Transcript

1. user (2026-06-06T14:11:25.199Z)

Hello again! Back for another fun session. Can you read the global, session handoff, current state of the github repos linked and tell me whether you can pickup where your last incarnation left off?

2. assistant (2026-06-06T14:11:35.111Z)

I'll ramp up the way the handoff convention says ? read the live state files first, then check the actual repo state to make sure the memory matches reality. Let me pull these in parallel.

3. user (2026-06-06T14:11:36.613Z)

```
1      ---  
2      name: current-state  
3      description: "Live micro-checkpoint state for Claude ? updated every checkpoint (not  
only on request). What just landed, what's next, open decisions."  
4      metadata:  
5          node_type: memory  
6          type: project

9  
10     # Current state ? updated continuously (see [[working-agreement-checkpoints]])  
11  
12     **Checkpoint:** 2026-06-06 (late) · Roora pilot wrapped; per-video tooling started.  
13  
14     ## Merged to master (both repos clean, branches deleted)  
15     - collector #6 (CVAT?canonical adapter), #7 (forced/unforced vocab), indexer #19 (docs).  
16     - Local master pulled + clean in both repos.  
17  
18     ## WASB inference API (reverse-engineered 2026-06-06 ? for the wrapper)  
19     Repo `~/models/WASB-SBDT` (Hydra configs). Usage: `cd src && python3 main.py --config-  
name=eval`  
20     dataset=badminton model=wasb  
detector.model_path=./pretrained_weights/wasb_badminton_best.pth.tar`.  
21     Inference core (`src/runners/eval.py::inference_video`): build detector + tracker +  
dataloader ?  
22     loop batches `(imgs, hms, trans, ...)` ? `detector.run_tensor(imgs, trans)` ? per-frame  
preds ?  
23     `tracker.refresh()` then `tracker.update(preds)` per frame ? `result_dict[img_path] =  
{x,y,visi,score}`.  
24     That dict IS the trajectory we want.  
25     - `TracknetV2Detector(cfg)` (`src/detectors/detector.py`): builds model via  
`build_model(cfg)`,  
26     loads `cfg.detector.model_path` (`checkpoint['model_state_dict']`), DataParallel,  
eval. Needs
```

```

27     CUDA (asserts GPU). `frames_in`=cfg.model.frames_in, `input_wh`=(model.inp_width,
inp_height).
28     `run_tensor(imgs, affine_mats)` ? model ? postprocessor ? per-frame (x,y,visi,score).
29     Preprocessing helpers: `dataloaders.build_img_transforms/read_image/get_transform`,
30     `utils.image.get_affine_transform/affine_transform`.
31     - eval.yaml defaults: model=wasb, detector=tracknetv2, tracker=online,
transform=default.
32     - **Wrapper plan:** extract video frames ? build `frames_in` sliding windows + affine
`trans`
33     (mirror dataset `__getitem__`) ? run detector+tracker ? emit CSV
**`Frame,Visibility,X,Y`**
34     (EXACTLY what existing `tracknet_runner.parse_trajectory_csv` +
`trajectory_to_action_windows`
35     already consume ? big reuse). Use weights `wasb_badminton_best.pth.tar` (NOT
monotrack=noncommercial).
36     - **Build steps:** (1) `backend/detectors/wasb_infer.py` ? **DONE + VALIDATED** (branch
37     `feat/wasb-substrate`, pushed, not yet PR'd). Runs in WSL `wasb` env; reuses WASB
ImageDataset
38     transform + detector + online tracker; emits Frame,Visibility,X,Y. Verified on
rally-18 clip
39     (121 frames ? 107 visible, X439-1036/Y64-586, smooth = real shuttle track).
40     **GOTCHAS:** must run from `~/models/WASB-SBDT/src` in `wasb` env; Hydra overrides
need
41     `runner.gpus=[0]` (single-GPU box) + `runner.device=cuda`; `__getitem__` lives in
42     `dataloaders/dataset_loader.py::ImageDataset` (samples =
`{'frames':[paths], 'annos':[[frame_path,
43     center:Center(is_visible,x,y)]]}); read frames via /mnt (Google-Drive G: extraction
done on
44     Windows ffmpeg). To run: `conda activate wasb && cd ~/models/WASB-SBDT/src && python
wasb_infer.py
45     --frames_dir <dir> --weights ../pretrained_weights/wasb_badminton_best.pth.tar --out
<csv>`.
46     (2) `wasb_runner.py` ? DONE (Win adapter: stage video+script to WSL ? run `wasb` env ?
CSV;
47     REUSES `TrackNetRunner.parse_trajectory_csv`/`trajectory_to_action_windows` as
staticmethods ?
48     those are class staticmethods, NOT module funcs; only
`to_wsl_mnt_path`/`TrajectoryPoint` are
49     module-level). (3) `wasb_hybrid.py` ? DONE (mirrors tracknet_hybrid; registered
"wasb_hybrid";
50     reads thresholds from idx_cfg.wasb). All on branch `feat/wasb-substrate` (pushed, NOT
PR'd).
51     Suite 159 green; registry lists wasb_hybrid. **NOT yet end-to-end run**: full-video
WSL pass +
52     AI handoff untested (wasb_infer core IS validated on real frames). config.json needs
an
53     `indexing.wasb` section (defaults exist in WasbConfig). (4) per-video calibration
**Workflow**
54     = DEFERRED (user will call it). Calibration only needs Phase-2 windows (no AI
handoff/API).
55     Preprocessing (RESOLVED): `configs/model/wasb.yaml` ? name=hrnet, frames_in=3,
frames_out=3,
56     inp 512x288 (WxH). `dataloaders/__init__.py build_img_transforms`: T.ToTensor +
Normalize
57     mean[0.485,0.456,0.406]/std[0.229,0.224,0.225] (ImageNet). Resize via affine
(`utils.image.
58     get_affine_transform` ? input_wh; the affine matrix is the `trans`/`affine_mats`
passed to
59     run_tensor and used to map heatmap coords back to original frame). So wrapper: per
sliding window
60     of 3 consecutive frames ? affine-resize to 512x288 ? ToTensor+Normalize ? stack ?
detector.run_tensor
61     ? tracker ? (x,y,visi,score) per frame ? CSV Frame,Visibility,X,Y. Weight variant:
wasb_badminton_best.
62

```

```

63     ## GOAL CORRECTION (user clarified 2026-06-06 ? important)
64     User wants to "make the WASB pretrained WEIGHTS more robust with the 1 annotated video."
Honest reality:
65     - Our annotation = **temporal rally [start,end]** labels, NOT per-frame shuttle (x,y).
WASB is a shuttle
66     DETECTOR (needs x,y heatmap supervision). **So the rally labels CANNOT fine-tune
WASB's detector weights.**
67     - What the 1 video CAN quantifiably improve = the **rally-SEGMENTATION layer on top of
WASB**: the 3
68     windowing thresholds (velocity_thresh/merge_gap/min_window_duration) + WASB variant
choice. Measure
69     IoU/F1 on HELD-OUT golden rallies (calibrate on K, test on rest). That's the
"quantifiable improvement".
70     - To genuinely fine-tune WASB DETECTOR weights ? need per-frame shuttle (x,y) labels (a
different
71     annotation, or pseudo-labels) ? separate track, not this annotation.
72     - Also: neural weights are found by backprop, not by agents "trying weights +
coordinating". Agents are
73     the right tool for the CONFIG search (variant × 3 thresholds × strategy), not weight
space.
74
75     ## Tuning plan = a Workflow (per user's ultracode ask), runs AFTER the wrapper exists
76     Once WASB trajectories exist: run a parallel **calibration Workflow** ? agents
independently search
77     {WASB variant × velocity_thresh × merge_gap × min_window_duration × search-strategy},
each scored on
78     held-out golden rally IoU, coordinate ? pick max-precision config. (Can't run before a
trajectory exists.)
79
80     ## ? PLAN: checkpoint the heavyweight WASB pass (resume across restarts) ? IMPLEMENT
NEXT SESSION
81     Problem: the GPU detector pass (21k forward passes) writes the trajectory ONLY at the
end, so a
82     reboot mid-pass loses all of it (happened 2026-06-06).
83     Key insight: **decouple the expensive GPU detector pass (checkpoint incrementally) from
the cheap,
84     stateful CPU tracker pass (just re-run from the cache).** The online tracker can't
resume
85     mid-stream, but if per-frame DETECTOR outputs are cached, the tracker re-runs over them
in seconds.
86     Plan (prioritised):
87     1. **Stable cache dir keyed by video MD5** (not %TEMP%): `output/wasb_cache/<md5>/` with
`frames/`,
88     `det_raw.jsonl` (incremental detector outputs), `trajectory.csv`, `manifest.json`
89     {video_md5, frames_total, frames_done, cfg}. (Ties to the indexer MD5-keying gotcha.)
90     2. **Idempotent extraction:** skip if frame count already == expected.
91     3. **Incremental detector cache (the big win):** in wasb_infer's batch loop, append each
batch's
92     per-frame raw detections to `det_raw.jsonl` and FLUSH every ~1000 frames; on startup
read
93     manifest/det_raw ? skip already-done frames ? resume. Loss bounded to <1000 frames
(~secs of GPU).
94     4. **Tracker re-run:** once all frames are detected (fresh or resumed), run the tracker
over the full
95     `det_raw.jsonl` in order ? `trajectory.csv`. Cheap, deterministic, re-runnable.
96     5. **Atomic writes** (write .tmp then rename) so a crash mid-write can't corrupt the
cache.
97     6. (Optional) expose as one resumable CLI stage.
98     Effort: moderate ? mostly a wasb_infer refactor (incremental det cache + resume); the
tracker
99     decoupling is the core design. Calibration grid stays cheap (operates on the cached
trajectory) ?
100    no checkpointing needed there.
101
102    ## ? STEP 4 ? FIRST CALIBRATION DONE (2026-06-06) ? RESULT

```

```

103     Full WASB trajectory of the long badminton video: 21,284 frames, 37% visible-shuttle
(sane).
104     `calibrate_wasb` on 25 golden rallies (IoU 0.5):
105     - baseline thresholds (0.02,2.0,2.0): precision 0.577, recall 0.600, F1 0.588,
meanIoU 0.765.
106     - tuned (0.05,1.0,1.0): F1 0.746 ? precision +12.2%, F1 +26.8% (OPTIMISTIC ?
grid fit on full GT).
107     - HONEST (5-fold cross-val): held-out recall 0.88 ± 0.16, generalization_gap +0.000
(no overfit).
108     - Caveats: +X% is optimistic upper bound; honest within-video metric is RECALL;
precision/F1
109     generalization needs a 2nd labelled video ? `leave_one_video_out`. std ±0.16 = small
sample.
110     - Driver `backend/eval/calibrate_wasb.py` was LOST from master in #21's branch-delete ?
RECOVERED
111     in PR #24 (merged). Trajectory cached at `~/clips/sample_long_traj.csv` (+ `C:\?\Temp\
sample_long_traj.csv`); frames at `C:\?\Temp\sample_long_frames` (4.1GB, deletable).
112     - NEXT: export tuned segments for user manual-verify; 2nd labelled video for honest
precision;
113     implement WASB-pass checkpointing (plan below); optional multi-agent tuning Workflow.
114
115
116     ## (historical) STEP 4 IN PROGRESS (2026-06-06)
117     - PR #21 open (feat/wasb-substrate: substrate + calibration.py + `calibrate_wasb.py`
driver +
118     HOW_RALLY_DETECTION_WORKS doc). Suite 171 green.
119     - Calibration driver DONE + tested: `backend/eval/calibrate_wasb.py` (grid over
velocity_thresh/merge_gap/min_window_duration ? improvement_report + cross_validate).
Run:
120
121     `python -m backend.eval.calibrate_wasb --trajectory ~/clips/sample_long_traj.csv (copy
to Win)
122     --labels "<Annotation Setup>/golden_labels_badminton.csv" --fps 59.94 --frame-width
1920`.
123     - GOTCHA: WSL CANNOT see Google Drive `/mnt/g` (first pass b04odl4jl failed: "cannot
stat
124     /mnt/g/..."). Fix: copy the video G:C: on the Windows side first (`cp "/g/My
Drive/.../Sample
125     Long Video - Baadminton.MP4" /c/Users/avidu/AppData/Local/Temp/sample_long.mp4`, ~9s,
cached),
126     then WSL reads it via `/mnt/c`.
127     - PERF GOTCHA: wasb_infer's cv2 `imwrite` PNG extraction is pathologically slow
(~5fps ? ~1hr
128     for 21k frames, GPU idle the whole time). FIX: extract with ffmpeg (Windows, reads
the C:
129     copy): `ffmpeg -i C:\...\sample_long.mp4 -q:v 2 C:\...\sample_long_frames\%08d.jpg`
(21284 frames
130     in 3.5 min, 4.1GB JPG). Then `wasb_infer --frames_dir` (now defaults
batch_size=8,
131     num_workers=4 ? GPU ~80-90%). ffmpeg NOT in WSL; use Windows ffmpeg. wasb_infer
globs *.jpg too.
132     - RESTART RECOVERY (2026-06-06): laptop rebooted mid-inference. The 21,284 extracted
frames
133     (`C:\Users\avidu\AppData\Local\Temp\sample_long_frames`) + staged video survived (Temp
persisted);
134     trajectory CSV was NOT written (writes only at end). Resume = just RE-RUN the
inference command
135     below on the existing frames (NO re-extraction). Relunched as task brmhav6x. The
136     `wasb_infer.py` batch/workers change is uncommitted on master working tree (commit
after verify).
137     - Full-video WASB inference RUNNING (task brmhav6x; orig b4pqhqkte died on reboot):
`wasb_infer.py --frames_dir
138     /mnt/c/Users/avidu/AppData/Local/Temp/sample_long_frames --weights
139     ../pretrained_weights/wasb_badminton_best.pth.tar --out ~/clips/sample_long_traj.csv
140     --batch-size 8 --num-workers 4`. GPU confirmed ~80-90%, 6.4/8GB. Writes CSV at the
end. When done:
141     copy CSV to Windows (or read /mnt) ? run the driver above ? the "+X%" + cross-val.

```

Then clean

```
142 up `~/clips/sample_long_frames` (~30-40GB). Calibrate ONLY on the labelled Sample Long
Video
143 (only one with golden labels); a 2nd labelled video later ? leave_one_video_out.
144
145 ## NEXT-SESSION RUNBOOK ? step 4 (the actual calibration run)
146 Substrate (wasb_infer/runner/hybrid) + eval harness (calibration.py) are DONE on
147 `feat/wasb-substrate` (pushed). To submit:
148 1. **Full-video WASB trajectory (the slow long pole ? do first, cache it).** Untested at
full
149 scale; expect a debug lap. Two paths:
150 (a) via runner: `WasbRunner(WasbConfig()).run_predict(<video>, "output/wasb")` ?
stages 2.8GB
151 into WSL (off G: = possibly slow/flaky) + extracts frames + runs. OR
152 (b) safer: extract frames on Windows (ffmpeg from G:, proven) ? run in WSL:
153 `conda activate wasb && cd ~/models/WASB-SBDT/src && python wasb_infer.py
--frames_dir <dir>
154 --weights ../pretrained_weights/wasb_badminton_best.pth.tar --out
~/clips/full_traj.csv`.
155 Watch: disk for ~21k PNGs, GPU mem, /mnt read speed. Validate visible-shuttle % is
high during
156 known rallies, ~0 during dead time.
157 2. **GT** from `Annotation Setup/golden_labels_badminton.csv` ? rally [start,end] in
seconds
158 (use the verified rows; skip the 1 missed row whose end is still TBD = rally 7.5).
159 3. **Write the calibration driver** (not yet written): `predict_fn(cfg)` =
parse_trajectory_csv(full_traj)
160 ? `TrackNetRunner.trajectory_to_action_windows(points, fps=59.94, frame_width=1920,
**cfg)` ?
161 [start,end]; cfg = {velocity_thresh, merge_gap, min_window_duration}. Grid over
those.
162 4. **Run** `backend/eval/calibration.py`: `improvement_report(predict_fn, baseline_cfg,
best_cfg, GT)`
163 for the "+X%"; `cross_validate` (within-video recall + gap) for the overfit check.
(Only 1 video
164 now ? leave_one_video_out waits for more videos = the real generalization metric.)
165 5. Optional: the **multi-agent tuning Workflow** (token-heavy) instead of a plain grid
in step 3.
166
167 ## Eval/overfit harness BUILT + license soul-check (2026-06-06)
168 - `backend/eval/calibration.py` (on `feat/wasb-substrate`, 9 tests; segmenter-agnostic
predict_fn):
169 `improvement_report` = baseline-vs-tuned %? precision/F1 (the "+X%"); `cross_validate`
=
170 within-video k-fold, default metric **recall** (global windows vs a GT *subset* can't
fairly
171 score precision), reports `generalization_gap` (train?test = overfit alarm);
`leave_one_video_out`
172 = the honest metric as videos arrive (pick config on others, score held-out). This is
the
173 overfitting guard for "more videos coming."
174 - **LICENSE:** CODE clean ? WASB-SBDT MIT (verified), torchvision/supervision
permissive, AGPL
175 Ultralytics gone (PR #8), MonoTrack never referenced (default = wasb_badminton_best).
?? OPEN:
176 WASB *weights* trained on academic NYCU/TrackNetV2 data ? confirm terms or retrain
before
177 COMMERCIAL deploy (fine for R&D). See [[tracknet-wasb-wsl2-decision]].
178
179 ## Step-3 substrate finding (2026-06-06)
180 - WASB IS the plan and is ~ready: `wasb` WSL env + WASB-SBDT repo + pretrained badminton
weights
181 all present (verified); healthcheck OK (TF2.17/GPU). The wired `tracknet_runner`
targets
182 TrackNetV4 = NOT runnable (no weights, repo not cloned). To use WASB: build inference
```

```

wrapper +
183     runner adapter + `wasb_hybrid` segmenter, then calibrate
`velocity_thresh/merge_gap/min_window_duration`
184     vs golden labels (eval held-out). See [[tracknet-wasb-wsl2-decision]] STATUS
2026-06-06.
185
186     ## Merged: #6, #7, #19, #8, #20, **#9 (validate-delivery)**
187     - collector master has: adapter, forced/unforced vocab, last_shot_outcome (two-field).
188     - indexer master has: docs mirror, rally slicer (`backend/tools/rally_slicer.py`).
189
190     ## Open PR (pushed, awaiting merge)
191     - **collector #9** `feat/validate-delivery` ? per-video QA gate. `curate validate-
delivery`
192     (CVAT or CSV) ? `_report.md`/`.json` + `_review.csv` (auto manual-verify
sheet);
193     exit!=0 on blocker. New `possible_missed_rally` gap check.
`docs/INGESTION_PIPELINE.md` FAQ.
194     104 tests; verified on real delivery (BLOCKED on 1?2 overlap, flags 2/7/16).
195
196     ## Pilot status ? DONE verifying
197     - User verified **all** rallies: only the previously-flagged rows are issues;
**everything else
198     is clean trainable data**. The [start,end] intervals are settled ? **segmentation GT
is ready**
199     (ending_reason/outcome specifics for flagged rows are metadata, not needed for
temporal seg).
200     - Golden master: `C:\Users\avidu\Projects\Annotation Setup\golden_labels_badminton.csv`
201     (24 + 2 missed = rallies; 7.5 @1:46.031 confirmed via screenshot; 16.5 = 3:34?3:43).
202
203     ## Decisions locked
204     - **Two-field ending**: `ending_reason` (why) + `last_shot_outcome` ? {in,net,out,n_a}
(where).
205     - **Accept Roora's CVAT export** ? adapter ingests it; do NOT ask them to switch to CSV.
206     - **Absorb timestamps** ? adapter recomputes `seconds = frame/fps`; mm:ss also parsed
everywhere
207     (indexer parse_timestamp / collector parse_time_string / compiler / slicer). Minor
slack
208     absorbed by VideoCompiler padding (0.5/1.0s). Don't ask Roora to fix time computation.
209     - Roora report (`Annotation Setup\Roora Pilot Review ? Badminton (2026-06-06).md`)
revised to
210     only ask for what code can't fix: **completeness (no missed rallies), one-box-per-
rally
211     boundaries, add `last_shot_outcome` dropdown, pickleball/TT scope.**
212
213     ## Next steps (sequence 1?2?3, user approved)
214     > User will get **5?6 30-min+ videos** annotated soon ? the **validation phase must be
ready**
215     > to auto-check each delivery against our conventions BEFORE that lands.
216     1. ? **last_shot_outcome vertical** ? MERGED (#8).
217     2. ? **validate-delivery framework** ? DONE (collector PR #9, awaiting merge). Label-
only gap
218     heuristic for missed rallies (a motion-based 2nd opinion over raw video is a future
enhancement).
219     3. (claude) **NEXT: per-video calibration loop** ? slicer merged (#20); tune segmenter
thresholds
220     on K labeled rallies, measure IoU on the HELD-OUT rest (no leakage). Then learned
fine-tuning.
221     4. (claude) Build segmentation GT from golden labels ? convert-cvat/import-local/export
(the
222     actual "train on my own video" step; needs the corrected golden labels, overlap
already resolved).
223
224     ## Open design threads
225     - Per-video few-shot adaptation: calibration first (static camera = good case), honest
eval

```

226 (held-out rallies). cf. train/eval guardrail in [[collector-indexer-bridge]].
227

4. user (2026-06-06T14:11:37.065Z)

9
10   # Session handoff ? badminton-highlight-indexer (+ sibling sports-data-collector)
11
12   **Last updated:** 2026-06-06 . **Refresh trigger:** say "update the handoff".
13   Pointer, not a duplicate. **For the freshest blow-by-blow state, read [[current-state]]
first**
14   (updated every micro-checkpoint); this handoff is the slower ~1-page orientation.
15
16   ## You are here (current state)
17   - **Roora pilot reviewed** (badminton only delivered, as CVAT boxes). User verified
**all** rallies:
18       only the flagged ones are issues; everything else is **clean trainable data**.
Feedback PDF +
19       1:46 screenshot in `Projects/Annotation Setup/6 June 2026/Feedback/`. Golden labels
(corrected,
20       two-field) at `Projects/Annotation Setup/golden_labels_badminton.csv`.
21       - **Ingestion pipeline built (collector)** ? merged: CVAT?canonical adapter (`convert-
cvat`),
22       forced/unforced vocab, `last_shot_outcome` two-field (+ db migration). In PR: **9
23       `validate-delivery`** (per-video QA gate ? report.md/.json + auto review.csv; FAQ in
24       `docs/INGESTION_PIPELINE.md`).
25       - **Indexer** ? merged: rally **slicer** (`backend/tools/rally_slicer.py`) + docs.
26       - VLC media-time overlay is permanent (Lua `timeosd` intf) for manual verification.
27
28       ## Next steps / open threads
29       - **Clean slate (2026-06-06 wrap):** all WASB work MERGED ? PR #21 (substrate
wasb_infer/runner/
30       wasb_hybrid + calibration.py + calibrate_wasb driver + HOW_RALLY_DETECTION_WORKS) and
PR #22
31       (GPU throughput: batch/workers). master clean; suite 171 green.
wasb_infer/runner/hybrid ?,
32       eval+calibration harness ?, calibration driver ?.
33       - **Step 4 ? FIRST CALIBRATION DONE** (2026-06-06): on 25 golden rallies, baseline F1
0.588 ?
34       tuned (0.05,1.0,1.0) **F1 0.746** (+26.8% / precision +12.2%, *optimistic* = grid fit
on full GT);
35       **honest 5-fold held-out recall 0.88 ± 0.16, generalization_gap +0.000 (no overfit).**
Trajectory
36       cached `~/clips/sample_long_traj.csv` (+ C:\?\Temp). Driver `calibrate_wasb.py` was
lost from
37       master in #21's branch-delete ? recovered in **PR #24** (merged). NEXT: export tuned
segments for
38       user eyeball; 2nd labelled video ? honest cross-video precision
(`leave_one_video_out`); WASB-pass
39       checkpointing; optional multi-agent tuning Workflow. ? Historical detail of the first
pass: Frames extracted (21,284 JPGs in
40       `C:\?\Temp\sample_long_frames`, via ffmpeg ~3.5min ? cv2 too slow). Inference running
(GPU ~80-90%);
41       trajectory ? `~/clips/sample_long_traj.csv`. Survives reboots? NO yet (see plan
below). To run/
42       resume: `wsl ? conda activate wasb && cd ~/models/WASB-SBDT/src && python
```

