminton 12
24 June 2026`) ? 1080p NVENC proxies (`F:\KhelSutra_work\kushagra_june12_proxies`) ?
Gemini reels in `G:\?\Kushagra and
25 Yash\June 12 Highlights` (6/6, 165 rallies, ALL DEDUP-CLEAN; `_REGEN_REPORT.md`
there).
26 - **IN FLIGHT:** local-vs-Gemini comparison (Phase C) ? `wasb_hybrid --skip-ai-handoff`
on 3 of those videos ? isolated
27 `output/local_compare.db`; `scratch/compare_local_vs_gemini.py` writes the divergence
report (for the owned-model track).
28 - **PROXY RECIPE (reusable):** 4K GoPro HEVC is 10-bit ? `ffmpeg -hwaccel cuda
-hwaccel_output_format cuda -i SRC -vf
29 scale_cuda=1920:1080:format=nv12 -c:v h264_nvenc -preset p5 -cq 23 -c:a aac` (~4.6x
realtime). Then run the RUNNER on
30 proxies (Gemini downscales chunks to 1280px anyway; stitcher has no downscale so
proxies keep reels 1080p).
31 - Discipline held: FULL `run_all_tests.py` + ruff + mypy green before EVERY merge (CI
red account-wide on billing outage).
32 - HOUSEKEEPING FOR OWNER: **rotate the Gemini key** (owner said they'd rotate in the AM;
only in gitignored `.env`);
33 **top up GitHub Actions billing** to restore CI gating. **The EXECUTION-POLICY track
below is still valid + owner-gated.**
34
35 ***? NEXT MAJOR (owner-gated) PICKUP = EXECUTION-POLICY P3 (then P4)** ? a per-job,
self-scheduling resilience framework
36 (owner's design, validated). **DESIGN
37 ([#132](https://github.com/avidullu/badminton-highlight-indexer/pull/132))
`docs/EXECUTION_POLICY.md`) + P1 the actual
38 Gemini-hang fix ([#133](https://github.com/avidullu/badminton-highlight-
indexer/pull/133))
39 `backend/infrastructure/execution_policy.py` ? `run_bounded`/`poll_until`, 100% module
coverage) + P2 the self-scheduling
40 DB substrate ([#135](https://github.com/avidullu/badminton-highlight-indexer/pull/135)) ?
jobs migration v3 `policy`/`next_poll_at`,
41 `claim_due_job`/`set_job_waiting`) are MERGED.** **NOT DONE (next session, own distinct
PRs, HIGH coverage):** **P3** =

```

