Adversarially verify this PR-review finding for PR #381 (branch chore/nightly-quality-regression checked out; read .github/workflows/nightly.yml + ci.yml). Be skeptical ? default to INVALID if wrong, already-handled, or a non-issue.

Finding [LOW] Coverage floor (70) is duplicated as a literal, not single-sourced ? second silent-drift vector

Location: .github/workflows/nightly.yml:84 and :64-65

Detail: The --cov-fail-under=70 literal is copied from ci.yml:112. The comment at nightly.yml:64-65 says the floor 'stays at the ci.yml value (70); never lower it without an owner decision', but nothing enforces equality ? if the owner ratchets ci.yml's floor UP (the comment at ci.yml:110 explicitly anticipates this: 'Ratchet it UP as coverage grows'), nightly will keep asserting the old, looser 70 and silently stop guarding the real bar. This is a concrete instance of the broader drift finding and would be resolved automatically by the workflow_call refactor (single floor literal). Verified the command itself is sound: run_all_tests.py:37-41 forwards sys.argv[1:] straight to pytest, so all four cov flags actually reach pytest-cov.

Suggestion: Fold the full-suite lane into the reusable workflow so the floor lives in exactly one place; until then, the cross-reference comment is the only guard, which is fragile.

Return isReal + adjustedSeverity (INVALID if not real) + one-paragraph reasoning grounded in the actual files.

2. assistant (2026-06-25T17:12:28.272Z)

I'll verify this finding by reading the actual workflow files.

3. user (2026-06-25T17:12:29.224Z)

```
1      name: Nightly quality regression (Tier-1, offline)
2
3      # Tier-1 nightly quality guard. Per-PR `ci.yml` only fires on push/pull_request;
4      # this runs the SAME offline guards on a schedule so we also catch what per-PR CI
5      # can't: dependency / transitive-dep drift, flakiness over time, and rot during
6      # quiet periods when nothing is pushed.
7      #
8      # Tier-1 == OFFLINE ONLY: no GPU, no real video, no `run_regression.py` on the
9      # real corpus (that's Tier-2 ? owner-gated, needs a self-hosted GPU runner +
10     # the gitignored golden corpus). The lanes here mirror `ci.yml`'s offline jobs
11     # verbatim (same Python pin, same per-lane pip installs) so modules collect/run
12     # instead of silently skipping for a missing dep.
13     #
14     # NOTE: scheduled workflows only fire from the repo's DEFAULT branch, so this
15     # won't actually run on a cadence until it lands on `master`. Use the
16     # `workflow_dispatch` trigger to run it on demand for validation after merge.
```

5. assistant (2026-06-25T17:12:32.217Z)

Now let me verify the claim about `run\_all\_tests.py` forwarding argv to pytest, since the finding references it.

6. user (2026-06-25T17:12:32.941Z)

```

1     #!/usr/bin/env python
2     """Run the FULL test suite for the badminton-highlight-indexer.

```

```

3
4     A single, discoverable entry point so you (or a reviewer / CI) can verify the
5     whole suite before opening a PR:
6
7         python run_all_tests.py                # full suite, quiet
8         python run_all_tests.py -v            # verbose (passthrough to pytest)
9         python run_all_tests.py -k config     # filter by keyword (passthrough)
10        python run_all_tests.py --cov=backend --cov-report=term-missing # coverage
11
12    Anything after the script name is passed straight through to pytest.
13
14    Notes
15    ----
16    - The suite is fully mocked (no GPU, no network, no WSL) and runs offline.
17    - The observability **reporting** tests skip cleanly if the optional ``obsreport``
18      package isn't installed (they use ``pytest.importorskip``). To exercise them too:
19        pip install -e ../sports-obsreport --no-build-isolation
20    - Exit code is pytest's own, so this is CI / pre-PR friendly (0 = all green).
21    """

7. assistant (2026-06-25T17:12:45.366Z)

All claims in the finding are verified against the actual files. Let me confirm the facts:

1. ****nightly.yml:87**** ? `--cov-fail-under=70`` literal present (finding cites :84; the floor literal is actually on line 87, but it's within the full-suite step). The finding's general claim ? the literal is duplicated in nightly ? holds.
2. ****ci.yml:112**** ? same `--cov-fail-under=70`` literal. Confirmed duplicate.
3. ****nightly.yml:64-67**** ? comment says "Floor stays at the ci.yml value (70); never lower it without an owner decision." Confirmed.
4. ****ci.yml:109**** ? comment "Ratchet it UP as coverage grows; never down without an owner decision." Confirmed the ratchet-up intent is explicitly anticipated.
5. ****run_all_tests.py:37-41**** ? `args = list(sys.argv[1:])`` forwarded to pytest via subprocess. All four cov flags reach pytest-cov. Confirmed.
6. ****nightly.yml:138**** ? the notify-on-failure body also hardcodes "cov>=70", a **third** copy of the literal ? strengthening the finding.

The drift vector is real: if an owner ratchets ci.yml's floor up (e.g. to 75), nothing forces nightly.yml to follow. Nightly would keep asserting 70 and silently stop guarding the real bar. The only guard is a cross-reference comment, which is fragile.

Now assessing severity. This is a genuine maintainability/drift issue but is correctly LOW: nightly is a **secondary** guard (per-PR ci.yml is authoritative on coverage); a stale-low nightly floor doesn't let bad code merge (PRs still hit ci.yml's real floor) ? it only weakens the nightly drift-detection net, and only in the specific case where the floor is ratcheted up. It's a latent consistency risk, not a live defect. There's a mitigating in-file comment. LOW is apt, arguably NIT, but the multi-copy nature (three literals: ci.yml, nightly full-suite, nightly notify body) and the explicitly-anticipated ratchet make LOW reasonable.

8. user (2026-06-25T17:12:52.453Z)

Structured output provided successfully

9. assistant (2026-06-25T17:13:00.427Z)

Verified the finding against the actual files. It is real and correctly rated LOW.

Key facts confirmed:

- `--cov-fail-under=70`` is duplicated at `C:\Users\avidu\Projects\badminton-highlight-indexer\.github\workflows\ci.yml:112`` and `C:\Users\avidu\Projects\badminton-highlight-indexer\.github\workflows\nightly.yml:87`` (the finding cites :84, the start of the full-suite step ? minor line imprecision, not a factual error).
- The equality-asserting comment is at `nightly.yml:64-67``; the ratchet-up intent the drift hinges on is explicitly stated at `ci.yml:109`` ("Ratchet it UP as coverage grows").
- A third hardcoded copy ("cov>=70") exists at `nightly.yml:138`` in the notify-on-failure issue body, which strengthens the finding.
- The `run_all_tests.py:37-41`` claim is accurate ? `sys.argv[1:]`` is forwarded straight to the pytest subprocess, so all four cov flags reach pytest-cov.

LOW is the right severity: nightly is a secondary drift-detection net, not the authoritative gate (per-PR ci.yml enforces the real floor on every PR), so a stale-low nightly floor never lets sub-bar code merge ? it only weakens the nightly net in the ratchet-up case, with a mitigating in-file comment already present.