```

wasb_infer.py
43     --frames_dir /mnt/c/Users/avidu/AppData/Local/Temp/sample_long_frames --weights
44     ../pretrained_weights/wasb_badminton_best.pth.tar --out ~/clips/sample_long_traj.csv
45     --batch-size 8 --num-workers 4`. Then **Checkpoint 4:** `python -m
backend.eval.calibrate_wasb
46     --trajectory <traj> --labels golden_labels_badminton.csv --fps 59.94 --frame-width
1920` ?
47     the "+X%" + cross-val; export tuned segments ? user manual-verifies "are rallies
better?".
48     - **? TODO (next session): implement WASB-pass checkpointing** so reboots resume (a
reboot lost
49     the inference once). Full design in [[current-state]] ("PLAN: checkpoint the
heavyweight WASB
50     pass"): cache per-frame DETECTOR outputs incrementally (flush every ~1000) in a stable
51     md5-keyed cache dir; re-run the cheap CPU tracker over the cache; idempotent
extraction; atomic
52     writes.
53     - See [[current-state]] for exact gotchas (/mnt/g not visible, ffmpeg-not-in-WSL,
gpus=[0]) + the
54     2-layer model
55     in indexer `docs/HOW_RALLY_DETECTION_WORKS.md`.
56     - **GOAL CORRECTION (important):** rally labels are temporal ? they tune the
**segmentation layer**
57     (thresholds), NOT WASB's shuttle-detector weights (those need x,y labels). The
"quantifiable
58     improvement" is held-out rally IoU lift from per-video threshold calibration. Genuine
detector
59     weight fine-tuning = separate track needing shuttle-coordinate labels.
60     - **Roora go/no-go:** send the PDF, get verbal confirmation issues are addressable, then
require a
61     **corrected pilot re-delivery that passes `validate-delivery`** (esp. zero missed
rallies) BEFORE
62     committing to the 5?6 bulk 30-min videos. Pickleball + TT still not delivered.
63     - Bulk data incoming (5?6 × 30-min) ? validation gate is now ready for it.
64
65     ## Ramp-up kit (read these to get current)
66     - [[current-state]] (live), this handoff, [[working-agreement-checkpoints]], [[working-
agreement-attribution]].
67     - Collector: `docs/INGESTION_PIPELINE.md` (E2E FAQ), `docs/annotation/ROORA_BRIEF.md` +
`ANNOTATION_GUIDE.md`,
68     `src/parsers/cvat/rally_cvat.py`, `src/cli/curate.py` (convert-cvat / validate-
delivery / import-local / export).
69     - Indexer: `backend/tools/rally_slicer.py`, `backend/eval/{metrics,annotations}.py`,
`backend/stitcher/compiler.py`.
70     - Memory notes: golden-set-vendoring, collector-indexer-bridge, candidate-segments-
finetuning.
71
72     ## Key decisions (don't relitigate without reason)
73     - **Accept Roora's CVAT export**; absorb format + timestamps in our adapter (don't make
them change workflow).
74     - **Two-field ending**: `ending_reason` (why) + `last_shot_outcome` (in/net/out/n_a,
where).
75     - Time = `frame / true_fps` (ignore vendor's frame/900); ~0.5s slack absorbed by
compiler padding.
76     - Per-video adaptation = **calibration first** (static camera), honest eval on held-out
rallies; never mix train/eval globally.
77     - Workflow: frequent **small PRs** + continuous [[current-state]] updates (this handoff
only on request).
78

```

5. user (2026-06-06T14:11:38.054Z)

<system-reminder>This memory is 6 days old. Memories are point-in-time observations, not live state ? claims about code behavior or file:line citations may be outdated. Verify against current code before asserting as fact.</system-reminder>

1      ---
2      name: collector-indexer-bridge
3      description: "Plan to feed sports-data-collector's rally annotations into the indexer to
train/eval a generic temporal rally segmenter"
4      metadata:
5          node_type: memory
6          type: project
7          originSessionId: 7572cbc9-3822-461e-8779-c8cec498cde9
8      ---
9
10     Goal: use `sports-data-collector`'s commercially-licensed rally annotations to **train
and evaluate a generic temporal rally segmenter** in `badminton-highlight-indexer`, reusable
across sports (badminton/tennis/cricket share a `(video_id, ordinal, start_time, end_time)`
shape).
11
12     Key reframing established 2026-05-26: the indexer's `yolo_hybrid` segmenter uses **a
stock person detector (person class only) + a velocity heuristic** ? there is no trained
badminton model. (As of 2026-05-30 that detector is **torchvision Faster R-CNN + supervision
ByteTrack**, swapped off AGPL Ultralytics YOLOv8 ? PR #8/ADR-005; the velocity-heuristic logic
is unchanged.) The collector's data is **temporal-only** (rally `[start,end]`, stroke counts,
scores; NO per-frame shuttle `(x,y)`). So this data trains/tunes the **temporal segmentation**
stage, NOT a shuttle object detector (that needs coordinate labels ? see [[tracknet-wasb-
wsl2-decision]] and [[candidate-segments-finetuning]]).
13
14     Golden-set ground truth for eval (beyond the collector's own annotations) is now planned
via **third-party annotation vendors** on licensed/owned video ? design + vendor shortlist in
[[golden-set-vendoring]].
15
16     Phased plan (user picked: train a temporal segmenter; exporter lives as a collector CLI
subcommand):
17     - **Phase 1 (DONE):** `python -m src.cli.curate export` in sports-data-collector. Emits
`<out>/<sport>/<video_id>.csv` (indexer `start,end` format) + `manifest.json`. Filters curated +
`is_commercial` by default. Code: `SportsDatabase.get_segment_intervals()` + `SEGMENT_TABLES`
map in `src/core/db.py`; `export_eval_set()` in `src/cli/curate.py`.
18     - **Phase 2 (code DONE; bulk re-fetch BLOCKED on cookies):** on-disk videos were
**256x144** because the crawler hard-coded `yt-dlp -f worstvideo`. Fixed:
`src/core/downloader.py` always fetches best resolution (`bv*+ba/b -S res,...`, merged mp4,
ffprobes actual w/h/fps, pins `youtube:player_client=web_safari`, enables EJS solver `--remote-
components ejs:github`, auto-adds `~/deno/bin` to PATH). New `curate fetch` re-downloads
existing DB entries at best res, updates `local_path`/`resolution`/`fps` **in place** (rallies +
curation preserved ? NO clean slate). Guard: below-min-height downloads are discarded, not
committed. deno 2.8.0 installed. Both repos now on GitHub under `avidullu` (badminton-highlight-
indexer; sports-data-collector created PRIVATE 2026-05-26); both `master` in sync with origin.
19     - **RESOLVED + COMPLETE (2026-05-26):** root cause of persistent 144p was the
`web/web_safari` clients being forced into SABR streaming (strips download URLs); fix =
`player_client=default` + authenticated Firefox Premium cookies (`--cookies-from-browser
firefox`; Firefox reads cleanly on Windows, Chrome blocked by DPAPI app-bound encryption
#10927). Bulk batch initially failed all-at-once from YouTube rate-limiting ? added
`--sleep`/`--retries`/`--retry-backoff` to fetch. Final result: **all 22 fetchable badminton
matches now true 1920x1080** (verified on disk, rallies intact), DB committed. Unfetchable:
shuttleset_12 (no URL in ShuttleSet catalog), my_custom_local_match + staging_match_non_comm
(mock/non-commercial). ~26GB in data/videos (gitignored). ShuttleSet corpus tops out at 1080p
(no 4K). **Phase 2 done.**
20     - **Phase 3 (IN PROGRESS):** eval/tune loop. Built `run_phase3_eval.py` +
`backend/eval/batch.py` in indexer (walks manifest, processes each video, scores vs GT, per-
video + corpus aggregate; pure helpers tested). Loop validated on 1 video with `motion`.
Committed on indexer branch `feat/phase3-eval-and-offline-roadmap`. Indexer `output/` is
gitignored. NOTE: indexer validators gate on min_fps 29.9 but ShuttleSet videos are 25fps ? the
driver calls the segmenter directly, bypassing the validation gate.
21     - **Phase 3 EVIDENCE (2026-05-26):** ran motion (shuttleset_1) + yolo_hybrid
(shuttleset_8). Findings: (1) Gemini key is FREE TIER (20 req/day) ? 429 quota ? API path dead,
pivot vindicated. (2) Processing is SLOW (~50min per 1080p video). (3) **YOLO candidate recall
0.05@IoU0.5** (0.72@0.01; 72% rallies have some overlap but median coverage ~20%); **merging
candidates does NOT help**. Root cause: broadcast camera TRACKS players ? player pixel-velocity
is a poor rally proxy (designed for static GoPro). `motion` also useless (0 TP). ? **Offline

```

substrate decided: WASB shuttle-motion (ADR-001), NOT YOLO.** Caveat: 1 video, confirm on 2-3 more via free candidates-only YOLO pass. Already-built training-data + classifier layers (`backend/eval/training.py`, `classifier.py`, committed on branch `feat/phase3-eval-and-offline-roadmap`) are substrate-agnostic ? will consume WASB windows/features.

22 - **Phase 4 (NEXT ? direction set 2026-05-26):** build an OFFLINE, API-free learned segmenter (e.g. `yolo\_learned`) ? replace the Gemini refinement with a lightweight classifier trained on rally annotations + already-stored `candidate\_segments.stats`. User explicitly wants NO external API. Substrate (YOLO player-motion features vs WASB shuttle-motion) decided by the **candidate-stage recall** from the running yolo_hybrid validation: high recall ? YOLO features; low ? WASB. Full paid 22-video Gemini eval NOT run (only 1 reference video). Decisions documented: indexer `docs/ROADMAP.md` + `docs/DECISIONS.md` ADR-002/003/004; collector `docs/PIPELINE\_ROLE.md`.

23

24 **Critical integration gotcha:** indexer keys videos by **file MD5**, collector by human `video\_id`. Re-encoding/downloading changes bytes?MD5, so acquisition must precede processing and the manifest tracks which exact file was used.

25

6. user (2026-06-06T14:11:38.946Z)

1 ---

2 name: golden-set-vendoring

3 description: Plan to generate golden-set rally labels via third-party vendors + an extensible regression-testing flow

4 metadata:

5 node_type: memory

6 type: project

7 originSessionId: aa329f09-28b7-4acc-b062-98ec7e905abc

8 ---

9

10 How we produce trusted **golden-set ground truth** (hand-verified rally `[start,end]` labels) and use it to regression-test the production tool. Full design + vendor shortlist is version-controlled in `docs/GOLDEN\_SET\_VENDORING.md` (and ADR-006); this file holds the durable decisions.

11

12 **Keystone insight:** a vendor's label CSV is structurally identical to a pipeline prediction, so the existing `backend/eval/metrics.py` (`interval\_iou`?`match\_intervals`?`score`) grades all three of: product-vs-GT, vendor-vs-answer-key, and annotator-vs-annotator (IAA). No new scoring code ? only a new *source* of intervals.

13

14 **Decisions locked with the user (2026-05-30):**

15 - **Licensed/owned video only** ? vendors never see user uploads (this is the monetization **privacy lever**, see [[monetization-plan]]). Start corpus = the user's own growing match collection + ShuttleSet.

16 - **Rally `[start,end]` depth** (cheapest; extensible later to shot-counts/(x,y)).

17 - **Tiered turnaround:** slow human tier (authoritative) + fast automated tier (CI / "surprise regression"). ?? **Oracle rule:** the fast-tier auto-labeler MUST be a different model lineage than production, else shared blind spots ? false green.

18 - **Vendor bake-off**, favouring **Bangalore/India-local** (user is Bangalore-based). *(Superseded 2026-06-02 ? started as a single-vendor **Roora** pilot; see Status below.)*

19

20 **Architecture (partly built ? 2026-06-02):** the `AnnotationProvider` registry + `FileProvider` (GS-1), the `regress(video)` runner (GS-2 ? `backend/eval/regression.py` + `run\_regression.py`), and the `AutomatedProvider` oracle scaffold (GS-4) have **landed**. The vendor-dependent **`HumanVendorProvider` (GS-3)** is the remaining slice, parked until the Roora pilot confirms quality.

21

22 **Vendor leads (verified India presence + video; pricing NOT verified ? all quote-only):** primary = **iMerit** (Bengaluru office, sports domain, enterprise QA) and **Taskmonk** (Bengaluru, platform+service, likely cheaper/agile); heavyweight third = **TELUS/Playment** (Bangalore-founded CV). Excluded: **Karya** (Bengaluru but speech/text only, no video). Tier-2 leads + confidence labels in the doc. (PR #12.)

23

24 **Status (2026-06-02):**

25 - **Vendor selected for the initial pilot: Roora** (Roora ML Pvt Ltd, HSR Layout,

Bengaluru; `info@rooragrp.com`) ? site/capability (image/video/text annotation; sports industry) and location verified; **quality TBD via the pilot**. Run as a **single-vendor pilot first**, NOT a multi-vendor bake-off; iMerit/Taskmonk/TELUS are the fallback if it misses the quality bar.

```
26 - **Annotation guideline authored** (Step 0): collector repo `docs/annotation/` ?
`ROORA_BRIEF.md` (rally CSV schema:
`rally_number,start_time,end_time,shots_count,ending_reason`, mm:ss?seconds),
`ANNOTATION_GUIDE.md` (illustrated; three golden rules = ignore dead time / include EVERY rally
incl. service faults & lets / shot = one racket-paddle-bat contact; `ending_reason` =
forced/unforced-error taxonomy (`winner | forced_error | unforced_error | service_fault | let |
other`, shared across net-separated sports; superseded observational `into_net`/`out`
2026-06-06)); **singles & doubles** for badminton & pickleball), + intake-manifest & NDA
templates.
27 - **Pilot scope = 3 sports** (badminton, pickleball, table tennis), scaling to ~12?15
videos/sport. The **collector now ingests all three** via `import-local` (collector ADR-001
keeps explicit per-sport code over a registry; collector test coverage 87%).
28 - **Still pending:** the internal **gold key** (5?10 expert-labeled clips) and **GS-3
`HumanVendorProvider`**.
29

I'm fully ramped up, and yes ? I can pick up cleanly where the last incarnation left off. Here's the reconciliation of memory against reality:

? State confirmed (memory matches the repos)

****Indexer**** (`badminton-highlight-indexer`) ? `master` clean, in sync with origin. All WASB work landed:

- #21 substrate (`wasb\_infer.py`, `wasb\_runner.py`, `wasb\_hybrid`, `calibration.py`), #22 (GPU batch/workers), #23 (progress logging), #24 (recovered `calibrate\_wasb.py`). I verified `backend/eval/calibrate\_wasb.py` and the wasb files are all tracked on master.

****Collector**** (`sports-data-collector`) ? PR #9 `validate-delivery` is ****merged**** (resolves the one contradiction in the memory, which said both "merged" and "awaiting merge" ? it's merged).

****The first calibration result stands**** ? on 25 golden rallies: baseline F1 0.588 ? tuned (0.05, 1.0, 1.0) ****F1 0.746**** (+26.8%, optimistic) with honest 5-fold held-out recall 0.88 ± 0.16 and ****zero generalization gap****.

****Artifacts all survived**** (this is the important bit ? a reboot lost the inference once before):

- Trajectory CSV intact both sides: `~/clips/sample\_long\_traj.csv` (WSL) and `C:\?\Temp\sample\_long\_traj.csv` ? 21,284 frames.
- 21,284 extracted frames still in `Temp\sample\_long\_frames` (~4GB, deletable).
- Golden labels present at `Annotation Setup\golden\_labels\_badminton.csv`.

So nothing needs to be re-run to resume ? the expensive GPU pass output is cached.

?? Two small discrepancies to flag

1. ****Collector local checkout is stale**** ? it's sitting on the now-merged `feat/validate-delivery` branch (not `master`), with untracked `data/roora\_\*` + `data/validation/` files. Memory's "both repos clean, branches deleted" is true for the indexer but ****not**** locally for the collector. Easy cleanup when you next touch it.
2. ****Indexer has a stray open PR #11**** (KhelAcharya Shot Intelligence, from 2026-05-30). Per your `[[sibling-internship-repo]]` note that work belongs in the *separate* `badminton-highlight-indexer-khelacharya` repo ? so this looks like an orphaned PR worth closing.

Where you left off ? the open threads

Per the runbook, the WASB substrate + first calibration are done. The queued next steps are:

- **(A) Export tuned segments for eyeball** ? apply the tuned config to the cached trajectory, cut the rally clips, and you visually confirm "are the rallies actually better?" Cheapest, validates the +26.8% is real and not just a metric.
- **(B) Implement WASB-pass checkpointing** ? the item explicitly marked **"? TODO next session: IMPLEMENT NEXT SESSION"**: md5-keyed cache, incremental detector output flushed every ~1000 frames, cheap CPU-tracker re-run, atomic writes. So the next long video survives a reboot.
- **(C) Multi-agent tuning Workflow** ? the token-heavy parallel grid search over {variant × 3 thresholds × strategy} instead of the plain grid.
- **(D) 2nd labelled video ? honest cross-video precision** (``leave_one_video_out``) ? blocked on new annotation data (Roora re-delivery / bulk videos), so not actionable today.

Which thread do you want to resume?

17. user (2026-06-06T14:14:06.916Z)

Your questions have been answered: "Which thread should I pick up this session?"="Can you complete 4, 2, 1 first and then we take from there?". You can now continue with these answers in mind.

18. assistant (2026-06-06T14:14:32.811Z)

Got it ? order: **(4) repo cleanup** ? **(2) WASB checkpointing** ? **(1) export tuned segments**. That sequence makes sense: clean ground first, build the bigger checkpointing refactor, then the quick export to eyeball. Let me start.

19. user (2026-06-06T14:14:33.504Z)

Chapter marked: "Repo cleanup". Continue your current work.

20. assistant (2026-06-06T14:14:37.745Z)

Starting with task 4. Let me inspect PR #11 before touching it (don't close blind), and check the collector's exact state in parallel.

21. user (2026-06-06T14:14:40.081Z)

```
=== PR #11 detail ===

23. assistant (2026-06-06T14:15:03.729Z)

PR #11 is the KhelAcharya shot-intelligence scaffolding committed straight into the *main indexer repo* ? which contradicts the locked decision to keep that work in a separate repo. Before I close it, let me confirm the separate repo actually exists (so my closing comment is accurate, not fabricated), and check the collector's gitignore so I know the untracked `data/` files are safe to leave.

24. user (2026-06-06T14:15:06.366Z)

26. assistant (2026-06-06T14:15:30.052Z)

Important ? this changes the picture. The `badminton-highlight-indexer-khelacharya` local directory is **not a separate GitHub repo** ; it points at the *same* `avidullu/badminton-highlight-indexer` remote. So my assumption that PR #11 was "superseded by a separate repo" would be **false** if I asserted it. Let me read the actual decision memory and check whether the shot-intelligence work is on indexer master before I touch PR #11.

27. user (2026-06-06T14:15:31.019Z)

<system-reminder>This memory is 6 days old. Memories are point-in-time observations, not live state ? claims about code behavior or file:line citations may be outdated. Verify against current code before asserting as fact.</system-reminder>

```
1      ---
2      name: sibling-internship-repo
3      description: "A separate khelacharya repo builds a shot-intelligence layer ON TOP of
this project's rally segmentation ? keep them separate"
4      metadata:
5          node_type: memory
6          type: project
7          originSessionId: aa329f09-28b7-4acc-b062-98ec7e905abc
```

```

8      ---
9
10     There is a separate sibling repo at `C:\Users\avidu\Projects\badminton-highlight-
indexer-khelacharya\` (the user works across machines) holding an internship execution plan
? `docs/INTERNSHIP_KHELACHARYA_SHOT_INTELLIGENCE_EXECUTION_PLAN.md` (+ a recruiting-flyer
generator stub `scripts/generate_khelacharya_flyer.py`).
11
12     The boundary the user explicitly wants kept (2026-05-30): this project
(`badminton-highlight-indexer`) is the foundation ? reliable rally segmentation across
sports (badminton, pickleball, table-tennis, tennis). The intern's "KhelAcharya Shot
Intelligence Layer" builds on top: it takes each segmented rally and maps each shot within
it to actionable output (shot type, player attribution, outcome). Rally boundaries are the
contract between the two.
13
14     How to apply:
15     - Keep the repos separate. Don't bleed shot-level work into this repo; don't pull
this repo's churn into the internship plan.
16     - The intern plan deliberately reuses our patterns (`BasePlaySegmenter`-style
`BaseShotDetector`, the eval-harness `metrics.py` symmetry at shot granularity, `SportProfile`
registry, TrackNet/WASB outputs) and names our `feat/permissive-detector-swap` direction as a
principle ? so improvements to our substrate (segmentation quality, permissive licensing, multi-
sport profiles) directly enable the intern's layer.
17     - Document owner: Avi Dullu. This is forward-looking context, not active work in this
repo.
18

```

31. assistant (2026-06-06T14:16:35.012Z)

Collector is clean now (on `master`, merged branch deleted; the untracked `data/roora\_` files are local artifacts so I left them in place).

Now ? ****I need to correct course on PR #11 before touching it.**** What I found contradicts how I described it to you, so let me surface it rather than blindly close. Let me confirm one last fact: whether a separate GitHub repo actually exists.

32. user (2026-06-06T14:16:38.233Z)

```
=== does a separate khelacharya GitHub repo exist? ===
GraphQL: Could not resolve to a Repository with the name 'avidullu/badminton-highlight-indexer-khelacharya'. (repository)
=== all avidullu repos matching badminton/khel ===
avidullu/badminton-highlight-indexer      private 2026-06-06T12:35:11Z
```

33. assistant (2026-06-06T14:16:50.439Z)

Confirmed: ****there is no separate GitHub repo**** ? only `avidullu/badminton-highlight-indexer` exists. The `badminton-highlight-indexer-khelacharya` folder is just a second local clone of ***this same repo***, currently sitting on the `feat/khelacharya-shot-intelligence` branch (= PR #11).

?? Correction on PR #11 ? I was wrong to call it "orphaned"

When I proposed closing it, I assumed it was superseded by a separate repo. That's ****false****. Here's the real situation:

- PR #11 carries the ****KhelAcharya internship scaffolding****: `backend/shot\_intelligence/` (ShotEvent schema), `docs/SHOT\_TAXONOMY.md`, the 10?12 week execution plan doc, and the flyer generator. None of that is on `master` (only the flyer stub is).
- Your locked decision (`[[sibling-internship-repo]]`) is ****"keep the shot-level work separate from the rally-segmentation foundation; don't bleed it into this repo."****
- With only one GitHub repo, the way that separation is ***currently*** enforced is exactly this: the shot-intelligence work lives on the `feat/khelacharya-shot-intelligence` branch and is ****deliberately not merged to master****. PR #11 staying open-but-unmerged is arguably the correct state, not junk.

So closing PR #11 isn't "cleanup" ? it's a strategic call about the internship boundary. (Closing is reversible: the branch persists and the PR can be reopened, so nothing is lost either way.) I don't want to execute the close on a premise I now know was wrong. Your call:

34. user (2026-06-06T14:17:07.194Z)

Your questions have been answered: "Given there's only one GitHub repo (no separate khelacharya repo exists), what should happen to PR #11 (the internship shot-intelligence scaffolding)?"="Close, keep branch". You can now continue with these answers in mind.

35. assistant (2026-06-06T14:17:15.017Z)

Got it ? closing PR #11 with the branch retained. Let me do that with an accurate comment, then update the stale memory.

36. user (2026-06-06T14:17:22.607Z)

? Closed pull request avidullu/badminton-highlight-indexer#11 (feat: KhelAcharya Shot Intelligence Layer - Internship Execution Plan + Initial Scaffolding)

=== verify ===

```
{"headRefName":"feat/khelacharya-shot-intelligence","state":"CLOSED"}
```

=== branch still on remote? ===

```
8d29cb06eb12551b51367739afed05027e1ac3ca      refs/heads/feat/khelacharya-shot-intelligence
```

37. assistant (2026-06-06T14:17:29.204Z)

PR #11 is closed, branch retained on the remote. Now let me fix the stale memory that led me astray (it called this a "separate repo" when it's the same remote), and log the cleanup checkpoint.

38. user (2026-06-06T14:17:36.108Z)

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\sibling-internship-repo.md has been updated successfully. (file state is current in your context ? no need to Read it back)

39. user (2026-06-06T14:17:51.470Z)

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md has been updated successfully. (file state is current in your context ? no need to Read it back)

40. assistant (2026-06-06T14:18:13.560Z)

? **Task 4 (repo cleanup) complete.** Both repos clean on master; PR #11 closed with branch retained; stale memory corrected.

Now **task 2: WASB-pass checkpointing.** Let me mark the new chapter and read the actual code I'll be refactoring ? the design in memory is 6 days old, so I'll verify against current `wasb\_infer.py` before touching it.

41. user (2026-06-06T14:18:14.640Z)

Chapter marked: "WASB-pass checkpointing". Continue your current work.

42. user (2026-06-06T14:18:15.251Z)

```
1      """WASB shuttle-trajectory inference on an arbitrary frame sequence (runs in WSL).
2
3      WASB-SBDT only ships *dataset* evaluation; this is a thin wrapper that reuses its
4      own building blocks (ImageDataset transform + detector + online tracker) to run on
5      any folder of extracted frames and emit a trajectory CSV in the exact shape the
6      indexer's `tracknet_runner.parse_trajectory_csv` already consumes:
7
8          Frame,Visibility,X,Y
9
10     It must run INSIDE the WSL `wasb` conda env, from the WASB-SBDT `src/` dir (it
11     imports WASB's `detectors`/`trackers`/`dataloaders`). The Windows-side adapter
12     (`wasb_runner.py`) stages this file + the frames into WSL and invokes it.
13
14     Usage (in WSL, from ~/models/WASB-SBDT/src):
15         python wasb_infer.py --frames_dir /path/frames --weights
16         ../pretrained_weights/wasb_badminton_best.pth.tar \
17         --out /path/traj.csv [--sport badminton] [--limit N]
```

1     """WASB shuttle-trajectory runner (WSL2 subprocess adapter).
2
3     Windows-side counterpart to backend/detectors/wasb_infer.py. It:
4         1. stages the video into the WSL filesystem (fast local reads, not /mnt),
5         2. copies wasb_infer.py into the WASB repo's src/ dir,
6         3. runs it in the WSL `wasb` conda env -> a Frame,Visibility,X,Y trajectory CSV,
7         4. reuses the (model-agnostic) trajectory->action-window logic from tracknet_runner.
8
9     So the only WASB-specific bits live here; the windowing + CSV parsing are shared
10    with the TrackNet path. Verified inference core: wasb_infer.py (see its docstring).

44. assistant (2026-06-06T14:19:23.779Z)

`wasb\_infer.py` is clear. The key structural fact: the GPU loop accumulates
`det\_results[frame\_path]` (a list of detection candidates per frame ? a frame gets detections
from *every* overlapping window), then the cheap tracker loop consumes that. So the correct
checkpoint unit is the window, and to resume I must replay cached windows to rebuild the
accumulation exactly.

Two things I must verify before writing serialization: (1) the exact structure of each detection
object `batch\_results[ib][ie]` returns (so JSON round-trips correctly), and (2) how `wasb\_infer`
is currently tested. Let me inspect the WASB detector source in WSL and the existing tests +
runner in parallel.

47. assistant (2026-06-06T14:19:37.549Z)

I see deepball, but WASB uses `detector.py` (TracknetV2Detector). Let me read its exact `run\_tensor` return shape and the tracker's `update` input, so I serialize the right thing.

48. user (2026-06-06T14:19:39.314Z)

```

49. assistant (2026-06-06T14:19:50.991Z)

The detection structure is clear: `run\_tensor` returns `results[bid][eid]` = a **list of dicts** `{'xy': np.array([x,y]), 'score': <float>, 'scale': <int>}`. That's what accumulates per frame and feeds `tracker.update`. Let me confirm the tracker's expected input type for `xy` (numpy vs list) so my JSON round-trip reconstructs it correctly.

51. assistant (2026-06-06T14:20:05.806Z)

The tracker is the deciding constraint: `online.py` does `det['xy'] - self.\_track.xy(...)` and `np.linalg.norm(det['xy'] - ...)` , so `xy` must be reconstructed as a numpy array** on replay (not a list). It's also stateful across frames (`self.\_fid`), which confirms why the tracker can't resume mid-stream but *is* deterministic when re-run over the full ordered cache. Let me read the full `online.py` to confirm `update`/`refresh` and frame-id handling.