```

42 wire the `main.py` executor to a `claim_due_job` self-scheduling loop honoring
WAIT_AND_RESUME (release+reschedule) +
43 **resumable AI handoff** (persist per-window confirmation; resume only unconfirmed ? the
GX010125 reel becomes exhaustive
44 across resumes, no wasted Gemini spend); **P4** = apply the policy to the WSL/WASB GPU
pass + ffmpeg. **Read [[current-state]]
45 FIRST** (the top checkpoint has the full P1/P2 detail + the rationale for stopping at
P2).
46
47 **Earlier this same session (rally-quality / paper track, [[paper-coauthor-aim]]):**
analyzers/reconcilers **framework**
48 doc + a verified **multi-agent literature review** ($13 ? skeleton is standard
TAL/TAS+late-fusion, *cite don't claim*;
49 only the report-first reconciler is a novel combination) ? [#119]; **eval measurement-
honesty helpers C1?C4** (`backend/eval/
50 eval_stats.py`+`score_calibration.py`+`segmentation_metrics.py`) ? [#124] + wired into
`experiment.compare` ? [#129];
51 **FIRST golden A/B experiment** (n=6, offline) ? archived [#128]: **Gate-A (net-
crossings?2) is a measured win (+19% F1,
52 6/6, p=0.031), PROMOTED** [#131]; the window-level **learned variant FIXED** (train-fold
threshold tuning + calibration ?
53 +38% F1, un-zeroed) ? [#130]; **`docs/PER_VIDEO_OUTPUT_LAYOUT.md`** plan [#131];
GX010125_1080p reel re-generated into
54 isolated `output/GX010125_run/` (reused cached 1080p trajectory). Prior tracks still
valid: rally-quality fusion P1?P4
55 (#114?127), UI-alpha, productization, first 4K-GPU E2E. This is the ~1-page orientation.
? **THIS IS THE OWNER'S REAL GPU
56 MACHINE** (torch+CUDA/cv2/WSL/Gemini live).
57
58 ## You are here (2026-06-13) ? ? HARDENED + M0 SCAFFOLDED + MOAT QUANTIFIED + QUALITY-
SWEEP + UI-ALPHA LANDING + 4K-E2E PROVEN
59 -1. **Recent landings since the sweep (mostly OTHER slates ? facts from git/gh, not this
session's work):**
60 - **UI-alpha:** PR-1 async jobs (#87) + **PR-2 chunked upload + highlight download
(#99, live-E2E-verified)** +
61 docs sync (#100). Next UI slice = **PR-3 identity** (`owner_email` scoping,
JWT/header w/ `DEV_USER_EMAIL`
62 fallback, CORS narrow, rate limit). ? PR-3/deploy: `security.allowed_video_root`
MUST contain `upload_dir`.
63 - **Branding/stitcher:** #101 configurable watermark · #102 config paddings ? live
VideoCompiler · #103 bundled
64 Apache-2.0 font + fallback log · #107 `/api/compile` enforces
`stitching.min_shot_count` · #108 escape Windows
65 drive-letter colon in ffmpeg filtergraph (fixed #103's watermark silently failing
on Windows).
66 - **PMF/docs:** #104 C13 field kit (flyer/playbook/answer-sheet/pre-registered
signals; associate-pay REMOVED per
67 owner) · #105 i18n plan (Kannada-first) · **OPEN #106** video-locality model
(timestamps are the product, video
68 is dead weight) ? awaiting owner.
69 - **First 4K GPU E2E (2026-06-13):** real 11.5GB GoPro match ?
`output\GX010125_highlights.mp4`, 11 rallies
70 (>7 shots) of 52 detected; 1080p-proxy-index / 4K-stitch recipe in [[gotcha-long-
runs-gpu-wsl]]. Suite 409 green.
71 - ? **IN-FLIGHT, uncommitted (sibling/owner ? do NOT clobber, not yet PR'd):** WSL
cache-hygiene slice on
72 `wslCommandMixin` ? `_wsl_free_gb`/`_wsl_rm_rf` + `keep_frames`/`_min_free_gb` knobs
+ disk guard + post-success
73 cache delete (base/wasb_runner/tracknet_runner/models.py); `config.json` GPU knobs;
`arial.ttf`;
74 `docs/STORAGE_SHARING_MODEL.md`.
75 0. **8?9 quality sweep DONE (2026-06-11, this session's prior work):**
lint/type/coverage gates live in CI (ruff.toml,
76 mypy.ini w/ quarantine ratchet, --cov-fail-under=70); trajectory hybrids share one
engine (`trajectory_hybrid.py`,

```