```

53. assistant (2026-06-06T14:21:17.443Z)

Now I have the complete contract. The tracker increments an internal sequential `\_fid` per `update` call ? so it requires every frame fed in contiguous order, which makes the tracker re-run fully deterministic over the cached detector outputs. That validates the decoupling.

Before writing, let me confirm the test setup (pytest, numpy availability, package importability) so my cache layer is unit-testable on Windows without torch/CUDA.

```

56. assistant (2026-06-06T14:23:41.563Z)

Everything's confirmed: numpy 2.4.6 available, pytest with 171 tests, `backend.detectors` importable, and `wasb\_infer.py`'s heavy imports are all inside `run()` so the module imports safely on Windows for unit testing.

I now have the complete design. The checkpoint unit must be the **window** (since a frame accumulates detections across overlapping windows), the cache stores plain `[x,y,score,scale]` (reconstructed to `np.array` only at tracker-feed), and the tracker re-run is deterministic over the full ordered cache. Let me write the refactored `wasb\_infer.py`.

57. assistant (2026-06-06T14:24:42.516Z)

```

"""WASB shuttle-trajectory inference on an arbitrary frame sequence (runs in WSL).

```

WASB-SBDT only ships *dataset* evaluation; this is a thin wrapper that reuses its own building blocks (ImageDataset transform + detector + online tracker) to run on any folder of extracted frames and emit a trajectory CSV in the exact shape the indexer's `tracknet\_runner.parse\_trajectory\_csv` already consumes:

```

Frame,Visibility,X,Y

```

It must run INSIDE the WSL `wasb` conda env, from the WASB-SBDT `src/` dir (it imports WASB's `detectors`/`trackers`/`dataloaders`). The Windows-side adapter (`wasb\_runner.py`) stages this file + the frames into WSL and invokes it.

Resumable across reboots

The GPU detector pass (one forward per sliding window ? ~21k for a 6-min clip) is the slow, expensive part; the CPU tracker pass that turns detections into a trajectory is cheap and **stateful** (it must see every frame in order, so it can't resume mid-stream). We exploit that split:

- * The detector pass writes its per-window raw outputs incrementally to ``<cache>/det\_raw.jsonl`` (flushed+fsync'd every ``--flush-every`` windows) and records progress in ``<cache>/manifest.json`` (atomic write). A reboot loses at most ``--flush-every`` windows of GPU work instead of the whole pass.
- * On restart we replay the cached windows, skip the DataLoader ahead to the first un-cached window, and continue. Once every window is cached, the detector pass is skipped entirely and we just re-run the (cheap, deterministic) tracker over the full ordered cache -> trajectory CSV. So a lost trajectory CSV costs seconds, not the GPU hour.

The cache is keyed by the output path (``<out>\_wasbcache/`` by default), lives next to the output (NOT in %TEMP%), and is invalidated automatically if the frames dir, weights, sport, window size, or frame count change.

Usage (in WSL, from ~/models/WASB-SBDT/src):

```
python wasb_infer.py --frames_dir /path/frames --weights
../pretrained_weights/wasb_badminton_best.pth.tar \
    --out /path/traj.csv [--sport badminton] [--limit N] [--cache-dir DIR] [--flush-every
1000] [--fresh]
"""

The file C:\Users\avidu\Projects\badminton-highlight-indexer\backend\detectors\wasb_infer.py has been updated successfully. (file state is current in your context ? no need to Read it back)

59. user (2026-06-06T14:25:39.673Z)

File created successfully at: C:\Users\avidu\Projects\badminton-highlight-indexer\tests\test_wasb_cache.py (file state is current in your context ? no need to Read it back)

60. assistant (2026-06-06T14:25:11.609Z)

Now the unit tests for the cache layer ? these run on Windows without torch/CUDA by exercising the pure-Python cache functions and the numpy reconstruction directly.

61. assistant (2026-06-06T14:25:39.653Z)

"""Resumable-cache layer of wasb_infer (pure-Python parts; no WSL/GPU).

Covers the reboot-resume guarantees: per-window incremental cache, cross-window detection accumulation on replay, crash-truncation recovery, manifest compatibility/invalidation, and atomic trajectory writes.

62. assistant (2026-06-06T14:25:43.694Z)

Let me run the new cache tests, then the full suite to confirm no regressions.

63. user (2026-06-06T14:25:45.620Z)

```

..... [100%]
11 passed in 0.27s

```

64. assistant (2026-06-06T14:25:48.956Z)

All 11 cache tests green. Now the full suite for regressions.

65. user (2026-06-06T14:25:58.125Z)

```

..... [ 39%]
..... [ 79%]
..... [100%]
182 passed in 6.99s

```

66. assistant (2026-06-06T14:26:35.953Z)

182 passed (171 + 11 new), no regressions.

The refactor changed the core inference loop, so I need to validate it on the real GPU in WSL ? not just unit tests. I'll do a deterministic ****resume-equivalence**** check: a fresh full run, then truncate the detector cache to simulate a mid-run crash, re-run, and confirm the resumed trajectory is byte-identical to the non-resumed one. First, stage the updated script into WSL and smoke-test on a small frame subset.

67. user (2026-06-06T14:27:00.161Z)

68. assistant (2026-06-06T14:27:13.664Z)

Smoke test passes (298 windows @ 27 win/s, 122/300 visible). Now the validation that matters. Let me check the cache contents, then run two equivalence checks: (B) ****tracker-only re-run**** (cache complete) and (C) ****incremental resume**** (truncate cache to simulate a crash) ? both must reproduce the full trajectory byte-for-byte.

69. user (2026-06-06T14:27:19.913Z)

70. assistant (2026-06-06T14:27:32.944Z)

Cache layout is correct (298 window lines, valid manifest), and the ****tracker-only re-run is byte-identical**** to the full run ? proving the "lost CSV but intact detector cache = instant recovery" path. Now the critical one: simulate a mid-run crash by truncating the cache, then confirm the ****incremental resume**** reproduces the exact trajectory.

71. user (2026-06-06T14:28:04.430Z)

```

72. assistant (2026-06-06T14:29:17.394Z)

****Validation complete ? and it surfaced an honest, important detail.** Results:**

- ****(A)**** Cache layout correct: 298 window lines, valid manifest.
- ****(B)**** tracker-only re-run** (cache complete, CSV lost): ****byte-identical**** to the full run. This is the exact reboot scenario that bit you before ? now recovers in ~1s instead of an hour.
- ****(C)**** incremental resume** (cache truncated to 150/298, CSV deleted): resumes from 150, completes, and the trajectory matches the full run ****except 3 of 300 rows differing by 76x10?? pixels, with identical visibility****. That residual is ***GPU floating-point non-determinism*** ? the resumed pass re-batches the remaining windows differently, and cuDNN conv/softmax reductions aren't bit-stable across batch boundaries. It is ****not**** a checkpointing bug (two fresh full runs would differ the same way); the resume logic itself replays the cache exactly. Sub-thousandth-of-a-pixel is utterly negligible for rally-velocity thresholds.
- ****(D)**** cache invalidation**: changing `--limit` (? different frame count) correctly triggers "cache incompatible ? starting fresh."

Let me clean up the WSL test artifacts and commit this on a branch.

73. user (2026-06-06T14:29:20.136Z)

```
cleaned WSL test artifacts
batch_test.csv
sample_long_traj.csv
wasb_traj_test.csv
=== ensure real trajectory still intact ===
-rw-r--r-- 1 avidullu avidullu 600480 Jun  6 12:31 /home/avidullu/clips/sample_long_traj.csv
```

74. assistant (2026-06-06T14:29:34.416Z)

Real trajectory intact. Now branch, commit, and open the PR (matching this repo's small-PR cadence).

75. user (2026-06-06T14:29:46.196Z)

```

78. assistant (2026-06-06T14:30:24.679Z)

****Task 2 complete**** ? [PR #25](https://github.com/avidullu/badminton-highlight-indexer/pull/25) opened. The reboot data-loss bug is fixed: detector pass is now resumable, tracker decoupled, validated end-to-end in WSL. Let me log the checkpoint.

79. user (2026-06-06T14:30:31.391Z)

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md has been updated successfully. (file state is current in your context ? no need to Read it back)

80. assistant (2026-06-06T14:30:56.269Z)

****Now task 1: export tuned segments for eyeball verification.**** This should reuse the existing windowing (`calibrate_wasb.make_predict_fn`) and the rally slicer (#20). Let me read both to build on them rather than duplicate.

81. user (2026-06-06T14:30:57.207Z)

Chapter marked: "Export tuned segments". Continue your current work.

82. user (2026-06-06T14:30:58.154Z)

```
1      """Per-video calibration driver: WASB trajectory + golden rallies -> tuned thresholds +
"+X%".
2
3      Wires the already-tested pieces together:
4          WASB trajectory CSV (Frame,Visibility,X,Y)
5          -> TrackNetRunner.trajectory_to_action_windows(cfg)    [predict_fn]
6          -> backend.eval.calibration (improvement_report / cross_validate)
7
8      Run (after a full-video WASB pass exists):
9          python -m backend.eval.calibrate_wasb --trajectory full_traj.csv \
10             --labels "golden_labels_badminton.csv" --fps 59.94 --frame-width 1920
11
12      Honesty note: the grid is *selected* on the full GT, so `improvement_report` on that
13      same GT is an **optimistic** upper bound. The trustworthy number is the
14      cross-validated held-out **recall** (and, once a 2nd labelled video exists,
15      `leave_one_video_out` for precision/F1 generalization).
16      """

1    """Slice individual rally clips out of a (long) annotated video.
2
3    Use cases:
4    - **Offline verification** ? pull rally N out of a 30-min match to eyeball its
5      boundaries against the labels.
6    - **Per-video calibration/training** ? grab a handful of labeled rallies as the
7      supervision the segmenter is tuned/adapted on for that specific video.
8
9    Given a labels CSV (the golden `rally_number,start_time,end_time[,start_mmss,
10   end_mmss]` shape) and a set of rally numbers, it writes one padded clip per rally:
11       <out_dir>/<video_stem>__rally_<n>.mp4
12
13   Padding matches the highlight compiler (begin 0.5 s / end 1.0 s) so a sliced clip
14   shows the same lead-in/out the model is trained and evaluated against. The window
15   math (`compute_clip_windows`) is pure and unit-tested; ffmpeg is only touched in
16   `slice_rallies`.

```

85. assistant (2026-06-06T14:31:23.394Z)

Both pieces are reusable: `make\_predict\_fn` produces segments from the trajectory, and `rally\_slicer.slice\_rallies` cuts clips from a golden-schema CSV ? so if I export tuned segments *in that schema*, they feed straight into the slicer. Let me check `metrics.py` (for IoU matching in the comparison) and `annotations.py` (for a seconds?mm:ss formatter) so I reuse those too.

86. user (2026-06-06T14:31:24.335Z)

87. assistant (2026-06-06T14:32:36.253Z)

Everything I need is reusable: `metrics.py` gives me IoU matching (`match\_intervals`/`score`), `calibrate\_wasb` gives the windowing + golden loader, and `rally\_slicer` cuts clips from a golden-schema CSV. So the export driver writes tuned segments *in that schema* ? usable for scrubbing, comparison, and direct slicing. Let me write it.

88. assistant (2026-06-06T14:33:03.993Z)

```

"""Export tuned WASB rally segments for manual eyeball verification.

```

After calibration picks a tuned threshold config, this turns a cached WASB trajectory into the actual rally [start,end] segments that config produces, so the user can answer "are the rallies actually better?" ? by scrubbing the video to each segment, by diffing tuned-vs-golden quantitatively, or by cutting clips.

Reuses (no new windowing/metrics/cutting logic):

- calibrate_wasb.make_predict_fn -> trajectory -> segments for a given config
- eval.metrics.match_intervals/score -> tuned-vs-golden IoU comparison
- tools.rally_slicer.slice_rallies -> optional clip cutting (the exported CSV is written in the golden/slicer schema, so it feeds straight back in)

Run (uses the tuned config from the first calibration by default):

```

python -m backend.eval.export_wasb_segments --trajectory ~/clips/sample_long_traj.csv \
    --labels "Annotation Setup/golden_labels_badminton.csv" --fps 59.94 --frame-width 1920
# add --video <mp4> --slice to also cut one padded clip per tuned rally

```

```

"""

```

```

from __future__ import annotations

```

```

import csv
import os
import os.path as osp
import argparse
from typing import List, Tuple, Dict, Optional

```

```

from backend.eval.calibrate_wasb import make_predict_fn, load_golden_gts, BASELINE

```

..... [100%]
5 passed in 0.10s

```

95. assistant (2026-06-06T14:33:57.400Z)

All 5 pass. Now let me run the export on the **real** trajectory + golden labels ? this is the actual deliverable for the user to eyeball (pure Python, no GPU needed).

96. user (2026-06-06T14:33:59.172Z)

```

=== WASB tuned-segment export ===
tuned cfg (0.05, 1.0, 1.0): 34 rally segments, 151.9s of play -> output/wasb_tuned_segments.csv
baseline cfg (0.02, 2.0, 2.0): 26 segments -> output/wasb_tuned_segments_baseline.csv

--- tuned vs golden (25 rallies, IoU>=0.5) ---
matched (TP) 22 | misses (FN) 3 | extra (FP) 12
precision 0.647 | recall 0.880 | f1 0.746 | meanIoU 0.753
mean boundary error: start 0.64s | end 0.91s
per-rally detail -> output/wasb_tuned_segments_vs_golden.csv

```

97. assistant (2026-06-06T14:34:12.377Z)

The export reproduces the calibration numbers exactly (F1 0.746, recall 0.880, precision 0.647 ? matching the recorded +12.2% precision / +26.8% F1), and produces the per-rally eyeball artifact. Let me surface the misses and false-positives with timestamps so you know exactly

where to scrub.

98. user (2026-06-06T14:34:13.060Z)

```

103. assistant (2026-06-06T14:35:18.773Z)

That's expected ? switching to `master` to branch task 1 reverted the working tree's `wasb\_infer.py` to master's original; my checkpointing changes are safely committed on the `feat/wasb-checkpointing` branch (PR #25). The two PRs are independent (different files, no conflict). Now let me open the PR for task 1.

104. user (2026-06-06T14:35:27.866Z)

<https://github.com/avidullu/badminton-highlight-indexer/pull/26>

105. assistant (2026-06-06T14:35:52.010Z)

Both PRs are up. Let me record the checkpoint in memory and return the repo to `master`.

106. user (2026-06-06T14:36:02.547Z)

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md has been updated successfully. (file state is current in your context ? no need to Read it back)

107. user (2026-06-06T14:36:09.295Z)

```
Switched to branch 'master'

116. assistant (2026-06-06T14:37:17.310Z)

All three tasks are done. Here's the wrap-up.

? What landed this session

****(4) Repo cleanup****

- Collector was stranded on the merged `feat/validate-delivery` branch ? synced to `master`, merged branch deleted. Both repos genuinely clean now.
- ****PR #11 closed (branch kept).**** Mid-task I caught that my "orphaned, superseded by separate repo" framing was **wrong** ? there is no separate khelacharya GitHub repo; that folder is a second clone of this same repo, and PR #11 was the deliberate way shot-intelligence work is kept off `master`. I surfaced that, you chose "close, keep branch," and I fixed the stale memory that misled me.

****(2) WASB-pass checkpointing ? [PR #25](https://github.com/avidullu/badminton-highlight-indexer/pull/25) (merged, now on master)****

- The reboot-loses-everything bug is fixed. Detector outputs cache per-window to ``<out>_wasbcache/det_raw.jsonl` (fsync'd every 1000 windows) + atomic manifest; resume skips ahead to the first un-cached window; the stateful tracker is decoupled and re-run over the full ordered cache. A lost trajectory CSV now recovers in seconds.`
- WSL-validated: tracker-only re-run ****byte-identical****; incremental resume matches the full run except 3/300 rows by $76 \times 10^{??}$ px (inherent cuDNN noise, not a bug). 11 new tests.

****(1) Export tuned segments ? [PR #26](https://github.com/avidullu/badminton-highlight-indexer/pull/26) (open)****

- New ``export_wasb_segments.py`` reuses the windowing, metrics, and rally slicer. Ran on the ****real**** trajectory + golden labels. 5 new tests; suite 187 green.

? What to eyeball (the actual deliverable)

Artifacts in `output/` (gitignored): `wasb\_tuned\_segments.csv`, `\_baseline.csv`, and the per-rally `wasb\_tuned\_segments\_vs\_golden.csv`.

****Tuned vs 25 golden rallies:**** 22 matched, 3 "missed", 12 "extra" ? precision 0.647 · recall 0.880 · ****F1 0.746**** (exactly reproduces the calibration). Honest read: recall is strong and boundaries are mostly <1s, but precision shows the tuned config ****over-segments****. Several "errors" are artifacts, not hallucinations:

- ****Fragmentation:**** golden rally 3 (`0:44.5?0:51.1`) got split into two pieces (`44.8?46.9` + `48.4?50.8`), so it counts as 1 miss ****** + 2 false positives from one real rally******. That's a `merge\_gap` symptom.
- ****Boundary too long:**** golden 8 (`1:58.1`, a 1.5s rally) detected as `118.1?123.0` ? 1 miss + 1 FP.
- ****Short rally dropped:**** golden 7 (`1:35.6?1:38.0`, 2.4s).
- ****Boundary overruns to spot-check:**** rally 1 starts 6.2s late, rally 21 ends 4.8s long, rally 23 ends 3.0s long.
- ****~9 genuine extras to watch:**** `0:03.4`, `0:36.9`, `0:53.9`, `1:00.5`, `1:19.5`, `1:47.2`, `2:24.5`, `3:08.2`, `5:39.1` ? could be warm-up, between-point motion, or real unlabeled rallies.

If you want clips instead of scrubbing: `python -m backend.eval.export\_wasb\_segments --trajectory <traj> --video <mp4> --slice` cuts one padded clip per tuned rally.

Open threads / your call

1. ****Merge PR #26**** when you're happy with it.
2. ****Eyeball verdict**** ? after watching, the levers for better precision are: raise `merge\_gap` (fixes the fragmentation), revisit `min\_window\_duration` (the dropped short rallies). The ***real*** precision verdict still needs a ****2nd labelled video**** (`leave\_one\_video\_out`).

Memory/handoff updated throughout. Want me to take a pass at a `merge\_gap` sweep to attack the fragmentation, or leave it until you've eyeballed?

117. user (2026-06-06T14:37:20.754Z)

PR #25 merged.

118. assistant (2026-06-06T14:37:35.933Z)

Already synced ? local `master` has the checkpointing changes. Let me do the post-merge branch cleanup that matches this repo's convention.

119. user (2026-06-06T14:37:42.410Z)

```
- [deleted]          (none)      -> origin/fix/recover-calibrate-wasb-driver

```

122. assistant (2026-06-06T14:38:36.075Z)

Both PRs merged, local `master` synced (now has #25 + #26), and the two branches from this session's work are cleaned up on both sides. I kept `feat/khelacharya-shot-intelligence` (the PR #11 branch you asked to retain). Let me update the memory and flag one optional cleanup item.

123. user (2026-06-06T14:38:44.474Z)

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md has been updated successfully. (file state is current in your context ? no need to Read it back)

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md has been updated successfully. (file state is current in your context ? no need to Read it back)

126. assistant (2026-06-06T14:39:09.079Z)

All wrapped up. ?

Session complete ? both PRs merged, tree clean

```

| Task | Result |
|---|---|
| *(4) Repo cleanup* | Collector synced to master; PR #11 closed (branch kept) after I corrected my wrong "separate repo" assumption; stale memory fixed |
| *(2) WASB checkpointing* | [PR #25](https://github.com/avidullu/badminton-highlight-indexer/pull/25) ? merged ? resumable detector pass, WSL-validated |
| *(1) Export tuned segments* | [PR #26](https://github.com/avidullu/badminton-highlight-indexer/pull/26) ? merged ? export driver + real eyeball artifacts |

```

Local `master` is at `7cca6b0` with both changes, clean and in sync. Session branches deleted on both sides; I kept `feat/khelacharya-shot-intelligence` as you asked. Suite is 187 green.

****One optional housekeeping note:**** two older **merged** branches ? `feat/rally-slicer` (#20) and `feat/wasb-substrate` (#21) ? are still sitting on `origin`. They're harmless (everything's on master), but I left them alone deliberately: deleting the `feat/wasb-substrate` branch is exactly what lost the `calibrate\_wasb` driver last time (needed PR #24 to recover). Say the word and I'll prune them.

****Your move now:**** eyeball `output/wasb\_tuned\_segments\_vs\_golden.csv` (or cut clips with `--video <mp4> --slice`). The honest read remains: strong recall (0.88), tight-ish boundaries, but the config over-segments ? most of the precision hit is fragmentation (rally 3 split in two) and a couple of short rallies dropped. Once you've looked, I can do a targeted `merge\_gap` sweep to attack the fragmentation, or we wait for a 2nd labelled video for the real cross-video precision number. Just tell me which.

127. user (2026-06-06T14:39:10.834Z)

cleanup feat/khelacharya-shot-intelligence as well.

128. assistant (2026-06-06T14:39:47.101Z)

Before I delete that one, let me check something ? when we closed PR #11 you chose to **keep** this branch, and it holds the KhelAcharya scaffolding that is ****not**** on `master`. Deleting an unmerged remote branch is effectively permanent (the commits get garbage-collected). Let me verify what's actually at risk before I act.

129. user (2026-06-06T14:39:49.240Z)

8d32b85 feat: add KhelAcharya Shot Intelligence Layer internship execution plan and initial scaffolding
f2ad8cd docs: golden-set generation + vendor process (v1), recording guidelines, ADR-006
Shell cwd was reset to C:\Users\avidu\Projects\badminton-highlight-indexer
```

130. assistant (2026-06-06T14:40:23.089Z)

The branch is ****not on master****, and its diff is mostly deletions (it rewrites README/ROADMAP off an old base) plus the unique `backend/shot\_intelligence/` stubs + internship docs. The key safety question: is that unique work preserved anywhere, since the remote tip (`8d29cb0`) differs from your local khelacharya clone (`8d32b85`)? Let me confirm the trees match before deleting.

131. user (2026-06-06T14:40:26.168Z)

132. assistant (2026-06-06T14:40:54.053Z)

The trees ****differ**** (``685e2ef`` remote vs ``c5536db`` local clone) ? so your local khelacharya clone is ***not*** a byte-identical backup of the remote branch. The core scaffolding files (``backend/shot_intelligence/``, the taxonomy + execution-plan docs) do exist in the local clone, but anything unique to the remote commit ``8d29cb0`` (e.g. its README/ROADMAP rewrite) would be gone for good, since it's unmerged and deleted-branch commits get garbage-collected.

That's new info you didn't have when you said "delete it," and it reverses the keep-decision from closing PR #11 ? so let me confirm how you want it gone rather than guess:

133. user (2026-06-06T14:41:04.669Z)

Your questions have been answered: "How should I clean up the unmerged feat/khelacharya-shot-intelligence branch (its exact commit isn't fully backed up locally)?"="Leave it". You can now continue with these answers in mind.

134. assistant (2026-06-06T14:41:16.991Z)

Got it ? leaving ``feat/khelacharya-shot-intelligence`` as-is. Good call given it's unmerged and not fully backed up locally; nothing's lost and we can always archive-and-delete later if the internship track is officially shelved.

Net state: ``master`` clean with #25 + #26 merged, session branches pruned, and the khelacharya branch retained (consistent with the PR #11 decision). The only remaining loose ends are the two older merged stragglers (``feat/rally-slicer``, ``feat/wasb-substrate``) which I'll leave untouched unless you want them pruned.

Nothing else queued. Whenever you've eyeballed the tuned segments, I'm ready to do the ``merge_gap`` sweep to attack the fragmentation ? or wait for a 2nd labelled video for the real cross-video precision number.

135. user (2026-06-06T14:45:19.584Z)

Can we do a demo run of this tool with the WASB weights you newly checked in for a video which I will provide right now? Can the highlights detector write a csv and not run the stitcher step whereby it finds the stitch segments and outputs them as csv and then I will eyeball that video and do some observations. Can you make a plan and have me take a look before running, no markdown just text here for a verbal approval

136. assistant (2026-06-06T14:46:02.726Z)

Good call to plan first. Let me ground the plan in the actual code (read-only) so the steps and commands are real, not guesses ? then I'll lay it out in plain text for your approval.

1      """WASB-based hybrid play segmenter.
2
3      Identical three-phase shape to TrackNetHybridSegmenter, but Phase 2 uses **WASB**
4      (nttcom/WASB-SBDT, MIT) shuttle-trajectory detection via WSL2
5      (backend/detectors/wasb_runner.py) instead of TrackNetV4. WASB ships pretrained
6      badminton weights and runs today, so this is the live shuttle-motion substrate.
7      Phase 3 (AI semantic boundaries) and Phase 4 (DB) are shared with the other hybrids.
8
9      For the per-video *calibration* goal we mainly use Phase 2 (trajectory -> candidate
10     windows); the windowing thresholds (velocity_thresh / merge_gap / min_window_duration)
```

```

11     are what get tuned against golden rally labels.
12     """

142. assistant (2026-06-06T14:47:31.756Z)

Read the real pipeline. One correction up front so we're aligned: I didn't check in any WASB weights this session ? I checked in code (the resumable inference + the segment exporter). The actual weights are the pretrained wasb_badminton_best.pth.tar already sitting in WSL at ~/models/WASB-SBDT/pretrained_weights/. The demo will use those. Also worth knowing: the full wasb_hybrid segmenter's later phase hands each candidate rally to Gemini, which is the dead free-tier path we deliberately abandoned ? so for this demo I'll run the shuttle-trajectory ? windowing path directly (no AI, no stitcher), which is exactly the "segments as CSV" you're describing.

Here is the plan, plain text:

Inputs I need from you: the absolute path to the video file. That's it.

Step 0 ? probe the video. I run ffprobe to read fps, frame width, duration, and frame count. These matter: the windowing normalizes shuttle velocity by frame width, and the segment times come from fps. I will NOT assume 60fps/1920 (those were the previous video's numbers). I'll report the probe back to you and a rough time estimate before the heavy step.

Step 1 ? extract frames (fast path). I extract frames to JPGs in a temp folder using Windows ffmpeg (the proven fast route; the in-tool cv2 extractor is ~10x slower). Roughly 4GB and a few minutes for a ~6-minute clip; less for a shorter one. Deletable afterward.

Step 2 ? WASB shuttle inference in WSL. I re-stage the current wasb_infer.py into the WSL WASB repo, activate the wasb conda env, and run inference over the frames with the pretrained badminton weights. Output is a trajectory CSV with columns Frame,Visibility,X,Y. This is the slow GPU step, but it now checkpoints ? if anything interrupts it, re-running resumes instead of starting over. Expected throughput is about 27 windows/sec on this box, so I'll give you a concrete ETA after Step 0.

Step 3 ? turn the trajectory into rally segments (no stitch, no AI). I run the exporter on the trajectory to produce the segment CSV: rally_number, start_time, end_time, duration, plus start/end as mm:ss so you can scrub directly. I'll generate two versions for comparison ? one with the baseline thresholds (0.02 / 2.0 / 2.0) and one with the tuned thresholds (0.05 / 1.0 / 1.0) from the earlier calibration. Caveat I want to flag honestly: those tuned thresholds were fit on a different video (static-camera Sample Long Video), so on your new clip they're a

starting point, not a guarantee ? eyeballing both tells us whether they transfer.

Step 4 ? hand off. I give you the CSV path(s) and a short summary (segment count, total seconds of play). No video gets stitched or written. You eyeball the source video against the timestamps and note observations.

What I will NOT do: no Gemini/AI handoff, no stitcher/compiler, no database writes, no committing the trajectory or frames (artifacts stay local/gitignored).

Two quick choices for you, or just say "go with defaults":

- Config: both baseline and tuned (my default), or only one.
- Frame coords: the CSV uses time only (seconds + mm:ss); say if you also want per-rally peak/mean shuttle velocity columns to help judge borderline segments.

Drop the video path and your go-ahead and I'll start with the probe.

143. user (2026-06-06T14:50:44.875Z)

for config, we should have two runs, one with the baseline and one tuned and first run the tuned so I can eyeball and get some anchor on quality. MM:SS is fine because you enabled time overlay in my vlc last time.

144. assistant (2026-06-06T14:51:09.120Z)

Got it ? tuned first for your quality anchor, then baseline; mm:ss it is (and yes, the VLC time-overlay Lua interface is still set up from last time). Since the GPU inference is config-independent, it runs once and both segment CSVs are instant post-processing on the same trajectory ? so I'll do the inference, hand you the tuned CSV to eyeball, and hold the baseline CSV until you've anchored and shared observations.

One thing missing though: you didn't include the video path. Drop the absolute path to the file and I'll kick off with the ffprobe probe (and give you the ETA before the heavy step).

145. user (2026-06-06T14:51:10.642Z)

"C:\Users\avidu\Projects\Annotation Setup\Collect\Adarsh and Vasanth.MP4"

```

148. assistant (2026-06-06T14:52:10.680Z)

Probe results ? your stress-test instinct is right, this is a beefier clip than last time:

- **1920×1080, 59.94 fps, 40,536 frames, 11m16s, 5.49 GB**

That's ~1.9× the Sample Long Video. Rough ETA: frame extraction ~7 min (~8 GB of JPGs), GPU inference ~25 min at the ~27 win/s we measured. The checkpointing rides along for free ? if the long pass dies (reboot/OOM/anything), re-running resumes from the last flush instead of

restarting, which is exactly the real-world checkpoint test you want.

Let me do the prep checks (disk headroom, GPU env, stage the current script) before committing to the heavy steps.

149. user (2026-06-06T14:52:18.394Z)

```

```

150. assistant (2026-06-06T14:52:53.061Z)

Prep is green: RTX 2070 Super sees CUDA, script staged with checkpointing, weights present. Disk is the one caution ? **32 GB free (96% used)**; the ~8 GB of frames fit, and they're deletable right after, but it's tight so I'll keep an eye on it.

Proceeding with the stress test. Starting frame extraction in the background (?7 min) ? I'll verify the frame count before launching the GPU pass.

151. user (2026-06-06T14:52:54.698Z)

Command running in background with ID: b2te8l5fk. Output is being written to:
C:\Users\avidu\AppData\Local\Temp\claude\C--Users-avidu-Projects-badminton-highlight-indexer\42211f80-2169-4025-ad9d-99c1aa29ff70\tasks\b2te8l5fk.output. You will be notified when it completes. To check interim output, use Read on that file path.

152. assistant (2026-06-06T14:53:02.882Z)

Frame extraction is running in the background (job `b2te8l5fk`). I'll verify the frame count when it finishes (~7 min), then launch the GPU inference pass ? also backgrounded, since at ~25 min it's well past a foreground timeout, and that's the run the checkpointing protects.

I'll report back the moment extraction completes. Nothing for you to do yet.

153. user (2026-06-06T15:01:08.990Z)

```

```

154. assistant (2026-06-06T15:01:24.892Z)

Extraction finished (exit 0). Let me verify the frame count and disk headroom before the GPU pass.

155. user (2026-06-06T15:01:47.228Z)

```
=== extraction output ===
EXTRACTION_DONE
```

```
=== frame count (expect ~40536) ===
40536
=== frames dir size + disk free ===
7.9G   C:/Users/avidu/AppData/Local/Temp/adarsh_frames
C:      746G  557G  189G  75% /c
```

156. assistant (2026-06-06T15:02:00.987Z)

All ****40,536 frames**** extracted cleanly (7.9 GB), and disk freed up nicely ? ****189 GB free**** now, no pressure.

Launching the GPU inference pass in the background with the checkpointing active (flushing every 500 windows, so a crash costs <20 s of GPU). The trajectory writes to `~/clips/adarsh\_traj.csv`; the resumable cache lands in `~/clips/adarsh\_traj\_wasbcache/`.

157. user (2026-06-06T15:02:02.590Z)

Command running in background with ID: b99pdx6kl. Output is being written to:
C:\Users\avidu\AppData\Local\Temp\claude\C--Users-avidu-Projects-badminton-highlight-indexer\42211f80-2169-4025-ad9d-99c1aa29ff70\tasks\b99pdx6kl.output. You will be notified when it completes. To check interim output, use Read on that file path.

158. assistant (2026-06-06T15:02:15.193Z)

Inference is running in the background (job `b99pdx6kl`, ?25 min). Let me peek once to confirm it spun up cleanly on the GPU rather than erroring on startup.

159. user (2026-06-06T15:02:16.009Z)

<system-reminder>Warning: the file exists but is shorter than the provided offset (1). The file has 1 lines.</system-reminder>

160. user (2026-06-06T15:02:29.568Z)

```
[wasb_infer] detecting on 40534 remaining windows (total 40534, batch=8, workers=4)...
---
65 %, 5461 MiB
```

161. assistant (2026-06-06T15:02:56.964Z)

Confirmed healthy: it's processing ****40,534 windows**** fresh, GPU at 65% / ~5.5 GB. No startup errors, checkpoint cache building as it goes.

It'll run ~25 min and I'll be notified automatically when the trajectory completes ? then I'll immediately generate the ****tuned**** segment CSV and hand it to you for eyeballing (baseline held back until you've anchored). I'll ping you the moment it's done; no polling needed in the meantime.

162. user (2026-06-06T15:12:00.640Z)

can you tail some logs or their summary to me? One of my dear asks is to always have some logs tailing from the long running jobs

163. user (2026-06-06T15:12:14.070Z)

```
=== last progress lines (wasb inference job b99pdx6kl) ===

```

164. assistant (2026-06-06T15:13:09.131Z)

Here's the live tail of the WASB inference job (`b99pdx6kl`):

```
...
[wasb_infer] 17200/40534 (42%) | 30.7 win/s | elapsed 561s | ETA 761s
[wasb_infer] 17600/40534 (43%) | 30.8 win/s | elapsed 572s | ETA 746s
[wasb_infer] 18000/40534 (44%) | 30.7 win/s | elapsed 586s | ETA 734s
...
- **Progress:** 44% (18,000 / 40,534 windows), **30.7 win/s** (a bit faster than estimated)
- **Elapsed ~10 min, ETA ~12 min**
- **GPU:** 89% util · 5.5 GB · 84°C (toasty but normal for sustained inference on the Max-Q)
- **Checkpoint working live:** 18,144 windows already persisted to `det_raw.jsonl`, manifest
`windows_done: 18144` ? so if it died right now, a resume would pick up from ~18k, not zero.
That's the checkpoint test passing in-flight.
```

Noted as a standing preference ? let me save that so future-me does it by default.

165. assistant (2026-06-06T15:13:16.908Z)

```

For any long-running background job (e.g. the WASB GPU inference pass, bulk fetches, big test runs), the user wants **periodic progress surfaced to them while it runs** ? a tail of the log lines plus a short summary (% done, rate, ETA, and resource use like GPU util/mem). This is a "dear ask": don't just report the final result.

Why: visibility into long jobs ? the user wants to see it's alive and progressing, catch a stall/regression early, and have an anchor on how long to wait.

How to apply:

- When you start a long background job, proactively tail it at sensible intervals (and at completion), not only when asked.
- A good snapshot = last few log lines + (windows/items done / total, rate, ETA) + GPU/CPU/mem where relevant. For WASB also show cached-windows / manifest windows_done (proves `[[current-state]]`'s checkpointing is keeping pace).
- For continuous tailing, offer ``/loop <interval> tail the <job> logs``.
- Job logs live at the background task's output file (the path returned when the Bash/PowerShell job is launched with `run_in_background`).

1      # Memory Index
2
3      ## ? Start here
4      - [Current state](current-state.md) ? **live micro-checkpoint** (updated every
checkpoint): open PRs, what just landed, next steps, open decisions. **Read this first.**
5      - [Session handoff](session-handoff.md) ? current state · next steps · open decisions ·
ramp-up kit. Updated only on request ("update the handoff").
6
7      - [Working agreement: attribution](working-agreement-attribution.md) ? never assert
fabricated facts; NEVER invent a provenance (a discussion/review/source that didn't happen). The
silver-bullet rule.
8      - [Working agreement: checkpoints](working-agreement-checkpoints.md) ? user prefers
frequent small PRs + a Claude-consumable current-state file updated at every micro-checkpoint.
9
10     ## Project: rally segmentation pipeline
11     - [Candidate segments & fine-tuning](candidate-segments-finetuning.md) ? why raw
detector candidates are persisted (detector-agnostic table); golden-eval-set goal
12     - [TrackNetV4/WASB via WSL2](tracknet-wasb-wsl2-decision.md) ? self-hosted shuttle
trajectory models (not LLM APIs); WASB/TrackNetV3 = MIT, commercial-clear
13     - [Collector?indexer bridge](collector-indexer-bridge.md) ? 4-phase plan to train/eval a
generic temporal rally segmenter; Phases 1?2 done, 3 in progress, 4 next
14     - [Golden-set vendoring](golden-set-vendoring.md) ? generate golden rally labels via
3rd-party vendors (Bangalore-local) + extensible regression flow; Roora selected for a 3-sport
pilot, guideline + collector ingestion built, GS-1/2/4 landed, GS-3 + gold key pending
15
16     ## Monetization (hosted API)
17     - [Monetization plan](monetization-plan.md) ? hosted video?highlights API on a GPU VM;
licensing & per-video cost are first-class; user is Bangalore-based
18     - [Monetization research status](monetization-research-status.md) ? audit done:
Ultralytics AGPL swapped out (PR #8); MonoTrack/YOLO-NAS weights avoided; codec=watch; full
report in docs/
19
20     ## Forward-looking
21     - [Sibling internship repo](sibling-internship-repo.md) ? separate khelacharya repo
builds shot-intelligence ON TOP of our rally segmentation; keep the repos separate
22

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\MEMORY.md has been updated successfully. (file state is current in your context ? no need to Read it back)

170. user (2026-06-06T15:13:41.307Z)

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\MEMORY.md has been updated successfully. (file state is current in your context ? no need to Read it back)

171. assistant (2026-06-06T15:13:58.922Z)

Saved that as a standing preference (and while I was in the index I also corrected the stale "separate khelacharya repo" line). From now on I'll tail long jobs proactively, not just on request.

For ***this*** run, two ways to keep logs flowing ? your pick:

- I set up ``/loop 3m tail the wasb inference job`` and it auto-posts a progress snapshot every ~3 min until the trajectory finishes.
- Otherwise I'll post the next tail at completion (~12 min out), and you can type "tail" anytime for an instant snapshot.

Either way the job keeps running untouched. Want the auto-loop?

172. user (2026-06-06T15:15:06.173Z)

no our "secret code" works ... I keep walking away from desk so only need when I am back.

173. assistant (2026-06-06T15:15:19.589Z)

Got it ? on-demand it is. You type the trigger when you're back at the desk, I pull a fresh snapshot; no noise while you're away. Let me refine the saved preference so it reflects that exactly.

174. user (2026-06-06T15:15:25.481Z)

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\feedback-tail-long-job-logs.md has been updated successfully. (file state is current in your context ? no need to Read it back)

175. assistant (2026-06-06T15:15:29.422Z)

Locked in: "tail" = instant snapshot whenever you're back, silence while you're away, and I'll auto-post when the trajectory finishes (~10 min out at last check). Inference is still humming along on the GPU. Walk away freely. ?

176. user (2026-06-06T15:16:49.821Z)

Is there a way you can prepare a "cold detailed rampup" for yourself and your future incarnations, something which becomes a handoff artifact. Essentially, some sort of a cryptic / nerdy way to store the code details so that you can ramp up quickly instead of doing a DFS/BFS

177. user (2026-06-06T15:17:08.915Z)

[Request interrupted by user]

178. user (2026-06-06T15:17:08.966Z)

sry "cold => code"

179. assistant (2026-06-06T15:18:20.858Z)

Love this ? a dense, Claude-optimized **code map** that future-me reads to ramp up on the **codebase** instantly instead of re-deriving it by crawling files. The right home is a version-controlled repo doc (code structure belongs with the code, not in memory ? memory will just point to it).

Since ultracode is on and this means accurately mapping the whole codebase, I'll fan out parallel mappers over each subsystem, synthesize into one dense artifact, then run an adversarial verify pass so nothing in the map is fabricated. First, let me get the real file inventory so I scope the mappers to actual paths.

Inventory's in hand ? 40+ modules across `indexer/`, `detectors/`, `eval/`, `stitcher/`, `tools/`, `sports/`, `providers/`, `annotations/`, `validators/`, plus the run_*.py entry points. I'll author a workflow: 6 parallel mappers (one per subsystem) ? synthesize into one dense map ? adversarial verify against the real files so nothing's fabricated.

184. user (2026-06-06T15:20:37.431Z)

Workflow launched in background. Task ID: wsgj3hrdc
Summary: Map the badminton-highlight-indexer codebase into a dense, Claude-optimized CODE_MAP.md (parallel mappers -> synthesize -> adversarial verify)
Transcript dir: C:\Users\avidu\claudu\projects\C--Users-avidu-Projects-badminton-highlight-indexer\42211f80-2169-4025-ad9d-99c1aa29ff70\subagents\workflows\wf_d4359b2a-456
Script file: C:\Users\avidu\claudu\projects\C--Users-avidu-Projects-badminton-highlight-indexer\42211f80-2169-4025-ad9d-99c1aa29ff70\workflows\scripts\build-code-map-wf_d4359b2a-456.js
(Edit this file with Write/Edit and re-invoke Workflow with {scriptPath: "C:\Users\avidu\claudu\projects\C--Users-avidu-Projects-badminton-highlight-indexer\42211f80-2169-4025-ad9d-99c1aa29ff70\workflows\scripts\build-code-map-wf_d4359b2a-456.js"} to iterate without resending the script.)
Run ID: wf_d4359b2a-456
To resume after editing the script: Workflow({scriptPath: "C:\Users\avidu\claudu\projects\C--Users-avidu-Projects-badminton-highlight-indexer\42211f80-2169-4025-ad9d-99c1aa29ff70\workflows\scripts\build-code-map-wf_d4359b2a-456.js", resumeFromRunId: "wf_d4359b2a-456"}) ? completed agents return cached results.

You will be notified when it completes. Use /workflows to watch live progress.

185. assistant (2026-06-06T15:20:47.936Z)

Workflow is running in the background (`wsgj3hrdc`): 6 subsystem mappers ? synthesis ? adversarial verify pass. When it finishes I'll drop the result into `docs/CODE\_MAP.md` for your review (and offer it as a small docs PR).

So two jobs cooking now:
- `b99pdx6kl` ? WASB inference (was ~10 min out; likely near done)
- `wsgj3hrdc` ? code-map workflow

Both auto-notify on completion. I'll generate the tuned segment CSV the moment inference lands, and surface the code map when the workflow lands. "tail" anytime you're back for a snapshot of either.

186. user (2026-06-06T15:21:28.589Z)

(Guess the tokens, CPU and network bandwidth you would save if Anthropic implemented this for everyone who frequently opens some codebases!)

187. assistant (2026-06-06T15:22:31.048Z)

Fun one. Let me Fermi it honestly ? the per-ramp numbers I can defend; the fleet-wide number depends on Anthropic's user counts, which I don't have, so I'll keep that part as a plug-in-your-own formula rather than pretend I know it.

The unit being saved: one cold ramp-up = the DFS/BFS I'd otherwise do (a flurry of Glob/Grep/Read) replaced by a single ~5k-token map read.

Per cold ramp-up:

- Avoided input tokens (file contents + tool results dragged into context): ~50k?120k, call it ~80k.
- Avoided output tokens (the multi-turn "what do I open next" reasoning + tool-call args): ~5k?15k, call it ~8k. This is the **expensive** slice ? output tokens cost ~4?5× input on price and are far heavier in FLOPs (autoregressive, one forward pass per token vs. a single batched prefill for input).
- Minus the map read (~5k in). Net ? 75k input + 8k output saved, and ~20?40 fewer tool round-trips (~30?90s less wall-clock).

Fleet math (parametric ? these inputs are illustrative, not Anthropic data):

saved ? $S \cdot U \cdot R$, where S ? 85k tokens/ramp, U = weekly-active codebase users, R ? 8 cold ramps/user/week.

- $U = 100k$? ~68B tokens/week (~3.5T/yr)
- $U = 1M$? ~680B/week (~35T/yr)
- $U = 10M$? ~6.8T/week (~350T/yr)

CPU/GPU: tokens are the proxy for inference FLOPs. The ~8k saved **output** tokens per ramp is where the GPU-seconds live; at the 1M-user line that's ~64B output tokens/week not generated ? real datacenter-hours, and it's the compounding kind because every avoided tool turn also avoids re-prefilling the growing context.

Network: ~80k tokens ? ~300?500 KB of text per ramp that never crosses the tool?model?client hops, plus the round-trip/latency tax of 25-ish calls. At 1M users that's ~3?4 TB/week ? modest next to the token bill, but the latency win is what a human actually feels.

The honest caveats, because the headline number flatters itself:

- Prompt caching already kills most **intra-session** re-reads; the real prize is **cross-session cold starts** and post-compaction re-exploration.
- The map isn't free: generating a good one costs ~150k?500k tokens (this very workflow is in that range), and it drifts, so subtract regeneration/incremental-update cost. Break-even is ~2?6 reads ? trivial for a repo you "frequently open," which is exactly your framing.
- Not every session ramps cold; warm continuations get nothing.
- It partly exists already ? CLAUDE.md, ``/init``, repo memory all chase this. The novel bit here is a **dense, anchor-rich, machine-first** map plus a **deterministic regen pipeline**, so it stays true instead of rotting into stale prose.

So: per-ramp, a clean ~10× reduction in ramp cost (85k ? ~5k tokens, 25 tool calls ? 1). Fleet-wide, "tens of trillions of tokens a year" is a defensible order of magnitude at 1M+ heavy users ? dominated economically by the small output-token slice, not the big input one. Both background jobs still cooking; I'll surface them as they land.

188. user (2026-06-06T15:23:35.680Z)

```

<status>completed</status>
<summary>Background command "Run WASB inference on 40k frames (background, checkpointed)"
completed (exit code 0)</summary>
</task-notification>
```

189. assistant (2026-06-06T15:23:50.195Z)

Inference finished (exit 0) ? the stress test passed without needing the checkpoint recovery. Let me confirm the trajectory, pull it to a Windows-readable path, and generate the tuned segments.

190. user (2026-06-06T15:23:58.219Z)

=== inference final lines ===

[wasb_infer] 40534/40534 (100%) | 31.9 win/s | elapsed 1272s | ETA 0s

```
[wasb_infer] detection done in 1272s; running tracker...
[wasb_infer] wrote 40536 rows -> /home/avidullu/clips/adarsh_traj.csv
[wasb_infer] visible-shuttle frames: 13224/40536
=== copy trajectory WSL -> Windows + cache summary ===
copied
40537 /home/avidullu/clips/adarsh_traj.csv
cache windows_done: "windows_done": 40534
```

191. assistant (2026-06-06T15:24:06.279Z)

Trajectory complete: ****40,536 rows, 13,224 visible-shuttle frames (32.6%)*** ? a sane shuttle-detection rate for a real match. Inference ran 21 min at 31.9 win/s; cache fully populated (the checkpoint kept pace the whole way). Now the ****tuned**** segments for your eyeball anchor.

192. user (2026-06-06T15:24:08.164Z)

```
=== WASB tuned-segment export ===
tuned cfg (0.05, 1.0, 1.0): 65 rally segments, 251.4s of play ->
output/adarsh_tuned_segments.csv
```

193. assistant (2026-06-06T15:24:17.804Z)

Tuned export done: ****65 rally segments, 251.4 s of play**** (~37% of the 11m16s video). Here's the full list for scrubbing (mm:ss, matches your VLC overlay):

194. user (2026-06-06T15:24:18.448Z)

Where to point your eyes (no ground truth for this video, so this is just my read of the structure):

- Strongest anchors (long, high-confidence rallies ? verify the detector locks onto real play): #20 (14.1s @ 2:53.9), #4 (10.2s), #48 (8.8s), #14 (8.6s), #9, #28.
- Suspect-short (~1?1.5s, where tuned min_duration=1.0 is permissive ? likely a mix of quick serves and noise from player/camera motion): #1, #7, #13, #25, #26, #30, #35, #37, #42, #45, #55, #64.
- Two notable quiet gaps to sanity-check: 9:01?9:32 (~31s nothing) and 10:06?end (~70s nothing) ? probably a changeover/end-of-match, but confirm it's not the detector dropping real play.

Important caveat (same as before): the tuned thresholds (0.05/1.0/1.0) were calibrated on the *static-camera Sample Long Video*, not this one ? so treat #65 and the short ones as "does this config transfer?" evidence. Baseline (0.02/2.0/2.0) is staged and one command away whenever you've anchored on these and want the side-by-side.

Code-map workflow (`wsgj3hrdc`) is still running; I'll surface it when it lands.

backend/tools/rally_slicer.py; run_eval.py; run_phase3_eval.py; run_regression.py;
run_process_and_stitch.py; config.json; setup.py; tests/test_*.py. All cited symbols, registry
singletons, ABCs, dataclasses, constants, MD5 chunk sizes (main=64KB, run_process=1MB,
run_eval=8KB, phase3=64KB), and the candidate-window / det_raw.jsonl / manifest.json / Score
data contracts verified present and correct.", "FIXED (substantive) ? Validator execution order
was WRONG in section 1A. Map had 'Format -&gt; ResolutionFPS -&gt; Blur -&gt; SceneCut -&gt;
PTSContinuity -&gt; Relevance'. backend/validators/__init__.py registers (and run_all executes)
in this order: FormatValidator -&gt; ResolutionFPSValidator -&gt; PTSContinuityValidator -&gt;
SceneCutDensityValidator -&gt; BlurValidator -&gt; RelevanceValidator. Since the map stresses
'registration order = execution order', this is load-bearing. Corrected inline.", "FIXED
(substantive) ? config.json sections: map claimed 'indexing (+tracknet, .wasb)'. Verified
config.json has an indexing.tracknet block but NO indexing.wasb block (grep 'wasb' on
config.json: no matches). WasbHybridSegmenter/WasbConfig.from_indexing_cfg fall back to
WasbConfig defaults when wasb is absent. Corrected to 'indexing (+tracknet; .wasb consumed but
NOT in checked-in config -&gt; WasbConfig defaults)'.", "FIXED (substantive) ?
training.extract_yolo_features gotcha was wrong. Code does `stats = row.get('stats') or {}` then
`stats.get(...)`. If `stats` is a raw JSON string (not a dict), `.get` raises AttributeError
(CRASH), it does NOT silently yield an all-zero vector. Softened the warning to 'assumes
row[\\`stats\\`] is already a dict (DB layer deserializes it); a raw JSON str would
AttributeError, not zero-fill'.", "FIXED (minor) ? scene_cut.py: map said 'only first ~100 frames
analyzed'. Actual: samples at 2fps (sample_interval=fps/2) and caps at 100 SAMPLED frames -&gt;
covers ~first 50s of video, not first 100 raw frames. Clarified inline.", "FIXED (minor) ?
metrics.MatchResult field names: map's eval-primitives contract abbreviated them as
'unmatched_pred(=FP)/unmatched_gt(=FN)'. Actual attribute names are unmatched_pred_indices /
unmatched_gt_indices. Annotated inline.", "VERIFIED (no change) ? main.py argparse is flags not
subcommands (--setup/--debug-clip/--server/--trim-start+--trim-end/--video-path); kept the map's
loose '(server/process/debug-clip/trim/--setup)' phrasing but it denotes flags/modes, not
argparse subcommands. uvicorn host hardcoded 127.0.0.1, CLI default_segmenter fallback 'motion'
confirmed.", "VERIFIED (no change) ? Three-default-segmenter divergence confirmed exactly:
config.json default_segmenter='gemini', setup.py generated config 'yolo_hybrid', main.py/.get
fallback 'motion'. setup.py generated config also omits relevance + tracknet blocks and uses
blur 100.0 (vs config.json 20.0).", "VERIFIED (no change) ? regression.py imports
annotation_registry from backend.annotations (NOT backend.eval.annotations); gate fires on
precision OR recall, F1 reported-not-gated; no-baseline first run passes. Exit codes 0/1/2 in
run_regression.py confirmed; --update-baseline snapshots after compare.", "VERIFIED (no change) ?
wasb_infer cache contract (det_raw.jsonl [{w,f:[{fid,[{x,y,score,scale}...}]}], contiguous
w==line-index heal, manifest.json fields, CACHE_VERSION=1, _dets_to_tracker rebuilds xy as
np.array, runner.gpus=[0]) all match. WasbRunner.run_predict does NOT pass cache flags (uses
```

```

wasb_infer defaults flush=1000/batch=8/workers=4) confirmed.", "NOT VERIFIABLE (left as-is) ?
Section 4 (WASB WSL contract) describes the external dep ~/models/WASB-SBDT which is not in this
repo; its symbol claims (TracknetV2Detector.run_tensor, OnlineTracker, ImageDataset,
hrnet/frames_in=3/512x288) could not be checked against source. The repo-side caller
(wasb_infer.py _build_cfg overrides model=wasb/detector.model_path/runner.gpus=[0]) is
consistent with it. Section 5 (sibling repo sports-data-collector) likewise external and
unverifiable here.]", "final_map": "# CODE_MAP.md\n\n**Purpose:** cold-start navigation map for

197. assistant (2026-06-06T15:33:15.608Z)

The code-map workflow finished ? and the adversarial verify pass earned its keep: it flagged `verify\_accurate: false` because it caught and **fixed real inaccuracies** the synthesis introduced. Notably:

- Validator execution order was wrong (the actual order is Format ? ResolutionFPS ? **PTSContinuity ? SceneCut ? Blur** ? Relevance)
- The map claimed a `config.json` `indexing.wasb` block that **doesn't exist** (WasbConfig falls back to defaults)
- A wrong gotcha about `training.extract\_yolo\_features` (it'd `AttributeError`, not zero-fill)
- `scene\_cut` sampling and `MatchResult` field-name corrections

That's exactly why the verify phase exists. Let me pull the full corrected map out of the result file and write it to `docs/CODE\_MAP.md`.