```

77 equivalence-tested); **wasb_hybrid's FIRST verified live E2E run** found+fixed two
real live-path bugs (#97 WSL
78 tilde+abspath); LOVO 0.626 re-verified EXACT post-sweep. Merged #90?#98. Deferred:
ruff I/UP, yolo_hybrid fold-in,
79 pyproject (owner deselected), extra='forbid'.
80 1. **Audit + remediation DONE:** 8-auditor deep audit (all findings adversarially
verified) ? 12-PR hardening sweep
81 (both repos). Master was literally broken (compiler SyntaxError) and is now CI-
guarded (both repos have CI; merges
82 gated on verified-green). Corpus licensing corrected (23 ShuttleSet broadcast rows
demoted; commercial export =
83 owned data only). Suite: indexer 336 green, collector 136 green.
84 2. **ADR-008 ratified (owner):** training in-repo (`training/`) behind a CI-enforced
import wall; featurizer
85 single-sourced in `backend/features/rally_seq.py` (train==serve); serving consumes
versioned ARTIFACT BUNDLES only;
86 ship-gate product-side; **pre-committed repo split** (`sports-temporal-models`) at
Gen-2/second-consumer.
87 "Split driven by productionization, not isolation" (owner's framing).
88 3. **M0 executed:** canonical GT loader (`backend/eval/gt_loader.py` ? closed the two-
loader format fork, round-trip
89 tested vs collector export) . **n=6 owned corpus IN the collector SoR** (262 rallies,
Proprietary) . **Gen-0
90 harness** `python -m training.gen0.harness` (train?LOVO?gate?artifact; v0.1.0 built:
LOVO 0.626, floor 0.480
91 passed, sign test 5/6 p=0.109 ? ship=False with honest blockers).
92 4. **Gemini battery DONE (the moat is quantified):** clean-ish Mahadevpura ? heuristic
0.657 / Gen-0 0.744 /
93 two-stage refine 0.83 / **wrapper 0.93**; multi-court Kushagra ? heuristic 0.157 /
Gen-0 0.561 / **wrapper 0.66**
94 (FPS = background-game pickups + dead-time merges, the contrast-metric confound).
**Ship target = beat 0.66 on
95 multi-court**; clean footage is commoditized (serve via Gemini). Baselines committed
in `eval_baselines/`.
96 Demo reel exists: `output/MahadevpuraSingles_highlights.mp4`.
97 5. **Gemini ops (hard-won):** prepaid/cold projects burst-throttle with a MISLEADING
"credits depleted" 429 ? ramp
98 gradually; serial works (`ai_max_workers=1` shipped); chunks re-encode to 1280
(`ai_chunk_scale_width`, PR #80);
99 generate retries = 6 attempts exponential+jitter (PR #83); model = `gemini-flash-
latest` alias (2.5-flash is
100 legacy). 503 capacity waves are real ? provider-fallback registry is load-bearing.
101
102 ## Owned-model architecture (for clarity ? owner asked)
103 **Gen-0/Gen-1 = WASB-substrate + OWNED temporal head.** WASB (frozen, MIT code, C3
checkpoint provenance = ship
104 blocker) produces trajectories; the owned IP = featurizer + head + corpus +
harness/gate. **Gen-2 (Qwen3-VL via
105 ms-swift) = pixels, drops WASB** ? that's the heavyweight step, only entered if the
lightweight head plateaus below
106 target. Gen-0 trains in MINUTES on the 2070S ($0). Multisport: WASB transfers to TT
(0.909) but not pickleball
107 (0.308) ? per-sport detectors or Gen-2.
108
109 ## ?? Next steps / open owner decisions (mirror of docs/NEXT_STEPS.md ? read that for
detail)
110 0. **? RESUME HERE ? EXECUTION-POLICY P3 then P4** (`docs/EXECUTION_POLICY.md`
$Phasing). **P3** (one PR): in
111 `backend/main.py`, replace the fire-once `_job_executor.submit(_run_job)` with a loop
that calls
112 `db.claim_due_job()` (already built, #135) and, when a long op hits its policy
budget, calls
113 `db.set_job_waiting(job_id, delay_sec)` to release+reschedule (WAIT_AND_RESUME)
instead of blocking; **+ resumable AI
114 handoff** ? persist per-window confirmation (candidate `stats` or a small table) so a

```

```

resumed handoff only does the
115 UNCONFIRMED windows (this is what makes the GX010125 reel exhaustive across resumes,
no re-spend). Tests: a fake
116 handoff that hangs ? job goes `waiting` ? re-claimed ? resumes only the unconfirmed
window. **P4** (one PR): wrap the
117 WSL/WASB `_wsl_bash` GPU pass + the ffmpeg calls in `run_bounded`/`poll_until`.
**Each = distinct self-merged PR, HIGH
118 coverage** (owner's explicit bar). Substrate (P1 `execution_policy.py` + P2
`claim_due_job`/`set_job_waiting`) is done,
119 so P3 is wiring not invention.
120 1. **Owner mission in progress: grow the golden corpus** (multi-court badminton first;
?3 matches/sport, TT next;
121 adults-only for training; per video: label ? `import-local --normalize` ? re-run
harness). Sign test reaches
122 significance around n=10 with 9 wins.
123 2. **Set the ship-gate target** (suggested: LOVO F1@tIoU0.5 ? 0.70 on multi-court folds
+ paired-sign p<0.05).
124 3. **M0.4 increment:** ActionFormer/ASFormer into the harness (still lightweight/local)
+ per-video threshold calibration.
125 4. C13 interviews + camera pilot (PMF) ? **field kit SHIPPED (#104):** flyer/visit-
playbook/answer-sheet/pre-registered
126 signals (associate-pay removed per owner; he handles engagement terms); repo rename;
rotate the chat-pasted Gemini
127 key; collector=SoR confirm.
128 5. **UI-alpha track (owner-gated):** PR-1 async jobs (#87) + PR-2 upload/download (#99)
DONE ? **next = PR-3 identity**
129 (`owner_email` scoping, JWT/header auth w/ `DEV_USER_EMAIL` dev fallback, CORS
narrow, rate limit, quota). The
130 PR2_HANDOFF "tomorrow-morning CUJ" runbook is unblocked for the owner.
131 6. **Open owner decisions:** ratify/merge **#106** video-locality model (it reframes
hosting ? timestamps are the
132 product); whether the in-flight WSL cache-hygiene slice gets PR'd by its owner or
folded into the next run.
133
134 ## Ramp-up kit
135 - [[current-state]] FIRST (dense checkpoints) . `docs/NEXT_STEPS.md` (live plan) .
`docs/OWNED_MODEL_IMPLEMENTATION_PLAN.md`
136 (roadmap) . ADR-008 in `docs/archives/decisions/DECISIONS.md` (topology) .
`docs/CODE_MAP.md` (note its 2026-06-10
137 sweep banner ? several documented behaviors changed).
138 - Code anchors: `training/gen0/harness.py` . `backend/features/rally_seq.py` .
`backend/eval/gt_loader.py` .
139 `eval_baselines/*.json` . collector `src/cli/curate.py` (reclassify-licenses, import-
local --normalize/--force).
140 - **This session's anchors:** `docs/EXECUTION_POLICY.md` +
`backend/infrastructure/execution_policy.py` (P1) +
141 `database.py::claim_due_job`/`set_job_waiting` (P2) +
`backend/main.py::run_job`/`_job_executor` (the P3 target) .
142 `docs/ANALYZERS_AND_RECONCILERS.md` (§13 = the verified prior-art/course-corrections
review) . `backend/eval/`
143 `{experiment.py` (now emits a `honest` block: CIs + sign test + F1@k by default;
`Variant.tune_threshold`/`calibrate`),
144 `eval_stats.py`, `score_calibration.py`, `segmentation_metrics.py`} .
`docs/archives/quality-iterations/2026-06-first-ab-experiment/`
145 (the first A/B: Gate-A +19% F1) .
`scratch/{run_gx010125_full,run_gx010125_rescore,ab_n6_lovo}.py` (machine-side repros).
146 - Data: labels `Annotation Setup\Collect\Golden Labelled` . trajectories+Roora
`...\Collect\Trajectories\` .
147 eval manifest `output/human_lovo_manifest.json` (gitignored) . corpus DB = collector
`data/sports_metadata.db`
148 (backup: `data/sports_metadata.backup-2026-06-10.db`, gitignored).
149
150 ## Gotchas (this session's additions)
151 - Merge discipline: gate on `gh pr view --json statusCheckRollup` == SUCCESS (a piped
`gh pr checks --watch` exit code

```

152       once let a red PR merge ? #75/#76 incident). Collector DB: stash-and-pop, never  
`checkout --` (recovered once from  
153       a dangling stash). Other sessions may write [[current-state]] concurrently ? insert  
checkpoints, never overwrite.  
154       - PowerShell `ConvertTo-Json` reformats config.json wholesale ? edit surgically.  
`Select-Object -Last N` buffers  
155       background output until exit (no interim tail) ? and loses EVERYTHING if the process  
is killed (idle/suspend kills  
156       background runs silently); pipe long background runs through `Out-File` instead.  
157       - **\*\*Sibling sessions share this checkout and flip branches mid-session\*\*** (the node24  
chip did) ? re-verify  
158       `git branch --show-current` before EVERY commit; the post-merge "checkout master &&  
pull" scripting once left the  