198. user (2026-06-06T15:33:20.211Z)

```

@backend/validators/base.py::registry.run_all(video_path, config)
25     FormatValidator -> ctx['ffprobe_meta'] -> ResolutionFPSValidator -> PTSContinuity
-> SceneCut -> Blur -> Relevance (? ACTUAL registration/exec order ? see
@backend/validators/__init__.py)
26     -> db.add_video(video_id, filepath, status, [r.dict()]) @backend/database.py
27     -> seg = segmenter_registry.get(name)(db, config) ?
@backend/indexer/base.py::segmenter_registry
28     -> segments = seg.process_video(video_id, video_path, player_pool?, max_frames?)
29     [STOP POINT: segments-only ? predictions now in DB; eval/regression operate here
without stitching]
30     -> select segment ids -> [(start,end)] (+ stitching padding)
31     -> VideoCompiler.compile_highlights(filepath, time_pairs, out_name)
@backend/stitcher/compiler.py
32     per-clip ffmpeg re-encode (libx264/superfast/crf22) -> concat -c copy ->
output/<name>.mp4
33     ```
34     Hybrid segmenter internal 4-phase (yolo_hybrid / tracknet_hybrid / wasb_hybrid ? same
shape):
35     ```
36     P1 chunk video (yolo only; tracknet/wasb = whole-video single pass, chunk_index=0)
37     -> P2 candidate "action windows" from motion/trajectory [STOP: candidates persisted
via db.add_candidate_segment]
38     -> P3 pad clip (ai_handoff_padding) -> ThreadPoolExecutor ->
provider.analyze_video(clip, prompt) ? provider_registry
39     -> P4 db.add_play_segment + db.link_candidate_to_segment
40     ```
41     Pure-AI path `gemini`: no P2; chunk-or-single -> provider -> heavy validate
(clamp/dedup) -> add_play_segment.
42     Legacy `motion`: pixel-diff -> segments + **fabricated** metadata/events (? not ground
truth).
43
44     ### 1B. WASB shuttle substrate (P2 of wasb_hybrid)
```

```

45     ...
46     WasbHybridSegmenter.process_video @backend/indexer/wasb_hybrid.py
47     -> WasbRunner.healthcheck() (gate; not ok -> return [])
@backend/detectors/wasb_runner.py
48     -> WasbRunner.run_predict(video, out_dir)
49     stage video + wasb_infer.py into WSL fs -> `wsl bash -c 'source conda.sh && python
wasb_infer.py ...`
50     -> @backend/detectors/wasb_infer.py::run (WSL): sliding windows -> GPU detector
pass (CHECKPOINTED det_raw.jsonl) -> CPU tracker (always full re-run) -> trajectory CSV
51     -> TrackNetRunner.parse_trajectory_csv(csv) @backend/detectors/tracknet_runner.py
(shared, re-exported by WasbRunner)
52     -> TrackNetRunner.trajectory_to_action_windows(points, fps, frame_width, chunk_start,
velocity_thresh, merge_gap, min_window_duration, chunk_index) [the model-agnostic WINDOWING
BRAIN]
53     ...
54     (`tracknet_hybrid` identical, swapping WasbRunner->TrackNetRunner; `_probe_fps_width`
fallback (30.0, 1280.0).)
55
56     ### 1C. Calibration / eval flow (NO pipeline run unless told)
57     ...
58     GT CSV -> annotations.load_annotations / calibrate_wasb.load_golden_gts ->
List[Interval]
59     DB predictions -> harness.get_predictions(db, video_id, stage) -> List[Interval] stage
? {candidates, final}
60     -> metrics.match_intervals (greedy temporal-IoU) -> metrics.score -> Score
61     -> harness.evaluate -> EvalReport -> report_to_dict
62     -> batch.aggregate (corpus micro/macro) @backend/eval/batch.py
63     -> regression.regress(_with_provider) vs baseline @backend/eval/regression.py
[CI gate]
64     Calibration: calibrate_wasb.run -> calibration.{select_best, improvement_report,
cross_validate} @backend/eval/calibration.py
65     Learned segmenter (offline): training.build_training_set(X,y) ->
classifier.LogisticRegression.fit/save
66     ...
67     Entrypoints: `@run_eval.py` (single video score), `@run_phase3_eval.py` (manifest batch,
can segment), `@run_regression.py` (baseline gate, exit 1=regression),
`@backend/eval/calibrate_wasb.py` + `@backend/eval/export_wasb_segments.py` (WASB tuning
drivers).
68
69     ---
70
71     ## 2. SUBSYSTEMS
72
73     ### 2.0 Orchestration & config
74     - `@backend/main.py` ? FastAPI app + argparse CLI (modes via FLAGS, not subcommands:
`--server`/`--video-path` (process)/`--debug-clip`/`--trim-start`+`--trim-end`/`--setup`).
75     - `::app` FastAPI; `::db_instance`, `::global_config` module globals set ONLY in
`main()`. ? importing `app` for ASGI without `main()` -> both `None` -> every endpoint NPEs.
76     - `::process_video` `@POST /api/process` -> validate -> add_video -> segment.
`::compile_highlights` `@POST /api/compile`. `::run_cli_diagnose_clip` lazy `import cv2`,
samples ±3s vs `indexing.motion_threshold`.
77     - ? uvicorn host hardcoded `127.0.0.1`; CLI default_segmenter fallback `motion`.
78     - `@run_process_and_stitch.py` ? one-shot demo; ? hardcoded paths, interactive `input()`
(blocks automation), `default_segmenter` fallback `yolo_hybrid`, skips validation.
79     - `@run_eval.py::main` ? score one video's DB preds vs GT CSV.
`--stage{candidates,final,both}`. Exit 2=arg/IO. ? pure scorer; errors if video never processed.
80     - `@run_phase3_eval.py::main` ? walk manifest, segment-if-needed, score, aggregate.
`load_dotenv()` at import. ? DB key = file MD5, NOT manifest's `video_id` (kept as label
`collector_video_id`).
81     - `@run_regression.py::main` ? `regress_with_provider` vs baseline. Exit codes semantic:
`*0`=ok, 1=REGRESSION (CI gate), 2=missing DB*. ? `--update-baseline` runs AFTER compare
(snapshots even a regressing run).
82     - `@config.json` ? single config. Sections: `validation` (+ `relevance`), `indexing` (+
`tracknet`; ? NO `wasb` block in checked-in config ? WASB runs use `WasbConfig` defaults),
`output`, `stitching`, root `sport/ai_provider/ai_model`. ? **three default segmenters

```

```

diverge**: config ships `gemini`, setup.py writes `yolo_hybrid`, main.py fallback `motion`.
83     - `@setup.py` ? write default config (skips if present), ffmpeg/torch/CUDA diagnostics,
GPU-aware pip (`nvidia-smi` -> cu124 else cpu). ? generated config diverges from checked-in (no
`relevance`/`tracknet` blocks, blur 100.0 vs 20.0).
84
85     ### 2.1 Segmenters (indexer) ?
86     - `@backend/indexer/base.py`
87     - `::BasePlaySegmenter` ABC ? `__init__(db, config)`; abstract
`name`,`description`,`process_video`. $ `process_video(video_id, video_path, player_pool=None,
max_frames=None) -> List[dict{id,start_time,end_time,duration,metadata}]`.
88     - `::SegmenterRegistry`, `::segmenter_registry` (singleton). ? **register a new
segmenter**: subclass `BasePlaySegmenter`, call `segmenter_registry.register(MyCls)` at module
bottom, AND import the module in `@backend/indexer/__init__.py` (registration is an IMPORT side-
effect). ? `register()` builds `cls(None, {})` just to read `.name` -> name/description MUST NOT
touch `self.db`/`self.config`.
89     - `@backend/indexer/__init__.py` ? imports all 5
(`motion,gemini,yolo_hybrid,tracknet_hybrid,wasb_hybrid`) = the de-facto registration manifest.
90     - `@backend/indexer/wasb_hybrid.py::WasbHybridSegmenter` (name `wasb_hybrid`) ? WSL
WASB substrate. Config `indexing.wasb.velocity_threshold(0.02)` + shared
`dead_time_merge_gap/min_action_window_duration/ai_handoff_padding/ai_max_workers`. ? whole-
video single pass; reuses YOLO-named keys `log_yolo_candidates/store_yolo_candidates`; hardcoded
relative out dir `output/wasb`; needs `{PROVIDER}_API_KEY` (missing -> []). Registered at module
bottom.
91     - `@backend/indexer/tracknet_hybrid.py::TrackNetHybridSegmenter` (name
`tracknet_hybrid`) ? copy-paste twin of wasb_hybrid (swaps runner; `detection_params` adds
`queue_length`). ? any P3/P4 fix must be applied to BOTH (and arguably yolo_hybrid).
92     - `@backend/indexer/yolo_hybrid.py::HybridYoloSegmenter` (name `yolo_hybrid`, no YOLO
remains ? torchvision detector + supervision ByteTrack). `::PERSON_CLASS_ID=1` ? (ultralytics
used 0; wrong value -> zero detections). `::lazy_load_model`,
`::extract_action_windows_from_chunk`,
`::DETECTOR_FACTORIES`/`::DEFAULT_DETECTOR='fasterrcnn_resnet50_fpn'`. ? velocity computed at
`effective_fps = fps/frame_skip` -> `yolo_velocity_threshold` coupled to `frame_skip`; trackers
per-chunk (windows merged by TIME not ID); `import torch` at module top.
93     - `@backend/indexer/gemini.py::GeminiPlaySegmenter` (name `gemini`) ? pure-AI, no P2.
? chunks only if `duration>chunk_duration`; `max_workers=5` hardcoded (ignores
`ai_max_workers`); `max_segment_duration=90.0` hardcoded; `debug_duration` silently truncates
analysis; `parse_time` accepts colon timestamps (warns).
94     - `@backend/indexer/motion.py::MotionPlaySegmenter` (name `motion`) ? pixel absdiff
baseline. ? **metadata + serve/smash/foul/winner events are RANDOM**
(random.sample/randint/uniform/choice); only segmenter using `db.add_event` and passing
server/receiver; uses `print()`; honors `max_frames`.
95
96     ### 2.2 Detectors & windowing (WSL-quarantined)
97     - `@backend/detectors/__init__.py` ? docstring only (refs `docs/DECISIONS.md` ADR-001).
? does NOT re-export runners; import submodules directly.
98     - `@backend/detectors/tracknet_runner.py`
99     - `::TrackNetConfig`(`+.from_indexing_cfg`), `::TrackNetRunner` ? runs TrackNet
`predict.py` in WSL.
100     - `::to_wsl_mnt_path` (`C:\x`->`/mnt/c/x`), `::TrajectoryPoint`(frame,visible,x,y).
101     - `**::parse_trajectory_csv` @staticmethod** + `**::trajectory_to_action_windows`
@staticmethod** = MODEL-AGNOSTIC brain, re-exported verbatim by WasbRunner. ? `weights_path`
defaults `` -> `run_predict` returns None; predict.py only `mp4/.avi`; `visible==False`
resets prev (occlusion gap breaks track); `fps<=0->30`, `frame_width<=0->1280` silent;
`track_id_count` hardcoded 1; `timeout_sec=0` -> NO timeout (hangs forever).
102     - `@backend/detectors/wasb_runner.py::WasbRunner`(`+::WasbConfig`) ? stages
`wasb_infer.py` + video into WSL, runs in `wasb` env.
`::parse_trajectory_csv`/`::trajectory_to_action_windows` = `staticmethod(TrackNetRunner.*)`. ?
`run_predict` does NOT pass cache flags (uses wasb_infer defaults flush=1000/batch=8/workers=4);
`wasb_infer.py` MUST be re-staged each run (editing Windows copy is inert until staged);
`_wsl_bash` duplicated (drift risk).
103     - `@backend/detectors/wasb_infer.py` (WSL) ? `::run` core. Reboot-resumable detector
cache: `::DET_FILE='det_raw.jsonl'`, `::MANIFEST_FILE='manifest.jsonl'`, `::CACHE_VERSION=1`,
`::load_and_clean_cache` (reads longest CONTIGUOUS prefix where `w==line index`, rewrites to
heal crash-truncated tail), `::manifest_compatible`,
`::atomic_write_text/_atomic_write_trajectory`, `::dets_to_tracker` (xy MUST be np.array). ?

```

```

GPU pass resumable; CPU tracker STATEFUL -> always fully re-run; `runner.gpus=[0]` hardcoded
single-GPU; `extract_frames` cv2-PNG SLOW (prefer host ffmpeg).
104
105     ### 2.3 Eval & calibration (all pure; I/O lives in CLI drivers)
106     - `@backend/eval/metrics.py` ? scoring primitive. `::interval_iou`, `::match_intervals`
(greedy, deterministic), `::score`->`::Score`(`.as_dict()` = wire shape), `::pr_curve`,
`::Match`, `::MatchResult`. ? greedy not Hungarian; `score()` indexes the SAME preds/gts used to
build `match_result` or boundary errors are silently wrong.
107     - `@backend/eval/annotations.py` ? generic GT loader. `::load_annotations` (`start,end`
CSV; RAISES on bad rows/`start>=end`), `::parse_timestamp` (decimal or MM:SS/HH:MM:SS),
`::write_scaffold`.
108     - `@backend/eval/calibration.py` ? overfit guard. `::cross_validate` (within-video
k-fold; ? defaults `metric='recall'` deliberately), `::leave_one_video_out` (honest cross-video;
needs ?? labelled videos), `::improvement_report` (OPTIMISTIC ? selected on full GT),
`::select_best`, `::kfold_indices`, `::pct_improvement`, `::evaluate`. ? `generalization_gap
>~0.1` = overfit alarm.
109     - `@backend/eval/calibrate_wasb.py` ? WASB tuning CLI. `::BASELINE=(0.02,2.0,2.0)` (?
hardcoded dup of real defaults), `::default_grid` (45 cfgs = 5x3x3), `::make_predict_fn`,
`::load_golden_gts` (? SILENTLY skips bad rows ? opposite of annotations.load_annotations). ?
CLI defaults `fps=59.94/frame-width=1920` baked in.
110     - `@backend/eval/export_wasb_segments.py` ? trajectory+cfg -> golden/slicer CSV +
comparison. `::TUNED=(0.05,1.0,1.0)` (? hardcoded from ONE video),
`::SEG_FIELDS`, `::COMP_FIELDS`, `::build_comparison`. `--slice` requires `--video`.
111     - `@backend/eval/batch.py` ? corpus aggregation. `::aggregate` (micro pool TP/FP/FN, TP-
weighted mean_iou, macro F1), `::default_stages_for` (`auto`;
`::FINAL_ONLY_SEGMENTERS={motion,gemini}`), `::resolve_video_path`.
112     - `@backend/eval/harness.py` ? DB-pred scorer. `::STAGES=('candidates','final')`,
`::get_predictions` (candidates->`query_candidate_segments(detector=)`);
final->`query_play_segments({})` ALL segs, detector arg ignored),
`::evaluate`->`::EvalReport`(`::StageReport`)->`::report_to_dict` (input contract for
batch.aggregate).
113     - `@backend/eval/training.py` ? learned-segmenter data layer. `::YOLO_FEATURE_NAMES`
(5-d), `::extract_yolo_features` (? assumes `row['stats']` is already a dict ? the DB layer
deserializes it; a raw JSON STR would AttributeError, not zero-fill; missing fields default
0.0), `::label_candidates` (same IoU matching as evaluator),
`::build_training_set`->(X,y,intervals).
114     - `@backend/eval/classifier.py::LogisticRegression` ? numpy-only logreg (no sklearn).
`fit/predict_proba/predict/to_dict/from_dict/save/load`. ? `class_weight='balanced'` default;
feature ORDER at predict must match fit (names are metadata only, not used in math); fixed 1000
epochs.
115     - `@backend/eval/regression.py` ? CI gate. `::DEFAULT_TOLERANCE=0.05`,
`::DEFAULT_BASELINE_PATH=output/regression_baseline.json`, `::regress`,
`::regress_with_provider`, `::save_baseline`/`::load_baselines`, `::RegressionResult`. ? imports
`annotation_registry` from `**`backend.annotations`** NOT `backend.eval.annotations` (two
different "annotations"); gate fires on precision OR recall drop (F1 reported, not gated); first
run on a video silently passes (no baseline).
116
117     ### 2.4 Stitcher / tools / utils
118     - `@backend/stitcher/compiler.py::VideoCompiler` ? `compile_highlights(raw,
segments:[(start,end)], out_name)`. Per-clip re-encode -> `-f concat -c copy`. $ skipped tuple
`(idx,start,end,reason)`. ? if duration probe fails (0.0) NO boundary validation; `padded_start`
uses `begin_padding`(0.5)/`end_padding`(1.0) defaults; temp clips in a TemporaryDirectory under
output_dir; raises ValueError/FileNotFoundError/RuntimeError; uses `print()`.
119     - `@backend/tools/rally_slicer.py` ? standalone CLI. `::compute_clip_windows` (pure,
unit-tested), `::load_rally_labels` (golden schema; ? silently skips degenerate rows),
`::slice_rallies`, `::BEGIN_PADDING=0.5`/`::END_PADDING=1.0` (? duplicate compiler's by copy,
kept in sync manually). `read_time` -> backend/eval/annotations.parse_timestamp.
120     - `@backend/utils/video.py` ? `::get_video_duration` (ffprobe),
`::extract_video_chunk(...,reencode=False)`. ? uses `-t DURATION` (length, not end ts); copy
mode cuts at nearest keyframe (drift) ? pass `reencode=True` for short/accurate clips.
121     - `@backend/utils/geometry.py` ? `::get_velocity_normalised` (used by yolo_hybrid),
`::calculate_iou` (? +1 px convention inflates IoU), `::get_center/get_distance/get_velocity`.
122
123     ### 2.5 Validators ?
124     - `@backend/validators/base.py::VideoValidator` ABC, `::ValidationResult` (pydantic),

```

```

`::ValidationRegistry`, `::registry` (singleton). $ `validate(video_path, config, context)` ->
ValidationResult`. ? **add a validator**: subclass + `registry.register(MyValidator())`
(registration order = execution order). ? validators share a per-run `context` dict; exceptions
wrapped as `passed=False` (never abort batch).
125     - `@backend/validators/__init__.py` ? registers in EXEC order: FormatValidator,
ResolutionFPSValidator, PTSContinuityValidator, SceneCutDensityValidator, BlurValidator,
RelevanceValidator (? producers before consumers ? format_check first).
126     - `@backend/validators/format.py::FormatValidator` (`format_check`) ? **PRODUCER** of
`context['ffprobe_meta']`; ? MUST run before resolution_fps; container check is substring
`mp4` (lowercased).
127     - `@backend/validators/resolution_fps.py::ResolutionFPSValidator`
(`resolution_fps_check`) ? CONSUMES `ffprobe_meta` (? hard-fails if format_check didn't run
first). `min_fps` default 29.9; min res 1280x720.
128     - `@backend/validators/pts_continuity.py::PTSContinuityValidator`
(`pts_continuity_check`) ? ? 10.0s keyframe-gap threshold hardcoded, comment says 8.0s (drift);
any backward jump fails.
129     - `@backend/validators/scene_cut.py::SceneCutDensityValidator` (`scene_cut_check`) ? ?
`cut_threshold=0.6` hardcoded; samples at 2fps and caps at 100 SAMPLED frames (~first 50s of
video, not first 100 raw frames).
130     - `@backend/validators/blur.py::BlurValidator` (`blur_check`) ? Laplacian var <
`min_blur_threshold`(100.0) = fail; samples 15 frames.
131     - `@backend/validators/relevance.py::RelevanceValidator` (`relevance_check`) ? HSV
court-green; lazy `import backend.sports`; ? unknown sport -> empty sport cfg, falls back to
defaults, does NOT fail.
132
133     ### 2.6 Sports / Providers / Annotations / DB ?
134     - `@backend/sports/base.py::SportProfile` ABC
(`name`, `get_prompt`, `get_relevance_config`);
`@backend/sports/badminton.py::BadmintonSportProfile` (the Gemini prompt + HSV relevance cfg);
`@backend/sports/__init__.py::sport_registry` (+`::SportRegistry`, auto-registers badminton). ?
**add a sport**: subclass `SportProfile`, `sport_registry.register(MyProfile)`. $ prompt emits
JSON array `{start_time(float DECIMAL SEC), end_time, shuttle_exchange_count(int),
shot_count_confidence('Low'|'Medium'|'High')}`. ? prompt actively defends against MM:SS
timestamps; `get()` returns a fresh instance each call.
135     - `@backend/providers/base.py::AIVideoProvider` ABC (`__init__(api_key, model_name)`);
`@backend/providers/gemini.py::GeminiProvider` (upload->poll->generate JSON temp 0->delete);
`@backend/providers/__init__.py::provider_registry` (+`::ProviderRegistry`, auto-registers
`gemini`). ? **add a provider**: subclass, `provider_registry.register('name', MyCls)` (key
passed EXPLICITLY, unlike sport_registry); `get(name, api_key, model_name)`. $
`analyze_video(path, prompt, chunk_duration=0.0, label='')` -> (segments:list,
metrics:dict{upload_time, process_time, gen_time}). ? blocking `time.sleep(10)` poll; returns
`([], metrics)` on ANY failure (empty != error); lazy client (auth surfaces on first use).
136     - `@backend/annotations/base.py::AnnotationProvider` ABC (`submit/poll/fetch/annotate`),
`::Interval` (= metrics.Interval), `::STATUSES`, `::AnnotationProviderRegistry`,
`::annotation_registry`. ? **add a tier**: subclass (define `name`), call
`annotation_registry.register(MyCls)` at module bottom + import in `__init__.py` (registry keys
off `provider_cls().name`). $ `fetch` -> List[Interval] sorted; contract says RAISE (not `[]`)
on unavailable (`[]` silently zeroes recall).
137     - `@backend/annotations/file_provider.py::FileProvider` (`file`; job_id IS the
resolved CSV path; -> `backend.eval.annotations.load_annotations`).
138     - `@backend/annotations/automated_provider.py::AutomatedProvider` (`auto`; injectable
`labeler`, `::warn_if_same_lineage` ORACLE RULE, default `_not_configured` RAISES
NotImplementedError). ? get via `annotation_registry.get('auto', labeler=fn, lineage='...')`.
139     - `@backend/annotations/__init__.py` ? ? `noqa F401` imports are load-bearing (removing
de-registers providers).
140     - `@backend/database.py::Database` ? SQLite, 4 tables
(`videos/play_segments/events/candidate_segments`), `PRAGMA user_version` migration ladder in
`_init_db` (currently =1). Methods: `add_video`, `add_play_segment`, `add_event`, `add_candidate_se
gment`, `link_candidate_to_segment`, `query_candidate_segments`, `query_play_segments`, `get_video`,
`clear_video_data`. ? every conn re-issues `PRAGMA foreign_keys=ON` (else CASCADE silently
skipped); `add_video` is `INSERT OR REPLACE` -> cascade-DELETES dependent segments on re-ingest;
write helpers swallow exceptions (return False/None); events column is `type` not `event_type`;
`duration` stored not derived.
141
142     ---

```

```

143
144     ## 3. DATA CONTRACTS (canonical shapes ? one place)
145
146     $ **Trajectory CSV** (produced by tracknet/wasb predict, consumed by
`parse_trajectory_csv`):
147     `Frame,Visibility,X,Y` ? header+column order fixed; `Visibility==1`=visible; X,Y pixel
coords. Row = `(fid, 1|0, x or -1, y or -1)`.
148     -> `TrajectoryPoint{frame:int, visible:bool, x:float, y:float}` (frame-sorted).
149
150     $ **Candidate window dict** (produced by `trajectory_to_action_windows` AND yolo
`_extract_action_windows_from_chunk`):
151     `{start:float(sec), end:float(sec), active_frame_count:int, peak_velocity:float,
mean_velocity:float, track_id_count:int(==1 for trajectory), chunk_index:Optional[int]}`.
152     `start/end = group_frame/fps + chunk_start`.
153
154     $ **candidate_segments DB row** (`db.add_candidate_segment` /
`query_candidate_segments`):
155     `{id, video_id, detector:str, chunk_index, start_time:REAL, end_time:REAL,
duration:REAL, confidence:REAL(min(1.0,peak_velocity)),
stats:JSON{peak_velocity,mean_velocity,active_frame_count,track_id_count},
detection_params:JSON{...}, confirmed_segment_id, human_label, notes, created_at}`
(stats/detection_params deserialized on read).
156     `detection_params` keys by detector:
wasb=`{detector,velocity_thresh,merge_gap,min_action_window_duration,weights_path}`; tracknet
adds `queue_length`; yolo=`{velocity_thresh,merge_gap,frame_skip,tracker,detector_model,detector
_score_threshold,min_action_window_duration}`.
157
158     $ **play_segment dict** (`db.add_play_segment` / `query_play_segments`):
159     `{id:int, video_id, start_time:float, end_time:float, duration:float(end-start), server,
receiver, metadata:dict, events:[...]}`. Hybrid P4 metadata `{shot_count,
shot_count_confidence:'Unknown', detector:f'{family}-hybrid-{model}'}`; gemini detector = bare
`model_name`; motion adds random `intensity/avg_speed_kmh`.
160
161     $ **AI segment dict** (provider output, consumed by hybrid P3 / gemini): `{start_time,
end_time, shuttle_exchange_count?, shot_count_confidence?}` (offset by chunk/window start;
`_candidate_id` stamped internally).
162
163     $ **GT / golden CSVs** (TWO conventions ? do not conflate):
164     - generic (`annotations.load_annotations`): `start,end` 2-col; optional header; decimal
or MM:SS/HH:MM:SS; RAISES on bad row.
165     - golden/slicer (`calibrate_wasb.load_golden_gts`, `rally_slicer.load_rally_labels`,
`export.SEG_FIELDS`): `rally_number,start_time,end_time[,duration,start_mmss,end_mmss]`;
SILENTLY skips bad rows.
166
167     $ **det_raw.jsonl** (one window/line): `{ "w":<window_index>,
"f":[[frame_id,[x,y,score,scale],...], ...]}`. Lines MUST be contiguous (line N has `w==N`);
first violation/JSONDecodeError -> truncate-heal.
168     $ **manifest.json** (cache): `{version, frames_dir(abspath), weights, sport, frames_in,
frames_total, windows_total, windows_done}`. Reuse only if ALL match + `version==CACHE_VERSION`.
169     $ **collector manifest.json** (eval): `{eval_sets:[{video_id(label), local_path, csv,
...}]}`; ? DB key = file MD5, manifest `video_id` is a label.
170
171     $ **eval primitives**: `Interval=Tuple[float,float]` (start<end).
`Match{pred_index,gt_index,iou}`. `MatchResult{matches, unmatched_pred_indices(=FP),
unmatched_gt_indices(=FN)}`. `Score{iou_threshold,num_pred,num_gt,true_positives,false_positives
,false_negatives,precision,recall,f1,mean_iou,mean_start_error,mean_end_error}.as_dict()`.
172
173     $ **WSL detector candidate** (in-WSL, model-<->tracker): `{ 'xy':np.array([x,y]),
'score':float, 'scale':int}`; plain JSON form `[x,y,score,scale]`. ? `_dets_to_tracker` MUST
rebuild `xy` as np.array (tracker does `np.linalg.norm`).
174
175     ---
176
177     ## 4. WASB WSL CONTRACT (external dep `~/models/WASB-SBDT`, MIT; NOT in this repo ?
claims below are unverified against external source, only the repo-side caller wasb_infer.py was

```

```

checked)
178     - Env: WSL conda `wasb`, cwd `~/models/WASB-SBDT/src`. Hydra
`compose(config_name='eval', overrides=[dataset=<sport>, model=wasb,
detector.model_path=<weights>, runner.device=cuda, runner.gpus=[0]])`. `gpus=[0]` because box is
single-GPU. (overrides VERIFIED in @backend/detectors/wasb_infer.py::_build_cfg.)
179     - `model=wasb` -> `name=hrnet`, `frames_in=3`, `frames_out=3`, input 512x288 (WxH),
ImageNet normalize; affine resize maps heatmap coords -> original-frame coords. (model dims read
from cfg["model"] at runtime in wasb_infer.run.)
180     - `detectors/detector.py::TracknetV2Detector.run_tensor(imgs, affine_mats) -> (results,
hms_vis)`. `results[bid][eid]` = list of `{xy:np.array (ORIGINAL coords), score, scale}`.
(caller uses `detector.run_tensor(imgs, trans)` returning `(batch_results, _)` ? consistent.)
181     - `trackers/online.py::OnlineTracker` ? STATEFUL, sequential per `update()` (assumes
every frame fed once, in order, no gaps). `update(frame_dets)->{x,y,visi,score}`; `refresh()`
resets. `det['xy']` MUST be np.array. Full ordered re-run is deterministic. (caller calls
`build_tracker(cfg)`, `tracker.refresh()`, `tracker.update(...)` returning dict with `visi/x/y`
? consistent.)
182     - `dataloaders/dataset_loader.py::ImageDataset(cfg, samples, input_wh, output_wh,
transform, seq_transform, is_train)`; `samples=[{frames:[paths], annos:[{frame_path,
center:Center(is_visible,x,y)}]]`. (caller constructs exactly this ? VERIFIED in
wasb_infer.run.)
183     - Weights `pretrained_weights/wasb_badminton_best.pth.tar` ? NOT committed, academic-
data-trained -> ? confirm terms before COMMERCIAL deploy. monotrack weights = noncommercial,
avoided.
184
185     ---
186
187     ## 5. CROSS-REPO (sibling private repo `sports-data-collector` ? external, unverified
here)
188     - Indexer keys video by **FILE MD5**; collector keys by human `video_id`. ? re-
encoding/re-downloading changes bytes -> MD5; acquisition MUST precede processing; manifest
tracks the exact file used.
189     - `python -m src.cli.curate export` (collector) -> `<out>/<sport>/<video_id>.csv`
(indexer `start,end` format) + `manifest.json` -> consumed by `@backend/eval/batch.py` +
`@run_phase3_eval.py`.
190     - Collector also emits golden rally labels (`rally_number,start_time,end_time,...`) ->
consumed by `@backend/eval/calibrate_wasb.py` / `export_wasb_segments.py` /
`@backend/tools/rally_slicer.py`.
191
192     ---
193
194     ## 6. GOTCHAS (cross-cutting footguns)
195     - **MD5 keying:** `video_id` = MD5 of WHOLE file everywhere ? but each entrypoint uses a
different chunk SIZE (64KB/1MB/8KB); values agree, code does not. Manifest `video_id` is a
label, NOT the DB key.
196     - **Three default segmenters:** config.json `gemini` vs setup.py `yolo_hybrid` vs
main.py `motion`. You may run a different detector than expected.
197     - **Gemini free-tier / API-key dead path:** hybrids + gemini return `[]` (not error) if
`{PROVIDER}_API_KEY` missing OR WSL healthcheck fails ? a silent no-op for callers.
`analyze_video` also returns `[]` on real failure -> empty != "no rallies".
198     - **fps / frame_width must be PROBED not assumed:** `_probe_fps_width` / runner
fallbacks (30.0, 1280.0) silently mis-scale velocity thresholds if probing is skipped;
calibrate_wasb CLI bakes `59.94/1920`.
199     - **WSL `/mnt` can't see Google Drive / network mounts;** stage video into native WSL fs
(`~/clips`) ? `/mnt/c` reads are slow and Drive-backed paths invisible.
200     - **ffmpeg NOT in WSL** by design: all ffmpeg/ffprobe run Windows-side (must be on
PATH); WSL only runs the GPU model. `extract_frames` uses cv2 PNG (slow) ? prefer host ffmpeg +
`--frames_dir`.
201     - **GPU float nondeterminism:** detector pass is checkpointed/resumable but not bit-
reproducible; the CPU tracker re-run over the ordered cache IS deterministic.
202     - **`output/` is gitignored:** DB, baselines, cache, reels live there. Predictions MUST
exist in `output/<db_name>` before any eval/regression.
203     - **Validator ordering coupling:** exec order is Format -> ResolutionFPS ->
PTSContinuity -> SceneCut -> Blur -> Relevance; `resolution_fps_check` hard-fails unless
`format_check` ran earlier (shared `context['ffprobe_meta']`).
204     - **`add_video` INSERT OR REPLACE + FK CASCADE** -> re-ingesting a `video_id` cascade-

```

```

deletes its segments. Use `clear_video_data` deliberately.
205     - **Twin segmenters:** `wasb_hybrid.py` / `tracknet_hybrid.py` are copy-paste; fixes to
P3/P4 must land in both.
206     - **Two "annotations" modules:** `backend.eval.annotations` (GT CSV loader) vs
`backend.annotations` (provider registry). regression.py imports the latter.
207     - **Hardcoded tuned constants:** `calibrate_wasb.BASELINE`, `export.TUNED`,
slicer/compiler padding ? duplicated by copy, not import; re-tuning won't propagate.
208     - **`timeout_sec=0` = no timeout:** a hung WSL/GPU call blocks forever.
209     - **Stitch concat assumes identical encode:** per-clip re-encode then `-c copy` concat;
if probe fails (0.0) no boundary validation.
210
211     ---
212
213     ## 7. RAMP PATHS (to do X -> open Y::symbol)
214     | Task | Open |
215     |---|---|
216     | Tune candidate windowing (velocity/merge/min-dur) |
`@backend/detectors/tracknet_runner.py::trajectory_to_action_windows`; cfg `config.json
indexing.{wasb,tracknet}.velocity_threshold`, `dead_time_merge_gap`,
`min_action_window_duration` |
217     | Add a segmenter | subclass `@backend/indexer/base.py::BasePlaySegmenter`;
`segmenter_registry.register(...)` at module bottom; import in `@backend/indexer/__init__.py` |
218     | Change stitching padding | `config.json stitching.{begin_padding,end_padding}`; impl
`@backend/stitcher/compiler.py::VideoCompiler.compile_highlights`; mirror
`@backend/tools/rally_slicer.py::BEGIN_PADDING/END_PADDING` |
219     | Add a sport | subclass `@backend/sports/base.py::SportProfile`;
`sport_registry.register(...)` in `@backend/sports/__init__.py`; define prompt+HSV in new file |
220     | Add an AI provider | subclass `@backend/providers/base.py::AIVideoProvider`;
`provider_registry.register('name', Cls)` |
221     | Add an annotation/GT tier | subclass
`@backend/annotations/base.py::AnnotationProvider`; register + import in
`@backend/annotations/__init__.py` |
222     | Run calibration (WASB thresholds) | `@backend/eval/calibrate_wasb.py::main`
(`--trajectory --labels --fps --frame-width`); trust `cv` recall not `fit` |
223     | Export tuned rally segments / clips | `@backend/eval/export_wasb_segments.py::main`
(`--slice` needs `--video`) |
224     | Run a video end-to-end | `@backend/main.py::main` (`--video-path` or `--server`) or
`@run_process_and_stitch.py::main` (edit hardcoded paths) |
225     | Score DB preds vs GT (one video) | `@run_eval.py::main` |
226     | Batch score a collector manifest | `@run_phase3_eval.py::main` (`--manifest`) |
227     | Guard a regression (CI) | `@run_regression.py::main` (`--video-id`); exit 1=regress,
2=missing DB; snapshot via `--update-baseline` |
228     | Resume a crashed WASB pass | nothing to do ? `@backend/detectors/wasb_infer.py::run`
auto-resumes from `det_raw.jsonl`+`manifest.json` next to `--out`; `--fresh` forces restart;
cache invalidates on weights/sport/frames change |
229     | Add a validator | subclass `@backend/validators/base.py::VideoValidator`;
`registry.register(instance)` in `@backend/validators/__init__.py` (mind order; producers before
consumers) |
230     | Add a DB column/table | `@backend/database.py::Database._init_db` migration ladder +
bump `PRAGMA user_version` (else version-assert tests fail) |
231     | Train the learned segmenter | `@backend/eval/training.py::build_training_set` ->
`@backend/eval/classifier.py::LogisticRegression.fit/save` |
232
233     ---
234
235     ## 8. TEST MAP (`tests/test_*.py` -> subsystem)
236     | Test | Covers |
237     |---|---|
238     | `test_base.py` | `indexer.base.SegmenterRegistry` (register/get/list via
DummySegmenter) |
239     | `test_yolo_hybrid.py` / `test_tracknet_hybrid.py` | hybrid segmenters (yolo
torchvision+ByteTrack; tracknet 4-phase) |
240     | `test_gemini.py` | `indexer.gemini.GeminiPlaySegmenter` (parse/validate/chunk) |
241     | `test_tracknet_runner.py` | `detectors.tracknet_runner` parse_trajectory_csv +
trajectory_to_action_windows (shared brain) |

```

```

242 | `test_wasb_cache.py` | `detectors.wasb_infer` resumable cache (serialize, contiguity
heal, manifest invalidation, atomic writes) |
243 | `test_eval_metrics.py` | `eval.metrics` IoU/matching/score/pr_curve |
244 | `test_eval_annotations.py` | `eval.annotations` GT CSV parse/validate |
245 | `test_eval_harness.py` | `eval.harness` DB-pred fetch + evaluate + report_to_dict |
246 | `test_eval_batch.py` | `eval.batch` path resolve / stage select / aggregate |
247 | `test_calibration.py` | `eval.calibration` kfold/select_best/cross_validate/LOVO |
248 | `test_calibrate_wasb.py` | `eval.calibrate_wasb` CLI/run/grid |
249 | `test_export_wasb_segments.py` | `eval.export_wasb_segments` segment+comparison export

orchestrators, `wasb_runner`, `wasb_hybrid`/`tracknet_hybrid` (covered indirectly) ?? exercised
only indirectly |
261

```

205. assistant (2026-06-06T15:34:20.391Z)

This is exactly the artifact ? dense, anchor-rich, and the verify pass paid off (caught the validator-order and `indexing.wasb` errors, and honestly flagged Sections 4?5 as "external, unverified here" rather than asserting things it couldn't check). It even self-documents my checkpointing work in the ramp paths.

Let me land it as a docs PR and wire it into the ramp-up kit so future-me reads it first.

206. user (2026-06-06T15:34:37.477Z)

```

Switched to a new branch 'docs/code-map'

```

207. assistant (2026-06-06T15:34:47.529Z)

PR #27 is up. Now wiring it into memory so future-me reads it first for code ramp-up.

208. assistant (2026-06-06T15:34:51.362Z)

```

---
name: code-map-artifact
description: Where the dense cold-start CODE MAP of the indexer lives ? read it FIRST to ramp up
on codebase structure instead of crawling files
metadata:
  type: reference
---

```

For **code/architecture ramp-up** on `badminton-highlight-indexer`, read **docs/CODE_MAP.md** in

the repo FIRST ? a dense, anchor-rich (`@path::symbol`), machine-first map: pipeline (runtime + calibration/eval), per-subsystem file/symbol index, canonical data contracts, WASB WSL boundary, cross-repo collector contract, cross-cutting gotchas, "to do X -> open Y" ramp paths, and a test->subsystem map. It replaces a DFS/BFS crawl of 40+ files.

- Landed via PR #27 (`docs/code-map`).
- **Regenerate** after any registry/contract/WSL-interface change by rerunning the `build-code-map` workflow (script saved under the session's `workflows/scripts/`): parallel subsystem readers -> synthesize -> adversarial verify (the verify phase re-checks every anchor against real files).
- Caveat baked into the doc: Sections 4 (WASB-SBDT) & 5 (collector) describe EXTERNAL repos and are unverified against their source ? only the repo-side callers were checked.
- This is for CODE structure (which is repo-derivable, hence a doc not a memory). Non-code project state stays in `[[current-state]]` / `[[session-handoff]]`.

209. user (2026-06-06T15:34:51.382Z)

File created successfully at: C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\code-map-artifact.md (file state is current in your context ? no need to Read it back)

210. user (2026-06-06T15:34:57.415Z)

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\MEMORY.md has been updated successfully. (file state is current in your context ? no need to Read it back)

27 docs: CODE_MAP.md ? dense cold-start navigation map docs/code-map OPEN
2026-06-06T15:34:38Z

215. assistant (2026-06-06T15:35:53.442Z)

Both background jobs are home, and the code map is shipped.

Code map ? [PR #27](https://github.com/avidullu/badminton-highlight-indexer/pull/27)

`docs/CODE\_MAP.md` is your cold-ramp artifact: ~260 dense lines, `@path::symbol` anchors throughout. Sections: pipeline (runtime + calibration/eval, with explicit STOP points), per-subsystem file/symbol index, canonical data contracts in one place, the WASB WSL boundary, the cross-repo collector contract, cross-cutting gotchas, a "to do X ? open Y" ramp table, and a

test?subsystem map.

The `map ? synthesize ? adversarial-verify` workflow is the part that makes it trustworthy ? 8 agents, ~621k tokens, and the verify phase **caught and fixed real errors** the synthesis would otherwise have baked in (wrong validator execution order, a `config.json indexing.wasb` block that doesn't exist, a bogus `extract\_yolo\_features` gotcha) and honestly tagged the external WASB/collector sections as unverified-against-source. It's regenerable: rerun `build-code-map` after any registry/contract/WSL-interface change.

Wired into memory so future-me uses it: `code-map-artifact.md` (reference) + a "read `docs/CODE\_MAP.md` FIRST for code" line in both `MEMORY.md` and the session-handoff ramp-up kit.

Status recap

- **Demo (tuned) segments** for Adarsh and Vasanth: delivered last turn ? 65 rallies / 251.4 s, `output/adarsh\_tuned\_segments.csv`. Baseline staged, held until you've anchored.
- **Open PR: #27 (code map)**. master clean.
- Both jobs done; the 7.9 GB `Temp\adarsh\_frames` + the trajectory copies are deletable whenever ? say the word and I'll clean them.

Whenever you're back from eyeballing the demo segments, tell me your read and I'll either fire the baseline side-by-side or tune `merge\_gap`/`min\_duration` to chase the short-segment noise.

216. user (2026-06-06T15:43:56.691Z)

can you run the baseline, which is without these tuned weights? And tell the %age improvement? I have eyeballed, some are really good rallies detected, but some have the pattern which I am documenting, now we are overfiring because it is detecting the player sending the shuttle to another for service after losing on an unforced error or missing the shuttle, is detected as a rally start. We need to identify a way to say "When both players are in "start stance i.e. one serving and one side receiving for singles or doubles" only then start a rally" or else it is overdetecting them. I know we are relying on a "shuttle trajectory" model so when the player send the shuttle by throwing it or hitting it by raquet, it probably shows up as a trajectory and gets detected. We need also a state i.e. "if rally end is detected, then again wait for the start stance rule" or something, probably needs some research now.

217. assistant (2026-06-06T15:45:09.933Z)

Two parts: the baseline run + honest comparison first, then the over-firing problem (which is the more interesting one, and you've put your finger on something real).

First a key clarification so the numbers mean what we think: there are **no "tuned weights"** here ? the WASB neural weights are identical in both runs. What differs is three **post-processing thresholds** (velocity / merge-gap / min-duration). And critically: **this video has no golden labels**, so I cannot compute a true precision/F1 "% improvement" for it ? that +26.8% F1 figure was measured against ground truth on the Sample Long Video. For Adarsh I can only give a descriptive baseline-vs-tuned delta. Let me run it.

218. user (2026-06-06T15:45:19.212Z)

BASELINE (0.02, 2.0, 2.0): 45 segments, 303.8s play, mean 6.8s
TUNED (0.05, 1.0, 1.0): 65 segments, 251.4s play, mean 3.9s
delta: tuned has +20 segments (+44%), -52.4s play (-17%)

overlap (IoU>=0.5): 35 shared
TUNED-ONLY (extra vs baseline) = 30 segs; durations: [1.0, 1.1, 1.2, 1.3, 1.3, 1.3, 1.3, 1.3, 1.4, 1.4, 1.5, 1.5, 1.6, 1.7, 1.7, 1.8, 1.8, 1.9, 2.3, 2.4, 2.6, 2.7, 2.9, 2.9, 3.0, 3.5, 3.8, 3.9, 4.3, 4.4]
BASELINE-ONLY (tuned merged/dropped) = 10 segs; durations: [2.3, 3.1, 3.3, 3.3, 7.6, 8.9, 9.2, 9.6, 10.9, 17.7]

TUNED short (<=2.0s, the suspected service-feed false fires): 19 of 65

219. assistant (2026-06-06T15:46:42.714Z)

Baseline's in, and the comparison is genuinely illuminating ? it confirms your eyeball diagnosis hard.

****Baseline (0.02/2.0/2.0) vs Tuned (0.05/1.0/1.0) on Adarsh ?**
``output/adarsh_baseline_segments.csv`:`

	segments	play time	mean len
Baseline	45	303.8 s	6.8 s
Tuned	65	251.4 s	3.9 s

Tuned is ****+20 segments (+44%)**** but ****?52 s play (?17%)****, and the structural diff shows **why** that's bad, not good:

- ****30 tuned-only segments****, durations almost all ****1.0?2.0 s**** (19 of 65 are ?2 s) ? these are your between-point service-feed false fires.
- ****10 baseline-only segments**** that tuned **lost** ? and they're the ****long rallies**** (17.7 s, 10.9 s, 9.6 s, 9.2 s, 8.9 s, 7.6 s). Tuned's ``merge_gap=1.0`` ****fragments real long rallies**** so they no longer survive as single segments.

So on the honest read: ****there's no "% improvement" here ? if anything tuned regresses on this video.**** No golden labels means I can't put a precision/F1 number on it, but the pattern is clear: the tuned thresholds were **overfit to the Sample Long Video** and don't transfer (this is exactly the ``leave_one_video_out`` caution made concrete). For Adarsh, ****baseline is the better operating point**** ? fewer false fires, long rallies kept whole.

****The over-firing problem ? your diagnosis is right, and there's a clean way to attack it.****

The data backs you: every false fire is a **short single trajectory** (the loser flicking/tossing the shuttle back for service registers as a 1?2 s "rally"). A real rally has the shuttle crossing the net ****multiple times****; a service feed crosses ****once****. That gives a spectrum of fixes, cheap ? robust, all grounded in what we already have:

- **** (A) Shuttle-only rally signature ? no new model, highest ROI.**** Gate each candidate on ****net/midline crossings ? K**** (? shot count) or trajectory direction-reversals, not just duration. A single toss = 1 crossing ? rejected; a real exchange = ?2?3 ? kept. Implementable purely on the WASB trajectory we already produce. This alone should kill most of the 30 false fires.
- **** (B) Your start-stance state machine ? uses the person detector we already have.**** WASB is shuttle-only, but the repo already ships a person detector (``yolo_hybrid``: torchvision Faster R-CNN + ByteTrack). At a legal serve both players are ****stationary and diagonally positioned**** in the service zones; between points they're ****moving**** (picking up the shuttle, repositioning). So: a state machine ``IDLE ? (await start-stance: players settled + diagonal) ? ARMED ? (shuttle trajectory) ? RALLY ? (rally end) ? IDLE``. A trajectory that fires while **not ARMED** is rejected. Efficient version: ****WASB proposes candidates cheaply; a stance-gate runs the person detector only in the ~2 s around each candidate start**** to accept/reject ? no full-video person pass needed (that path was ~50 min/video, which is why it was abandoned for proposal but is fine as a **verifier**).
- **** (C) Pose-based serve detection ? richest, new model + licensing review.**** Detect the actual serve posture. Highest fidelity, most cost; probably overkill unless A+B fall short.

My recommendation: ****A now**** (fast, kills the documented pattern, shuttle-only), with ****B as the robust target****. C only if needed. This needs a bit of research to do B right (how the badminton-CV literature ? ShuttleSet, TrackNet-adjacent work ? actually detects serves/rally boundaries), which is what you're sensing.

Let me capture this finding and then let you steer the next step.

220. user (2026-06-06T15:46:53.040Z)

The file `C:\Users\avidu\claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md` has been updated successfully. (file state is current in your

context ? no need to Read it back)

221. user (2026-06-06T15:50:42.450Z)

Your questions have been answered: "How do you want to attack the over-firing next?"="Taking your recommendation. A now B as the robust target. Additionally, I want you to also ponder that "I am willing to slice videos and use paid Gemini and keep the cost very low i.e. videos <1GB" if that can help us build a "stronger" baseline for now rather than spending a lot of time fine tuning. Although by next week we will have more annotated videos but in real world users we should keep in mind that having Gemini video processing or other AI platform video analysis as a "calculated a bit-expensive but quality significantly improving" fallback.". You can now continue with these answers in mind.

222. assistant (2026-06-06T15:52:17.721Z)

Taking your steer: ****building gate A now****, B is the robust target, and I'll genuinely ponder the paid-Gemini-fallback idea at the end (it's a good one and the architecture already leans that way).

Let me implement the shuttle-only crossing gate as a real, testable module and measure it on Adarsh.

223. assistant (2026-06-06T15:52:37.311Z)

""""Rally-start gate: suppress between-point false fires using shuttle net-crossings.

WASB (shuttle-only) over-detects: when a player flicks/tosses the shuttle back to the opponent for service after losing a point, that single trajectory looks like a rally. The discriminator is structural, not duration-based: a real rally has the shuttle crossing the net MULTIPLE times (each shot lands on the other side); a single service feed crosses ~once.

This module is camera-agnostic and needs NO new model ? it works on the trajectory we already produce (Frame,Visibility,X,Y). It estimates the play axis (the image axis with the larger shuttle spread) and the net position (median shuttle coord on that axis ? the shuttle clusters at the two ends and crosses the net region often, so the median sits near the net), then counts sign changes of (coord - net) across the visible points inside a candidate window, with a deadband to ignore jitter.

Gate A in the over-fire fix spectrum (B = player-stance state machine, future). Pure functions only ? no I/O, unit-tested; intended as a post-filter on the windows from trajectory_to_action_windows, or to fold into it later.

K>=3: keep 29/65 (174s) | kills 19 short(<=2s) + 2 long(>4s)

wrote output/adarsh_baseline_gated.csv : BASELINE+gate(K=2) = 38 segments

231. assistant (2026-06-06T15:54:24.862Z)

The gate works. Quick read of the numbers:

- **Camera is side-on** here (play axis = X, net at x?716) ? the gate auto-detected that, so it's not baked to one camera angle.
- **Crossing count cleanly separates real rallies from false fires:** long rallies score 5?13 crossings; the junk scores 0?1.
- **On TUNED:** `K?2` kills **18 of the ~19 short (?? s) false fires** ? exactly your service-feed pattern, gone.
- **On BASELINE:** it was already cleaner (min-duration 2.0 suppressed shorts), so the gate trims 7 low-crossing windows ? **38 segments, 282 s**.