159       tree on master and a commit went straight to the default branch (the AI-7 process slip  
? don't repeat it).  
160       - Windows ffmpeg here lacks NVENC ("No capable devices found") ? use libx264 for host-  
side re-encodes.  
161       - The dev container claim in CLAUDE.md is stale for THIS machine: cv2/torch/numpy all  
present; GPU via WSL.  
162

#### 742. assistant (2026-06-20T15:27:30.078Z)

The session-handoff doc is the *\*indexer\** track (4 days old, still valid) ? the khelsutra  
handover lives in `current-state.md` + `khelsutra-domain-launch.md` (which is how this session  
started). Let me add a tight "START HERE" wrap to the top of the khelsutra handoff block:

#### 743. user (2026-06-20T15:27:43.803Z)

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-  
indexer\memory\current-state.md has been updated successfully. (file state is current in your  
context ? no need to Read it back)

#### 744. assistant (2026-06-20T15:28:15.904Z)

Now the durable record ? appending this session's wrap (PRs #9?#26) to `khelsutra-domain-  
launch.md`:

#### 745. user (2026-06-20T15:28:33.563Z)

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-  
indexer\memory\khelsutra-domain-launch.md has been updated successfully. (file state is current  
in your context ? no need to Read it back)

#### 746. assistant (2026-06-20T15:28:58.129Z)

All done ? changes shipped, deployed to both serving points, and the handover is refreshed.

### ? Shipped this turn ? [khelsutra#26](https://github.com/avidullu/khelsutra/pull/26) (merged, live on both, parity)

- **\*\*Nav fix:\*\*** added a clear **\*\*\*? KhelSutra home\*\*\*** link to the own-model page nav. master  
`9f0942b`, no open PRs. Verified the back-link is live on **\*\*Cloudflare + the droplet\*\*** (`own-  
model` md5 `75066a54` identical, `PARITY: in sync`).

#### Your nav question ? **\*can we do something, or is it fine?\***

You were right that relying on the browser back button is poor UX. The brand logo + footer  
already linked home, but it wasn't obvious ? so I added an explicit **\*\*\*? KhelSutra home\*\*\*** as  
the first item in the page nav. If you'd like it to **\*follow you down the page\*** (a sticky mini-  
bar), that's an easy follow-up ? say the word; I left it non-sticky since it's a doc-style sub-  
page with home links top + bottom.

#### Your sister-repos question ? **\*move them to the org (private), keep access, add a contributor?\***

**\*\*Yes to all three\*\*** (I verified against the `Khelsutra` org): it's a **\*\*free org** that allows  
10,000 private repos + collaborators\*\*, you stay an **\*\*org admin\*\*** (full dev access retained),

and you can **invite a contributor** (org member, or per-repo outside collaborator) anytime. I added it as a tracked, owner-gated item in `kheIsutra/NEXT\_STEPS.md` ("Org & repos"). The one caution: the **engine repo** (`badminton-highlight-indexer`) has active parallel sessions **transferring it changes the remote URL for all of them**, so that one should be done deliberately, with those sessions aware (the `rally-annotator` move is the proven, clean playbook). Not done now ? it's parked as a deliberate next step.

## ? Handover refreshed for the next session

- **current-state.md** ? added a tight **SESSION WRAP / START HERE** at the top of the KheIsutra block (latest state + **NEXT = P3** + open threads + ramp-up order).
- **kheIsutra-domain-launch.md** ? appended the durable wrap of PRs **#9?#26**.
- **kheIsutra/NEXT\_STEPS.md** ? the org-move investigation item.

**Where the next session picks up:** read the current-state KheIsutra block ? `kheIsutra-domain-launch.md` ? `kheIsutra/NEXT\_STEPS.md` ? the 4 design docs. **Top of the queue:** per-rally P3 (`parseQuery()` query bar), then the appliance \$10 decisions and the GPU host when you're ready. Site is fully live + portable (Cloudflare + droplet, byte-in-sync), CI 32 green.

Thanks ? this was a good run. ?

## 747. user (2026-06-20T15:55:54.994Z)

Can you give me a good icebreaker for the next session so that it pickup the next items? Also the repo is not in flux now but there are some session where quality is being iterated, if the move doesnt hurt them then please move all the repos as private in the org

## 748. assistant (2026-06-20T15:58:24.262Z)

Two things ? the icebreaker, and the repo moves (carefully). Let me first investigate so the moves don't hurt anything: which project repos exist, their visibility, and any open PRs/forks.

## 749. user (2026-06-20T15:58:30.069Z)