I wrote **`output/adarsh\_baseline\_gated.csv`** (Baseline + gate K?2, 38 segments) as the candidate "stronger baseline." Let me show you exactly which segments the gate removed so you can sanity-check it's cutting junk, not rallies:

232. user (2026-06-06T15:54:31.820Z)

REMOVED by gate (baseline windows with <2 net-crossings) ? eyeball these:

0:00.450-0:03.537 (3.1s) crossings=1 vis_pts=14
0:16.099-0:18.252 (2.2s) crossings=1 vis_pts=107
2:30.317-2:32.569 (2.3s) crossings=0 vis_pts=18
4:02.375-4:06.179 (3.8s) crossings=1 vis_pts=190
4:39.546-4:44.718 (5.2s) crossings=1 vis_pts=213
8:51.514-8:53.833 (2.3s) crossings=1 vis_pts=110
9:51.708-9:54.994 (3.3s) crossings=0 vis_pts=28

KEPT (sample of strongest):

4:14.037-4:27.634 (13.6s) crossings=13
7:39.292-7:56.943 (17.7s) crossings=13

```
2:49.386-3:08.004 (18.6s) crossings=11
7:08.628-7:21.524 (12.9s) crossings=11
2:05.492-2:14.101 (8.6s) crossings=7
4:52.909-5:03.053 (10.1s) crossings=7
```

233. assistant (2026-06-06T15:55:20.329Z)

This is a clean win: the ****strongest rallies score 11?13 crossings**** (kept), and the ****7 removed baseline windows are 0?1 crossings**** ? start-of-clip junk (0:00), brief between-point blips, and shuttle-stays-one-side non-rallies (2:30 and 9:51 at 0 crossings). The one to actually eyeball is ****4:39.5?4:44.7 (5.2 s, 1 crossing)**** ? long-ish but one-sided, so either a real rally the gate wrongly cut or a long non-rally; your eyes decide.

Let me wire the gate into the export tool as a CLI option (so it's reproducible, not a one-off), then ship it.

234. user (2026-06-06T15:55:22.569Z)

PR #28 is up (gate A shipped). Let me log it + the strategic direction, then give you the Gemini ponder you asked for.

251. assistant (2026-06-06T15:58:46.155Z)

****Gate A is shipped**** ? [PR #28](<https://github.com/avidullu/badminton-highlight-indexer/pull/28>), `output/adarsh\_baseline\_gated.csv` is your "stronger baseline now" (45?38, junk removed, all long rallies kept). One window to eyeball: 4:39.5?4:44.7. master clean, suite 193 green.

****Pondering the paid-Gemini-as-fallback idea ? it's a good instinct, and the architecture is already shaped for it.****

The key thing you may not realize: ****the hybrid pipeline already does exactly the cost-bounded thing you're reaching for.**** `wasb\_hybrid` Phase 3 doesn't send the whole video to Gemini ? it sends ***only the padded candidate clips*** (one short clip per WASB candidate window). So the Gemini bill scales with ****#candidates × clip-length, not video duration.**** It "died" earlier purely on free-tier quota (20 req/day), not on architecture. A paid key revives it as-is ? you don't even need to pre-slice the whole video to <1 GB; the candidate clips are 2?15 s each, far under any upload limit. (The <1 GB instinct still matters if you ever hand Gemini a ***whole*** match.)

So the cost-optimal stack writes itself, and gate A makes it cheaper:

> ****WASB proposes**** (cheap, recall-first) ? ****gate A**** (free, removes the obvious junk ? ***fewer Gemini calls***) ? ****Gemini verifies the survivors**** (paid, precision + tightens boundaries + can reject a between-point feed because it actually ***sees*** it's not a rally).

Gate A and Gemini aren't competing ? A shrinks the Gemini bill. On Adarsh that's ~38 short clips to verify instead of 65+, i.e., a modest per-video cost (bounded by clip count, not the 11-minute runtime). "Calculated bit-expensive," exactly your framing.

Two strategic angles worth separating:

1. **Stronger baseline now** (before next week's human labels): point paid Gemini at your **owned** test videos (Adarsh et al.) to generate a **silver ground-truth** cheaply. That gives you something the threshold-tuning is currently flying blind without ? an actual precision/recall number on this video ? so we can **measure** gate A and the thresholds instead of eyeballing. Caveat from your own oracle rule ([[golden-set-vendoring]]): an auto-labeler must be a **different lineage** than production ? Gemini vs WASB qualifies, so it's a legitimate independent oracle, but treat its labels as **silver**, not gold. Next week's human annotations stay authoritative; Gemini is the bridge until then.

2. **Product fallback tier (real users)**: here's the one tension to hold ? sending user video to Gemini **breaks the privacy lever** you'd banked on ([[monetization-plan]]: "vendors/AI never see user uploads"). So the clean design is **default = CV-only (WASB + gate A): private, fast, cheap**; **premium/opt-in = + Gemini verification: higher quality, costs money, leaves your infra**. That keeps the privacy promise as the default and makes AI a **consented** quality upgrade ? which is also a natural pricing boundary.

Concrete next step I can take (needs a paid `GEMINI_API_KEY`` in env from you): wire and run the **gate-A ? Gemini-verify** path on the Adarsh candidates. You'd get (a) a sharper Adarsh segment set immediately, and (b) a silver-GT to actually quantify gate A's precision/recall before the human labels land. Say the word and set the key, and I'll build it. Otherwise I'll hold Gemini for the tier design and we let gate A + next week's golden videos drive the numbers.

Open PRs to merge when you're ready: **#27** (code map), **#28** (gate A).

252. user (2026-06-06T15:58:48.755Z)

ok So if you put min duration as 5 seconds, then I would like that in a separate csv to eyeball because I noticed the longer rallies are always getting well detected.

253. assistant (2026-06-06T15:59:17.235Z)

On it. I'll use the baseline velocity/merge (0.02/2.0) ? which keeps long rallies **whole** (tuned's merge-gap 1.0 fragments them, so it'd wrongly drop a long rally split into sub-5s pieces) ? with a **5 s minimum duration**, into its own CSV.

254. user (2026-06-06T15:59:19.483Z)

```
=== WASB tuned-segment export ===
tuned cfg (0.02, 2.0, 5.0): 29 rally segments, 255.5s of play ->
output/adarsh_min5s_segments.csv
```

255. user (2026-06-06T15:59:23.318Z)

28 9:32.7?9:40.3 (7.6)   29 9:57.2?10:06.1 (8.9)
...
```

This is the high-precision view ? exactly the long rallies you said are reliably detected (6 of them are 10?18.6 s).

One useful cross-reference: ****rally 15 (4:39.5?4:44.7, 5.2 s)**** is the same window gate A flagged as suspicious (only ****1 net-crossing**** ? shuttle stayed one side). So it's the single segment in this 5 s set where the two methods disagree: the duration floor keeps it, the crossing gate would drop it. If you scrub one thing, scrub that ? it'll tell us whether "long but one-sided" is a real rally (gate A too aggressive) or a long non-rally (duration floor too trusting).

Everything else here should be solid. This is a gitignored output artifact, so nothing to commit. Want me to also produce the ****5 s floor + gate A combined**** version (would drop rally 15) so you can A/B the two filters side by side?

257. user (2026-06-06T16:14:58.906Z)

Before anything else: I'll treat that string as a live secret ? I won't write it to any file,

commit it, or save it to memory; I'll pass it to the process via an env var only, transiently.

Heads-up on authenticity: that string (`AQ.Ab8?`) doesn't match the usual Google AI Studio Gemini key shape (those start with `AIza?`), so it may be an OAuth token rather than an API key ? but I won't assume, I'll just test it. Let me check how our existing provider authenticates so I verify it the same way the pipeline would.

262. assistant (2026-06-06T16:16:56.055Z)

Our provider uses the `google-genai` SDK with `genai.Client(api\_key=...)`. Let me verify the key against that exact path ? a minimal `models.list()` auth check (key passed via env, not printed).

263. user (2026-06-06T16:17:04.261Z)

```
key shape: prefix AQ. len 53
AUTH OK ? models visible: 54
flash models: ['models/gemini-2.5-flash', 'models/gemini-2.0-flash',
'models/gemini-2.0-flash-001', 'models/gemini-2.0-flash-lite-001', 'models/gemini-2.0-flash-
lite', 'models/gemini-2.5-flash-preview-tts']
```

264. assistant (2026-06-06T16:18:27.059Z)

****Key works**** ? auth OK, 54 models visible including `gemini-2.5-flash` (the `AQ.` prefix is fine, just an unusual format). I'll keep it transient (env var only, never written to disk).

Now, "without reinventing the wheels" ? we already have a registered `gemini` segmenter that chunks a video and detects rallies. Let me read it to decide the cleanest path: run it directly (pure-Gemini, full context) vs. drive the existing GeminiProvider over WASB candidates (verify/refine). I want to reuse, not rebuild.

265. user (2026-06-06T16:18:27.586Z)

266. assistant (2026-06-06T16:19:54.691Z)

Key verified and the `gemini` wheel exists. Given your "keep cost very low" + the actual goal (improve WASB on Adarsh), the smartest reuse is ****WASB candidates ? Gemini verify/refine****: the existing `GeminiProvider` + badminton prompt + `extract\_video\_chunk` driven over the short WASB candidate clips (?450 MB total upload vs ~6 GB if I chunked the whole 5.5 GB video ? and it directly fixes the precision/over-fire problem). Let me confirm the exact `extract\_video\_chunk` signature, then write a thin driver that reuses these pieces.

267. user (2026-06-06T16:19:55.393Z)

268. assistant (2026-06-06T16:20:26.287Z)

Signatures confirmed. Writing the thin refine driver ? it reuses `provider\_registry`, `sport\_registry`, `extract\_video\_chunk`, `make\_predict\_fn`, and `write\_segments\_csv` (no new Gemini/prompt/windowing logic), with a `--limit` so I can smoke-test a few candidates before spending the full run.

269. assistant (2026-06-06T16:20:40.752Z)

"""Refine WASB rally candidates with Gemini (verify boundaries + reject false fires).

WASB (shuttle-only) over-fires on between-point service feeds. This drives the EXISTING Gemini provider over the SHORT WASB candidate clips (not the whole video): each candidate window is cut to a small padded clip and handed to Gemini, which ? seeing the actual footage ? returns the true rally inside it (tight boundaries) or nothing (it was a toss / dead time). Cheap because uploads are seconds-long clips, not GB-scale chunks; high-precision because Gemini judges each candidate visually.

Reuses (no reinvented wheels): providers.GeminiProvider (via provider_registry), sports.badminton.prompt (sport_registry), utils.video.extract_video_chunk, calibrate_wasb.make_predict_fn, export_wasb_segments.write_segments_csv.

This mirrors wasb_hybrid's Phase-3 handoff but runs standalone on a cached trajectory (no WASB re-run, no DB) ? an eval/tuning driver, not the live pipeline.

```

Run (GEMINI_API_KEY in env):
python -m backend.eval.gemini_refine --video Adarsh.MP4 --trajectory adarsh_traj.csv \
    --fps 59.94 --frame-width 1920 --out output/adarsh_gemini.csv [--limit 4]

3/3 pass. Now the smoke test ? 4 candidates through real Gemini to confirm the clips upload and Gemini returns sane rallies before I spend the full run.

276. user (2026-06-06T16:22:12.127Z)

```
[gemini_refine] 4 WASB candidates (cfg (0.02, 2.0, 2.0)) -> Gemini gemini-2.5-flash, pad 3.0s, 4 workers
[Gemini cand0] Upload failed: [WinError 10053] An established connection was aborted by the software in your host machine
  cand  0 0:00.450-0:03.537 -> REJECT (no rally)
  cand  1 0:16.099-0:18.252 -> 0:17.099-0:19.099
  cand  3 0:37.170-0:47.331 -> 0:38.670-0:40.170 0:45.470-0:46.670
  cand  2 0:21.305-0:27.528 -> 0:21.505-0:27.305
[gemini_refine] 3/4 candidates had a rally; 2 merged rallies, 7.8s play ->
output/adarsh_gemini_smoke.csv (47s)
```

277. assistant (2026-06-06T16:23:35.149Z)

Smoke test caught two real things before I spent the full run ? exactly why I ran it:

1. ****A transient upload failure**** (`WinError 10053`) killed cand 0 ? the provider has no upload retry.
2. ****More important: Gemini fragments a long rally in a short clip.**** Cand 3 (a real 10.2 s rally) came back as two ~1.5 s pieces, which `min\_dur` then **dropped entirely** ? i.e., the naive per-candidate approach can lose good long rallies (the ones WASB nails).

Both are fixable cheaply. Fix (1): add upload retry to the existing provider (a real robustness win, not a workaround). Fix (2): since each WASB candidate ? one rally, take the ****envelope**** (min-start?max-end) of Gemini's segments per candidate instead of treating fragments as separate rallies. Let me apply both.

```

283. assistant (2026-06-06T16:26:08.972Z)

Envelope works (cand 3 is one clean rally now), but two more transient failures surfaced: a ****503 "model overloaded"*** on the generate call (not retried ? caused a false reject), and a socket error that smells like the ``genai`` client not being thread-safe across the 4 workers. Both would punch holes in the full run. Fixes: retry the generate call too, and give each worker its own client. Worth nailing before spending 45 calls.

284. user (2026-06-06T16:26:15.692Z)

cand 4 0:50.183-0:59.376 -> REJECT (no rally)
```

```
cand 5 1:02.296-1:05.616 -> REJECT (no rally)
cand 3 0:37.170-0:47.331 -> REJECT (no rally)
[gemini_refine] 2/6 candidates had a rally; 1 merged rallies, 4.5s play ->
output/adarsh_gemini_smoke.csv (97s)
```

291. assistant (2026-06-06T16:29:06.176Z)

The blocker now is server-side: `gemini-2.5-flash` is returning 503 "high demand" repeatedly right now (cand 3/4/5 exhausted retries ? false rejects, including the good 10 s rally). That's capacity, not our code. Fix: switch to `gemini-2.0-flash` (also in your model list ? solid video model, more available, cheaper) and ease workers to 2.

292. user (2026-06-06T16:31:12.738Z)

```

293. assistant (2026-06-06T16:31:33.831Z)

`gemini-2.0-flash` is 404 (deprecated for generation even though it's listed). `gemini-2.5-flash` works but hits 503 spikes. Let me check which models actually support generation and pick a less-congested one (e.g. flash-lite) before retuning retries.

294. user (2026-06-06T16:31:41.201Z)

295. assistant (2026-06-06T16:32:02.166Z)

There are far newer models on this account than my training cutoff knew ? `gemini-flash-latest`,
`gemini-3.5-flash`, etc. The 503 was specific to the congested `2.5-flash`. Let me smoke
`gemini-flash-latest` (current stable flash, good for video, less likely throttled).

296. user (2026-06-06T16:33:46.925Z)

```
[gemini_refine] 6 WASB candidates (cfg (0.02, 2.0, 2.0)) -> Gemini gemini-flash-latest, pad  
3.0s, 2 workers  
cand 1 0:16.099-0:18.252 -> 0:15.599-0:18.399  
cand 0 0:00.450-0:03.537 -> 0:00.000-0:01.500  
cand 2 0:21.305-0:27.528 -> 0:23.805-0:25.805  
cand 3 0:37.170-0:47.331 -> 0:37.370-0:46.670  
cand 4 0:50.183-0:59.376 -> 0:49.683-0:59.983  
cand 5 1:02.296-1:05.616 -> 1:01.796-1:04.296
```

[gemini_refine] 6/6 candidates had a rally; 5 merged rallies, 26.9s play -> output/adarsh_gemini_smoke.csv (97s)

297. assistant (2026-06-06T16:34:11.364Z)

****`gemini-flash-latest` works cleanly**** ? 6/6 candidates returned rallies, no 503s, envelope keeps the long rally (cand 3) whole, and Gemini tightened boundaries (e.g. cand 2: WASB's 21.3?27.5 ? actual play 23.8?25.8). ~16 s/candidate. Let me set it as the driver default and launch the full baseline run (45 candidates) in the background.

298. user (2026-06-06T16:34:13.288Z)

96: cfg=BASELINE, pad: float = 3.0, model: str = "gemini-flash-latest",
151: ap.add_argument("--model", default="gemini-flash-latest")

299. assistant (2026-06-06T16:34:21.830Z)

Default set. Launching the full baseline run (45 candidates) in the background ? I'll be notified when it lands (~4?6 min), and you can "tail" anytime.

300. user (2026-06-06T16:34:25.106Z)

Command running in background with ID: bkap9jri2. Output is being written to:
C:\Users\avidu\AppData\Local\Temp\claude\C--Users-avidu-Projects-badminton-highlight-indexer\42211f80-2169-4025-ad9d-99c1aa29ff70\tasks\bkap9jri2.output. You will be notified when it completes. To check interim output, use Read on that file path.

301. assistant (2026-06-06T16:34:31.215Z)

While that runs, let me confirm the whole suite is green with the provider + new-module changes.

302. user (2026-06-06T16:34:49.717Z)

```
..... [ 37%]  
..... [ 75%]  
..... [100%]  
190 passed in 14.17s
```

303. assistant (2026-06-06T16:35:12.575Z)

190 green (= master's 187 + 3 new `gemini\_refine` tests; gate A's 6 tests live on the unmerged PR #28 branch ? these are independent PRs). The provider retry change and new driver are working-tree, uncommitted; I'll PR them once the full run validates end-to-end.

Let me log the useful model finding to memory while the run works (I will ****not**** store the key ? secret stays out of memory/disk).

304. user (2026-06-06T16:35:23.547Z)

The file C:\Users\avidu\claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md has been updated successfully. (file state is current in your context ? no need to Read it back)

305. assistant (2026-06-06T16:35:35.761Z)

Status ? the Gemini tuning is built, hardened, and running:

****Built (reusing existing wheels, no reinvention):**** `backend/eval/gemini\_refine.py` drives the existing `GeminiProvider` + badminton prompt + `extract\_video\_chunk` over the short WASB candidate clips. The smoke tests caught and fixed three real issues before the full spend: upload retries, generate-call retries for 503s, per-worker clients (thread-safety), and the ****envelope**** fix so Gemini fragments don't shatter a long rally.

****Model finding worth keeping:**** `2.5-flash` is throttling hard (503s), `2.0-flash` is 404'd ?
`gemini-flash-latest` runs clean. Saved to memory (key itself never stored).

****Running now**** (`bkap9jri2`, ~426 min): all 45 baseline WASB candidates ? Gemini ?
`output/adarsh\_gemini\_refined.csv`. When it lands I'll:
1. show you the refined rally list (the "tuned Adarsh"),
2. score WASB baseline / baseline+gate ****against**** the Gemini result (Gemini as a silver ground-truth ? finally a precision/recall number for Adarsh),
3. PR the `gemini\_refine` driver + provider retries.

One honest caveat carried forward: recall is capped by WASB's candidates ? Gemini refines/rejects what WASB proposed but can't recover a rally WASB never flagged. "tail" anytime for progress; otherwise I'll report when it completes.

306. user (2026-06-06T16:35:37.537Z)

But do remember that keep the videos to be uploaded <500 MB because it has a 2GB limit
do update the default gemini model to the best you find so that we dont start from 2.5 and
failover to 2 all the time

307. assistant (2026-06-06T16:36:16.491Z)

Two good guardrails. Let me check the running job's progress, then test the newest model to pick
a concrete "best" default (and I'll add a <500 MB upload guard either way).

308. user (2026-06-06T16:36:19.815Z)

```
=== full-run progress (bkap9jri2) ===  
7  
  cand  3 0:37.170-0:47.331 -> 0:37.370-0:46.670  
  cand  4 0:50.183-0:59.376 -> 0:49.683-0:59.983  
  cand  6 1:08.352-1:16.126 -> 1:08.152-1:14.352
```

309. assistant (2026-06-06T16:37:23.849Z)

The full run is mid-flight (7/45, clean on `gemini-flash-latest`) ? I won't disturb it. Let me
add the <500 MB upload guard centrally in the provider (protects every upload path; our
candidate clips are a few MB so they're already safe, but this enforces it), and verify the
newest model so I pin a concrete best default.

310. user (2026-06-06T16:37:24.682Z)

```
1      import time  
2      import json  
3      import logging  
4      from typing import Tuple  
5      from google import genai  
6      from google.genai import types

been updated successfully. (file state is current in your context ? no need to Read it back)

312. user (2026-06-06T16:37:45.276Z)

The file C:\Users\avidu\Projects\badminton-highlight-indexer\backend\providers\gemini.py has been updated successfully. (file state is current in your context ? no need to Read it back)

313. assistant (2026-06-06T16:38:05.319Z)

Now let me verify which models actually respond (grounding the "best" pick) ? a cheap text ping on the newest flash vs the alias vs the congested 2.5, low load so it won't disturb the video run.

314. user (2026-06-06T16:38:32.668Z)

```
gemini-flash-latest      OK (1.7s) 'ok'
gemini-3.5-flash         OK (1.4s) 'ok'
gemini-3.1-flash-lite    OK (10.9s) 'ok'
gemini-2.5-flash         OK (1.1s) 'ok'
```

315. assistant (2026-06-06T16:39:10.797Z)

All four respond for text (the 2.5-flash 503s were video-under-load, not auth). Decision on the default: I'll keep `gemini-flash-latest`. It's an alias Google points at the current best stable flash (the 3.x generation right now), so it auto-upgrades, never 404s/deprecates, and I already `video`-validated it clean ? which is exactly the "don't start from 2.5 and fail over" behavior you want. Pinning `gemini-3.5-flash` would be newer-concrete but reintroduces deprecation churn later; the alias is the better default. (It's already set as the driver default.)

Let me add a quick test for the size guard and confirm the suite's green.

316. user (2026-06-06T16:39:11.548Z)

```
1      import pytest
2      from unittest.mock import MagicMock, patch
3      from backend.providers.gemini import GeminiProvider
4
5      def test_gemini_provider_success():

63

```

317. assistant (2026-06-06T16:39:27.241Z)

The size guard returns before touching the client, so existing tests still pass (a non-existent "dummy.mp4" ? `getsize` errors ? treated as 0 MB). Let me add a guard test and run the provider suite.

318. user (2026-06-06T16:39:31.498Z)

The file C:\Users\avidu\Projects\badminton-highlight-indexer\tests\test_provider_gemini.py has been updated successfully. (file state is current in your context ? no need to Read it back)

319. user (2026-06-06T16:39:44.639Z)

```

..... [100%]
7 passed in 7.41s

```

320. assistant (2026-06-06T16:39:56.729Z)

Both handled:

1. ****<500 MB upload guard**** ? added `MAX\_UPLOAD\_MB = 500` in the provider; any clip over that is refused **before** upload with a clear "chunk smaller" error (the 2 GB API limit, with margin). Our candidate clips are a few MB so they sail through; this protects the whole-video chunking path too. Covered by a new test. 7/7 provider+refine tests green.

2. ****Default model**** ? locked to `gemini-flash-latest`. All four models answer text, but that alias is the one I video-validated clean (no 503s), and being an alias it tracks Google's current best flash and won't 404/deprecate ? so no more 2.5?2.0 failover churn. (`gemini-3.5-flash` also works if you ever want to pin newest-concrete.)

Let me peek at the full run's progress so you have a status:

321. user (2026-06-06T16:40:00.384Z)

```
candidates processed: 26/45
rejects so far: 0
--- last 3 ---
  cand 23 5:23.039-5:25.509 -> 5:21.039-5:24.539
  cand 24 5:28.428-5:32.065 -> 5:29.028-5:30.928
  cand 25 5:38.238-5:44.427 -> 5:39.438-5:43.238
--- done line (if any) ---
[gemini_refine] 45 WASB candidates (cfg (0.02, 2.0, 2.0)) -> Gemini gemini-flash-latest, pad
3.0s, 3 workers
```

322. assistant (2026-06-06T16:40:10.556Z)

Status: ****26/45 done, 0 failures, 0 rejects**** ? running clean on `gemini-flash-latest`.
Interesting early signal: Gemini is ***confirming*** the baseline candidates (with tightened boundaries like cand 23: WASB 5:23.0?5:25.5 ? Gemini 5:21.0?5:24.5) rather than rejecting them ? consistent with baseline being fairly clean already (the over-fires lived mostly in the ***tuned*** config's short windows, which baseline's 2 s floor suppressed).

It'll finish shortly and auto-notify me. Then I'll show the refined "tuned Adarsh" list, score WASB baseline / baseline+gate against it (Gemini as silver-GT), and PR the driver + provider hardening. "tail" anytime.

323. user (2026-06-06T16:43:20.323Z)

Let me give one more video path - "C:\Users\avidu\Projects\Annotation Setup\Collect\TestLargeVideo.MP4" for which I would want you to tell me after all the gemini tuning as to all the rally start and end points. Its a short clip so I will quickly eyeball and tell the improvement

324. assistant (2026-06-06T16:43:35.052Z)

On it ? I'll run the new clip through the same stack (WASB propose ? Gemini refine) and give you every rally start/end. The WASB inference is GPU-only (doesn't touch Gemini), so I can start it now without disturbing the Adarsh refine that's still finishing. First, probe the clip and check on the Adarsh run.

325. user (2026-06-06T16:43:39.619Z)

```
=== exists + probe ===
-rw-r--r-- 1 avidu 197609 1510427943 May  4 20:39 C:/Users/avidu/Projects/Annotation
Setup/Collect/TestLargeVideo.MP4
width=5312
height=2988
r_frame_rate=30000/1001
nb_frames=3019
duration=100.733967
size=1510427943
=== Adarsh gemini run status ===
processed: 30/45
```

326. assistant (2026-06-06T16:44:57.033Z)

Key detail from the probe: ****TestLargeVideo is 5312x2988 (5.3K), 29.97 fps, 3019 frames, 100 s, 1.5 GB.**** Two implications I need to handle:

- ****frame_width must be the real width**** for the velocity windowing. I'll extract WASB frames downsampled to 1920 (the detector resizes to 512x288 internally, so 1920 is lossless for detection but far faster/smaller), and use `frame_width=1920` consistently.
- ****Gemini clips from a 5.3K source would be big**** ? I'll downscale the uploaded clips (Gemini analyses at low res anyway), which also keeps them comfortably under your 500 MB rule.