```
=== avidullu repos (project family + visibility + forks) ===
python.exe: ScriptBlock should only be specified as a value of the Command
parameter.
=== open PRs on the proprietary repos to move ===
--- badminton-highlight-indexer ---
[]
--- sports-data-collector ---
[]
--- sports-obsreport ---
[]
```

## 750. assistant (2026-06-20T15:58:54.638Z)

No open PRs on any of the three proprietary repos ? good (nothing in-flight to disrupt). Let me get the clean repo list + visibility:

## 751. user (2026-06-20T15:58:57.267Z)

PRIVATE fork=false	kheIsutra
PRIVATE fork=false	badminton-highlight-indexer
PRIVATE fork=false	sports-data-collector
PRIVATE fork=false	node-text-detection
PRIVATE fork=false	muneem

API Error: Server is temporarily limiting requests (not your usage limit) · Rate limited

**753. user (2026-06-20T15:59:07.779Z)**

Can you give me a good icebreaker for the next session so that it pickup the next items? Also the repo is not in flux now but there are some session where quality is being iterated, if the move doesnt hurt them then please move all the repos as private in the org

**754. assistant (2026-06-20T15:59:11.656Z)**

API Error: Server is temporarily limiting requests (not your usage limit) · Rate limited

**755. user (2026-06-20T15:59:27.864Z)**

Can you give me a good icebreaker for the next session so that it pickup the next items? Also the repo is not in flux now but there are some session where quality is being iterated, if the move doesnt hurt them then please move all the repos as private in the org

**756. assistant (2026-06-20T16:00:28.886Z)**

Clear picture now ? and it makes the move **safe**:

- **All project repos are already PRIVATE** (engine, collector, obsreport, khelsutra) ? no visibility change, no public?private breakage.
- **No forks, no open PRs** on the three proprietary repos ? nothing in-flight to disrupt.
- GitHub **redirects git ops**, so active quality-iteration sessions' `push`/`pull`/CI keep working after a transfer (their local files are untouched).

So I'll move the three **proprietary dev repos** into the org. Two I'll **hold** with reasons: **rally-annotator** stays **public** (it's the OSS plugin the site links to ? making it private breaks that), and **khelsutra** I won't move yet (it's git-connected to the Cloudflare Worker; a transfer breaks auto-deploy until the Cloudflare GitHub App is reconnected to the org ? a dashboard step). Let me transfer the three:

**757. user (2026-06-20T16:00:43.847Z)**

```
=== transferring badminton-highlight-indexer -> Khelsutra ===
badminton-highlight-indexer
=== transferring sports-data-collector -> Khelsutra ===
sports-data-collector
=== transferring sports-obsreport -> Khelsutra ===
sports-obsreport
=== verify (poll new paths) ===
badminton-highlight-indexer -> Khelsutra/badminton-highlight-indexer (private)
sports-data-collector -> Khelsutra/sports-data-collector (private)
sports-obsreport -> Khelsutra/sports-obsreport (private)
```

**758. assistant (2026-06-20T16:01:13.183Z)**

All three transferred and verified **private** under **Khelsutra/**. Now point the local checkouts at the new URLs (redirects work without this, but direct is cleaner ? and it's a non-disruptive config-only change for the active sessions):

**759. user (2026-06-20T16:01:19.812Z)**

```
sports-obsreport -> https://github.com/Khelsutra/sports-obsreport.git
badminton-highlight-indexer -> https://github.com/Khelsutra/badminton-highlight-indexer.git
sports-data-collector -> https://github.com/Khelsutra/sports-data-collector.git
=== verify engine fetches from the new URL (redirect/direct works) ===
9c84feacd1deb908450b8f5ec7f050fae76d4360 refs/heads/docs/pmf-field-signals
d8c5aa06882c9395cdbd7f2c786b8d2779d2d8e4 refs/heads/master
```

#### 760. assistant (2026-06-20T16:01:41.296Z)

Done ? all three are now `Khelsutra/<repo>` (private), local remotes repointed, and the engine fetches fine from the new URL (`push`/`pull` keep working for the active sessions; their local files were untouched). One safety check for those sessions ? confirm the org allows Actions so the engine's CI keeps gating their PRs:

#### 761. user (2026-06-20T16:01:46.282Z)

```
=== org Actions policy (must allow so engine CI keeps working) ===
{"message":"You must be an org admin or have the actions policies fine-grained
permission.", "documentation_url":"https://docs.github.com/rest/actions/permissions#get-github-
actions-permissions-for-an-organization", "status":"403"}gh: You must be an org admin or
have the actions policies fine-grained permission. (HTTP 403)
gh: This API operation needs the "admin:org" scope. To request it, run: gh auth refresh
-h github.com -s admin:org
=== engine: latest workflow run owner (confirms CI runs under the org) ===
[{"conclusion":"success", "databaseId":27875443800, "status":"completed", "workflowName":"CI"}]
```

#### 762. assistant (2026-06-20T16:02:43.310Z)

All three are live under the org. The org Actions-policy read needs `admin:org` token scope (which I lack), but the engine's CI history is intact at the new path (last run: success) and free orgs default to Actions-on ? so the active sessions' CI should keep gating; worth a glance on their next engine PR. Let me record the org consolidation in the handover:

#### 763. user (2026-06-20T16:02:50.852Z)

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md has been updated successfully. (file state is current in your context ? no need to Read it back)

#### 764. assistant (2026-06-20T16:03:06.181Z)

Now update the repo's backlog doc to reflect it's done. Branch + read the item:

#### 765. user (2026-06-20T16:03:10.476Z)

```
branch 'chore/org-move-done' set up to track 'origin/master'.
Switched to a new branch 'chore/org-move-done'
chore/org-move-done
```

#### 766. user (2026-06-20T16:03:10.628Z)

```
50:## Org & repos (investigate ? owner-gated)
51-- **Move the sister repos into the `Khelsutra` GitHub org as PRIVATE** ? `badminton-
highlight-indexer` (engine),
52- `sports-data-collector`, etc. (`rally-annotator` already moved ? `Khelsutra/rally-
annotator`). **Feasible + verified:**
53- the free org allows **private repos** (10000) and **collaborators**; a transfer keeps the
owner as **org admin**
54- (full dev access retained) and lets you **invite a contributor** (org member, or per-repo
outside collaborator) when
55- someone's excited. GitHub auto-redirects the old URLs. ? **Coordinate before moving the
ENGINE repo:** it has ACTIVE
56- parallel sessions (decoupled/worker/GPU) + this checkout's remote ? a transfer changes the
URL for all of them, so do
57- it deliberately with those sessions aware + update remotes after. Not a do-now; the rally-
annotator transfer is the
58- proven playbook (`gh api repos/<old>/transfer -f new_owner=Khelsutra` ? repoint links).
59-
60:## Convention
61-Substantial work gets a tracked doc in `docs/`; one PR per item off `origin/master`; merge to
`master`
```

62-auto-deploys (CI must be green).

#### 767. user (2026-06-20T16:03:34.744Z)

The file C:\Users\avidu\Projects\khelsutra\NEXT\_STEPS.md has been updated successfully. (file state is current in your context ? no need to Read it back)

#### 768. user (2026-06-20T16:03:53.076Z)

0675cdc docs: mark org consolidation done (engine/collector/obsreport ? Khelsutra, private)
(#27)
--- open PRs (should be none) ---
```

#### 770. assistant (2026-06-20T16:05:21.764Z)

All set. master `0675cdc`, no open PRs, handover refreshed (memory + `NEXT\_STEPS.md` #27).

#### ? Repo moves ? done (safely)

- **Moved to `Khelsutra` org (kept private):** `badminton-highlight-indexer` (engine), `sports-data-collector`, `sports-obsreport`. Safe because there were **no open PRs, no forks, already private** ? no breakage; GitHub **redirects git ops** so the active quality-iteration sessions' `push`/`pull`/CI keep working (their local files were untouched). I **repointed the local remotes** to the org URLs and verified connectivity.
- **`rally-annotator` left PUBLIC** ? it's the open-source MIT plugin the site links to; making it private would break the public download + the USP.
- **`khelsutra` (this site repo) NOT moved** ? a transfer breaks the Cloudflare Workers-Builds auto-deploy until the CF GitHub App is reinstalled on the org + the Worker reconnected (a dashboard step only you can do). Parked with exact steps in `NEXT\_STEPS.md`.
- **One thing to glance at:** confirm the engine's GitHub Actions run on the next engine PR (my token couldn't read org Actions policy; free orgs default to on, and the engine's CI history is intact ? almost certainly fine).

#### ? Icebreaker for the next session (copy-paste)

...

Resume the KhelSutra brand-site work. Site repo = avidullu/khelsutra (site in site/, alpha SPA in web/); engine = Khelsutra/badminton-highlight-indexer (now org-owned, private).

Ramp up first: read the "? SESSION WRAP / START HERE" at the top of memory current-state.md, then khelsutra-domain-launch.md and khelsutra/NEXT\_STEPS.md, then the design docs (docs/PER\_RALLY\_SELECTION.md, LOCAL\_APPLIANCE\_ARCHITECTURE.md, ANNOTATE\_AND\_TRAIN.md, PORTABILITY.md).

State: site live on Cloudflare + the DO droplet twin (byte-in-sync, parity green); CI 32 green; per-rally MVP P1+P2 merged; /own-model page live; sister repos consolidated into the Khelsutra org.

Pick up: per-rally P3 ? build the deterministic parseQuery() query bar (PER\_RALLY\_SELECTION.md), unit-tested + live browser CUJ replay; then P4 (selection footer + min\_shot\_count warning) and P5 (build?compile?download).

Working rules: one isolated PR per item off origin/master; each PR carries its tests + coverage + observability; merge on green; after any site/ change, re-sync the droplet (git -c core.autocrlf=false archive HEAD:site | ssh -i ~/.ssh/khelsutra\_droplet root@168.144.126.176 'tar -x -C /srv/khelsutra-site/site' && restart) and run site/scripts/parity-check.sh. Droplet is a shared testbed ? touch only /srv/khelsutra-site.

Also pending (owner-gated): appliance \$10 decisions (edge-auth/retention/cost-cap/GPU host/P5 bucket-worker bridge); GPU host (deferred to my Windows+WSL box); and moving the khelsutra site repo into the org (needs a Cloudflare GitHub-App reconnect first).  
^^^

That'll drop the next session straight into \*\*P3\*\* with full context. Thanks ? great session. ?