Let me add clip downscaling to the shared chunk extractor + wire it into the refiner (a real win for high-res user videos), then start the GPU pass. (Adarsh refine is at 30/45, unaffected.)

327. user (2026-06-06T16:45:04.467Z)

```

334. assistant (2026-06-06T16:47:51.663Z)

Frames ready (3019). Re-staging the script and launching TestLargeVideo inference in the background, plus a peek at the Adarsh refine.

335. user (2026-06-06T16:47:59.762Z)

```
=== Adarsh gemini run ===
processed: 31/45
=== re-stage wasb_infer to WSL ===
staged
```

336. assistant (2026-06-06T16:48:08.630Z)

Adarsh refine at 31/45 (Gemini-side, cloud) ? won't contend with a local GPU pass. Launching TestLargeVideo WASB inference in the background:

337. user (2026-06-06T16:48:10.848Z)

Command running in background with ID: bs7z3ksi0. Output is being written to:
C:\Users\avidu\AppData\Local\Temp\claude\C--Users-avidu-Projects-badminton-highlight-indexer\42211f80-2169-4025-ad9d-99c1aa29ff70\tasks\bs7z3ksi0.output. You will be notified when it completes. To check interim output, use Read on that file path.

338. assistant (2026-06-06T16:48:25.020Z)

Both jobs are now cooking:

- `bkap9jri2` ? Adarsh Gemini refine (31/45, cloud)
- `bs7z3ksi0` ? TestLargeVideo WASB inference (~2 min, GPU)

Let me confirm my latest code edits (clip downscaling) didn't break anything while they run.

339. user (2026-06-06T16:48:38.867Z)

```
..... [100%]  
11 passed in 9.60s
```

340. assistant (2026-06-06T16:48:53.298Z)

11/11 green ? clip-downscaling wired cleanly.

Both jobs are running; I'll act on each as it completes:

- When ****TestLargeVideo WASB**** finishes (~2 min) ? copy trajectory ? Gemini-refine (29.97 fps, width 1920, clips downscaled to 1280) ? ****give you every rally start/end**** for your quick eyeball.
- When ****Adarsh refine**** finishes ? its refined list + the silver-GT comparison + the PR.

I'll report the TestLargeVideo rallies the moment they're ready. "tail" anytime if you want progress.

341. user (2026-06-06T16:50:27.399Z)

cand 4 1:32.893-1:40.634 -> 1:35.093-1:40.693
cand 3 1:06.433-1:30.657 -> 1:13.933-1:26.933
[gemini_refine] 5/5 candidates had a rally; 5 merged rallies, 49.0s play ->
output/testlarge_gemini_rallies.csv (181s)
```

346. assistant (2026-06-06T16:54:19.538Z)

Both finished ? and **TestLargeVideo's** rallies are ready **(your main ask)**. Let me read the exact start/end points (and grab the Adarsh result too).

347. user (2026-06-06T16:54:20.185Z)

```
1 rally_number,start_time,end_time,duration,start_mmss,end_mmss
2 1,8.800,11.500,2.700,0:08.800,0:11.500
3 2,24.389,46.589,22.200,0:24.389,0:46.589
4 3,49.183,54.683,5.500,0:49.183,0:54.683
5 4,73.933,86.933,13.000,1:13.933,1:26.933
6 5,95.093,100.693,5.600,1:35.093,1:40.693
7
```

348. assistant (2026-06-06T16:54:44.507Z)

Here are **all the rally start/end points for TestLargeVideo** (WASB ? Gemini-refined, the full tuned pipeline), ready for your eyeball:

#	Start	End	Duration
1	0:08.8	0:11.5	2.7 s
2	0:24.4	0:46.6	22.2 s
3	0:49.2	0:54.7	5.5 s
4	1:13.9	1:26.9	13.0 s
5	1:35.1	1:40.7	5.6 s

5 rallies, 49 s of play out of the 100.7 s clip. (`output/testlarge\_gemini\_rallies.csv`)

A couple of things to watch for as you scrub, because they show the refinement working:

- **Rally 1**: WASB proposed a loose 0:00?0:17 window; Gemini trimmed it to just 0:08.8?0:11.5, i.e. it cut ~14 s of warm-up/dead time WASB had swept in. If there's real play before 0:08.8, that'd be a recall miss ? worth a glance.
- **Rallies 2 & 4** are the long ones (22 s, 13 s) ? these are where WASB is strong and Gemini just confirms/tightens.
- One honest caveat: WASB proposed only **5 candidate windows** for this clip, so Gemini refined within those 5. If WASB missed a rally entirely (never proposed it), Gemini wouldn't see it ? so if your eyeball finds a 6th rally, that's a WASB-recall gap, not a Gemini error.

The Adarsh 45-candidate refine **also just finished** (exit 0). Tell me your TestLargeVideo eyeball verdict, and I'll then (a) show the full Adarsh refined list + score WASB-vs-Gemini as silver-GT, and (b) PR the `gemini\_refine` driver + provider hardening (retries, 500 MB guard, clip downscaling). Want both now, or after you've checked this clip?

349. user (2026-06-06T16:54:44.599Z)

You are free to spawn off more subagents but use gemini to improve the precision and I am here for eyeballing anytime you want!

350. assistant (2026-06-06T16:56:53.250Z)

Love it ? and let me be straight about where the precision lever actually is: Claude subagents can't watch the video better than Gemini, so spawning them to ***judge*** rallies adds nothing. The real precision gains come from **how I orchestrate Gemini**, and there are two concrete levers I haven't pulled yet:

1. ****Full-context pass**** ? the candidate-refine is capped by WASB's recall (TestLargeVideo only proposed 5 windows; rally 1 was a loose 17 s window Gemini had to trim to 2.7 s). Sending Gemini the **whole** clip (downscaled, under your 500 MB rule) lets it find rallies WASB never proposed and set boundaries with full context.
2. ****Ensemble voting**** ? judge each rally with N independent Gemini calls, keep the majority and use median boundaries ? rejects borderline false positives.

Let me build the full-context pass first (cheapest, biggest likely gain), run it on TestLargeVideo, and put it side-by-side with the candidate-refine so you can eyeball which is better.

207         ap.add_argument("--min-dur", type=float, default=2.0)
```

355. user (2026-06-06T16:57:42.861Z)

The file C:\Users\avidu\Projects\badminton-highlight-indexer\backend\eval\gemini_refine.py has been updated successfully. (file state is current in your context ? no need to Read it back)

356. user (2026-06-06T16:57:50.659Z)

The file C:\Users\avidu\Projects\badminton-highlight-indexer\backend\eval\gemini_refine.py has been updated successfully. (file state is current in your context ? no need to Read it back)

357. assistant (2026-06-06T16:58:03.106Z)

Built. Now the full-context pass on TestLargeVideo (whole clip, downscaled to 1280, one chunk) ? let me run it and put it head-to-head with the candidate-refine.

358. user (2026-06-06T17:00:12.661Z)

```
[gemini_full] 1 chunk(s) of C:/Users/avidu/Projects/Annotation Setup/Collect/TestLargeVideo.MP4
(<= 120.0s, width 1280) -> Gemini gemini-flash-latest
[gemini_full] 7 rallies, 34.5s play -> output/testlarge_gemini_fullvideo.csv
```

359. assistant (2026-06-06T17:00:19.444Z)

Full-context found **7 rallies (34.5 s)** vs candidate-refine's **5 rallies (49 s)** ? more rallies, tighter boundaries. Let me read it and lay them side-by-side.

360. user (2026-06-06T17:00:19.656Z)

	rally_number	start_time	end_time	duration	start_mmss	end_mmss
1	1	8.500	11.500	3.000	0:08.500	0:11.500
2	2	23.500	26.500	3.000	0:23.500	0:26.500
3	3	31.500	33.500	2.000	0:31.500	0:33.500
4	4	39.000	42.500	3.500	0:39.000	0:42.500
5	5	49.000	54.500	5.500	0:49.000	0:54.500
6	6	73.500	87.000	13.500	1:13.500	1:27.000
7	7	95.500	99.500	4.000	1:35.500	1:39.500

361. assistant (2026-06-06T17:00:56.275Z)

This is the precision win, and it exposes a real flaw in the candidate-refine. Side-by-side for TestLargeVideo:

```
| Candidate-refine (5) | Full-context (7) |
|---|---|
| 1: 0:08.8?0:11.5 | 1: 0:08.5?0:11.5 ? |
| **2: 0:24.4?0:46.6 (one 22 s blob)** | **2: 0:23.5?0:26.5** |
| | **3: 0:31.5?0:33.5** |
| | **4: 0:39.0?0:42.5** |
| 3: 0:49.2?0:54.7 | 5: 0:49.0?0:54.5 ? |
| 4: 1:13.9?1:26.9 | 6: 1:13.5?1:27.0 ? |
| 5: 1:35.1?1:40.7 | 7: 1:35.5?1:39.5 ? |
```

****The decisive difference is the 0:23?0:43 stretch.**** Candidate-refine reported it as ****one 22 s rally****; full-context says it's actually ****three separate rallies**** (0:23.5?0:26.5, 0:31.5?0:33.5, 0:39.0?0:42.5) with dead time between them.

Root cause: WASB's `merge\_gap=2.0` bridged the short between-point gaps into one 24 s candidate, and my ****envelope**** logic then collapsed it into a single 22 s "rally" ? sweeping ~13 s of dead time into a rally. That's exactly a precision loss. ****Full-context Gemini, seeing the whole clip, correctly splits it.**** Everything else the two agree on; full-context is a strict improvement (same rallies, tighter, plus the correct split).

****Here's where I need your eyes**** (the one check that settles it): scrub ****0:23 ? 0:43****. Is that ****one continuous rally**** (refine right) or ****three rallies with breaks**** (full-context right)? I'm confident it's three ? if you confirm, full-context becomes the precision-improved default and I'll drop the over-merging envelope.

Let me record the finding while you look.

362. user (2026-06-06T17:01:06.104Z)

The file C:\Users\avidu\claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md has been updated successfully. (file state is current in your context ? no need to Read it back)

363. assistant (2026-06-06T17:01:26.390Z)

Logged. I'll hold here for your ****0:23?0:43 verdict**** ? it's the one 20-second scrub that validates the whole full-context approach, so I don't want to build further on an unconfirmed premise.

Once you confirm (expecting "three rallies"):

1. ****Drop the over-merging envelope**** ? keep it only for single-segment candidates, so refine stops fusing multi-rally windows.
2. ****Make full-context the precision default****, and run it on ****Adarsh**** (~6 downscaled chunks) for its sharper rally list + the silver-GT comparison.
3. ****Ensemble voting**** (N Gemini judgments per rally, majority + median boundaries) if you want to squeeze precision further.
4. ****PR**** the whole Gemini stack (refine + full-context + provider hardening: retries, 500 MB guard, clip downscaling).

If your eyeball instead says "one rally," that's even more interesting ? it'd mean full-context is over-splitting, and I'd pivot to ensemble/boundary-merging. Either way your call decides it. Standing by ? and TestLargeVideo's current best answer is the 7-rally full-context list above.

364. user (2026-06-06T17:01:28.792Z)

Rally 2 is 24 - 26 only and then the next rally starts at 31 and end at 34. The next starts at 38/39 till 42. then the 49 rally comes correctly till 54. and then both the rallies are correctly classified.

365. assistant (2026-06-06T17:02:21.917Z)

That's the confirmation ? ****full-context is right****: 24?26, 31?34, 38/39?42, 49?54, plus the two later rallies, all matching. The 22 s "blob" was the envelope bug merging three real rallies. Your boundaries match Gemini's to within ~0.5 s (which the compiler padding absorbs).

So: full-context becomes the precision default, and I'll fix the over-merge properly ? drop the blunt envelope, and instead stitch only **tiny** gaps (<1 s, real shuttle-invisibility) while keeping genuine between-rally gaps separate. Let me apply that, then run Adarsh full-context.

366. user (2026-06-06T17:02:27.849Z)

The file C:\Users\avidu\Projects\badminton-highlight-indexer\backend\eval\gemini_refine.py has been updated successfully. (file state is current in your context ? no need to Read it back)

379. user (2026-06-06T17:04:55.524Z)

<https://github.com/avidullu/badminton-highlight-indexer/pull/29>
Switched to branch 'master'

380. assistant (2026-06-06T17:05:10.620Z)

PR #29 is up. (The working tree shows master's pre-Gemini files because the Gemini changes live on the PR #29 branch ? same independent-PR pattern as before.)

Let me update memory with your verdict and the PR, then I'll wait for the Adarsh full-context run.

381. user (2026-06-06T17:05:17.268Z)

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md has been updated successfully. (file state is current in your context ? no need to Read it back)

382. assistant (2026-06-06T17:05:31.274Z)

Done for this round ? your eyeball validated the approach and it's shipped:

****TestLargeVideo ? final precision-improved rallies**** (full-context, you confirmed):
`0:08.5?11.5 · 0:23.5?26.5 · 0:31.5?33.5 · 0:39?42.5 · 0:49?54.5 · 1:13.5?27 · 1:35.5?39.5` (7 rallies).

****Precision fix shipped ? [PR #29](https://github.com/avidullu/badminton-highlight-indexer/pull/29):****
- Dropped the over-merging envelope (the 22 s-blob bug); tiny invisibility splits healed by a ?1 s gap-merge, real gaps kept separate.
- Full-context (`--full-video`) is the precision default ? escapes WASB's recall ceiling.
- Provider hardened: upload + 503 retries, your ****500 MB upload guard****, clip downscaling for 4K/5K, default `gemini-flash-latest`, per-worker clients. 192 tests green.

****Running now**** (`b9fs6aylf`): Adarsh full-context ? `output/adarsh\_gemini\_fullvideo.csv`. When it lands I'll give you the Adarsh rally list the same way for eyeballing.

Open PRs to merge when you like: #27 (code map), #28 (gate A), #29 (Gemini precision). I'll surface Adarsh the moment it finishes ? "tail" anytime.

383. user (2026-06-06T17:05:31.581Z)

And yes I meant you being the orchestrator and using Gemini and WASB to improve the "local only" precision. if that makes sense?

384. assistant (2026-06-06T17:06:23.371Z)

Yes ? that makes complete sense, and it's the right framing. Let me say it back to be sure we're aligned:

****Gemini is the offline *teacher*; the *local-only* WASB + heuristics path is the *student* that ships.**** I (the orchestrator) use expensive cloud Gemini ***once, offline*** to produce silver-ground-truth rally labels, then ****calibrate the local-only knobs**** (velocity / merge-gap / min-duration **+++ gate-A net-crossings****) to match Gemini as closely as possible ? measured honestly across videos. Production then runs ****100% local**** (no Gemini, no upload, privacy lever intact, ~zero marginal cost); Gemini's quality is "distilled" into the thresholds. That's exactly the privacy/cost design you've been pointing at.

And the timing is perfect: with TestLargeVideo + Adarsh both getting Gemini labels, I finally have ****2 videos**** ? I can do honest ****leave-one-video-out**** (tune on one, test on the other) instead of single-video overfitting.

Let me check the Adarsh teacher-label run and then build the local-vs-Gemini calibrator.

385. user (2026-06-06T17:06:26.399Z)

=== Adarsh full-context status ===
[gemini_full] 7 chunk(s) of C:/Users/avidu/Projects/Annotation Setup/Collect/Adarsh and

```
Vasanth.MP4 (<= 120.0s, width 1280) -> Gemini gemini-flash-latest
=== result CSV? ===
ls: cannot access 'C:/Users/avidu/Projects/badminton-highlight-
indexer/output/adarsh_gemini_fullvideo.csv': No such file or directory
```

386. assistant (2026-06-06T17:06:44.622Z)

Adarsh teacher-labels still running (7 chunks). I'll build the **local-vs-Gemini calibrator** now so it's ready when the 2nd label set lands. Let me read ``calibration.py`` to reuse its ``leave_one_video_out`/`select_best`` correctly rather than duplicate.

387. user (2026-06-06T17:06:45.004Z)

```
1      """Quantify rally-segmentation improvement ? and guard against overfitting.
2
3      This is the measurement layer for per-video / per-corpus calibration. It answers
4      two questions honestly:
5
6      1. """Did precision improve, by how much?""" ? `improvement_report` scores a
7          baseline config vs a tuned config on the same ground truth and reports the
8          before/after metrics and the % delta.
9
10     2. """Is that gain real or overfit?""" ? calibration must be measured on data the
11         tuning never saw, otherwise you're just memorising. Two protocols:
12         - `cross_validate` ? k-fold over one video's rallies: pick the config on the
13           train folds, score on the held-out fold. The generalization_gap
14           (train ? test) is the overfit alarm.
15         - `leave_one_video_out` ? the protocol that matters as more videos arrive:
16           pick the config on all other videos, score on the held-out video. Reports
17           per-video held-out scores + mean±std. This is the number to trust.
18
19     Everything is segmenter-agnostic: callers pass a `predict_fn(config) ->
20     List[Interval]` (e.g. WASB trajectory ? windows at those thresholds), so the same
21     harness works for WASB, yolo_hybrid, or anything else. Pure + unit-tested; no I/O.
22     """

```

388. assistant (2026-06-06T17:07:26.811Z)

`leave\_one\_video\_out` takes `[name, predict\_fn, gts]` ? perfect. I'll build a local-only

`predict\_fn` = WASB windowing **+ gate A**, scored against Gemini silver-GT, with the 4-param grid (velocity/merge/min-dur/min-crossings) and honest LOVO across the two videos.

389. assistant (2026-06-06T17:07:49.091Z)

""Distill Gemini (teacher) into the LOCAL-ONLY pipeline (student) ? calibrate the on-device WASB+heuristic knobs to match Gemini's rally labels, so production runs 100% local (no cloud, privacy lever intact, ~zero marginal cost).

Pipeline being tuned (all local, no Gemini at runtime):

```
WASB trajectory CSV -> trajectory_to_action_windows(velocity, merge_gap, min_dur)
                    -> rally_gate (min_crossings)           -> rally windows
```

Ground truth = Gemini full-context silver labels (one CSV per video). With ≥ 2 videos we use leave-one-video-out (tune on the others, score the held-out one) ? the honest "how precise is the local pipeline on an unseen video" number. The output is a single local config + the precision it buys, with NO Gemini dependency shipped.

Reuses: TrackNetRunner windowing, rally_gate, calibrate_wasb.load_golden_gts, calibration.{select_best, leave_one_video_out, improvement_report}.

Run:

```
python -m backend.eval.calibrate_local --manifest videos.json
where videos.json = [{"name","trajectory","fps","frame_width","labels"}, ...]
(labels = a Gemini full-context CSV; trajectory = the WASB CSV).

395. assistant (2026-06-06T17:09:39.857Z)

Caught a dependency: `calibrate\_local` imports `rally\_gate`, which lives on the `gate-A` branch (PR #28), not yet on master. So this calibration genuinely builds on PR #28. Let me base it on that branch so it works, and run the test.

399. assistant (2026-06-06T17:10:36.831Z)

The local-only calibrator is built and tested (2/2). It's the `teacher?student distiller`: grid-searches the local knobs (velocity/merge/min-dur `gate-A crossings`, 180 configs) against Gemini's silver labels, with honest leave-one-video-out across the two clips. It depends on gate A (PR #28), so it's stacked on that branch.

Now it's just waiting on the `Adarsh teacher-labels` (`b9fs6aylf`, the 7-chunk full-context pass ? still processing; 120 s chunks take longer per call than the short candidate clips). The moment it lands I'll build the 2-video manifest and run the calibration ? you'll get `the tuned local-only config + its honest cross-video precision` (no Gemini at runtime).

Let me log the plan.

400. user (2026-06-06T17:10:36.886Z)

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md has been updated successfully. (file state is current in your context ? no need to Read it back)

401. assistant (2026-06-06T17:10:45.833Z)

Adarsh teacher-labels are in. Let me check the result, build the 2-video manifest, and run the local-only calibration.

402. user (2026-06-06T17:10:47.759Z)

```
=== Adarsh full-context result ===
[gemini_full] 7 chunk(s) of C:/Users/avidu/Projects/Annotation Setup/Collect/Adarsh and
Vasanth.MP4 (<= 120.0s, width 1280) -> Gemini gemini-flash-latest
[gemini_full] 36 rallies, 152.5s play -> output/adarsh_gemini_fullvideo.csv

best-fit (0.005, 2.0, 1.0, 0): P=0.400 R=0.286 F1=0.333 (F1 +0%, fit-on-self = optimistic)
```

```
[Adarsh] 36 Gemini rallies
baseline (0.02, 2.0, 2.0, 0): P=0.489 R=0.611 F1=0.543
best-fit (0.005, 1.0, 3.0, 3): P=0.731 R=0.528 F1=0.613 (F1 +13%, fit-on-self = optimistic)
```

```
--- HONEST leave-one-video-out (the number to trust) ---
```

baseline (untuned) mean held-out precision: 0.444
calibrated mean held-out precision: 0.320 ± 0.098 (gap +0.245)
held-out TestLargeVideo: 0.222 (cfg picked on others: (0.005, 1.0, 3.0, 3))
held-out Adarsh: 0.418 (cfg picked on others: (0.005, 2.0, 1.0, 0))

407. assistant (2026-06-06T17:13:40.487Z)

This is the honest, important result ? and it changes the recommendation. Two runs, F1-optimized and precision-optimized:

****The local pipeline, measured against Gemini for the first time (held-out / leave-one-video-out ? the trustworthy number):****

	baseline (untuned)	calibrated	overfit gap
***F1-optimized**	0.438	0.483 ± 0.17	+0.035 ? small
***Precision-optimized**	0.444	0.320 ± 0.10	+0.245 ?? huge

Read carefully, because it's not the rosy answer:

- ****F1-tuning gives a small, honest lift**** (0.44 ? 0.48, low overfit gap). Real but modest.
- ****Precision-tuning overfits badly**** ? held-out precision actually ****drops**** (0.44 ? 0.32) with a +0.245 gap. Chasing precision on the threshold grid memorizes each video's quirks and ****doesn't transfer****. The two videos even want opposite configs (Adarsh likes aggressive gating ``min_crossings=3``; TestLargeVideo likes none).
- ****Why:**** only ****2 videos, and very dissimilar**** (5.3K phone clip vs the Adarsh setup), so leave-one-video-out is noisy and transfer is weak. TestLargeVideo is also ****recall-capped**** ? WASB proposed ~5 windows but Gemini found 7, so the local pipeline can't exceed ~5/7 there no matter the thresholds.

****Honest conclusion:**** the local-only pipeline agrees with Gemini at only ~0.44 precision/F1, and ****threshold-tuning alone hits a ceiling fast**** (and overfits for precision on so few videos). The real levers for local precision are:

1. ****More teacher-labeled videos**** (next week) ? stable LOVO, configs that actually transfer.
2. ****A learned distilled model**** ? train the existing ``classifier.py`` on Gemini labels using candidate features (peak/mean velocity, active frames, ****net-crossings****) instead of 4 hand thresholds. This can capture patterns thresholds can't, and is the proper "distill Gemini into local."
3. ****Better WASB recall**** (raise the candidate ceiling).

The calibration ***framework*** is the valuable deliverable here (it's the teacher-student measurement harness, and it'll only get better as videos arrive). Let me record this and commit it, then I'd recommend the ****learned-distillation**** path over more threshold-tuning.

408. user (2026-06-06T17:13:49.502Z)

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md has been updated successfully. (file state is current in your context ? no need to Read it back)

409. assistant (2026-06-06T17:14:02.714Z)

Let me run the suite on this branch and ship the calibration framework as a PR.

410. user (2026-06-06T17:14:18.238Z)

Switched to branch 'master'

413. assistant (2026-06-06T17:15:09.830Z)

PR #30 is up (stacked on #28). Here's where we've landed ? and a genuine fork on what's next.

What this Gemini-as-teacher work produced

- ****Two videos given full-context Gemini labels**** (TestLargeVideo: 7 rallies, validated by your eyeball; Adarsh: 36).
- ****The local-only pipeline measured against Gemini for the first time**** ? honest leave-one-video-out precision/F1 ? ****0.44****.
- ****Calibration framework shipped**** ([PR #30](<https://github.com/avidullu/badminton-highlight-indexer/pull/30>)) ? the reusable teacher?student harness.

The honest signal (this is the important part)

Threshold-tuning the local knobs ****hits a low ceiling and overfits for precision**** with only 2 dissimilar videos (held-out precision actually **dropped**). So pouring more effort into threshold search won't move local precision much. The data points clearly at two real levers instead: ****a learned distilled model**** (train `classifier.py` on Gemini labels with the candidate features) and ****more teacher-labeled videos**** (which you have coming next week and which the framework now ingests via a manifest).

Open PR stack to merge when ready: ****#27**** code-map, ****#28**** gate-A, ****#29**** Gemini-refine, ****#30**** local-calibration (stacked on #28).

Given the 2-video overfit, the genuinely data-driven move is to lean on next week's videos ? but prototyping the learned model now would de-risk it. Your call:

414. user (2026-06-06T17:15:53.290Z)

Your questions have been answered: "How do you want to push local-only precision from here, given the 2-video threshold ceiling?"="Wait for next week's videos". You can now continue with these answers in mind.

415. assistant (2026-06-06T17:16:27.764Z)

Understood ? pausing precision work until the new videos land. That's the data-honest call (2 dissimilar videos overfit; the learned model and stable LOVO both need more teacher data). Let me set up a clean resumption so next week is a 10-minute job, not a re-derivation.

416. user (2026-06-06T17:16:44.149Z)

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md has been updated successfully. (file state is current in your context ? no need to Read it back)

417. assistant (2026-06-06T17:17:03.713Z)

Saved a full ****next-week runbook**** to memory so resumption is mechanical (merge the PR stack ? per new video: probe?frames?WASB?Gemini labels?manifest ? re-run `calibrate\_local` + build the learned model). Nothing to re-derive.

Session wrap

****Merged earlier:**** #25 (WASB checkpointing), #26 (export tuned segments).

```
**Open PR stack** (yours to review/merge ? order matters: #28 before #30):  
- **#27** ? `docs/CODE_MAP.md` cold-start map  
- **#28** ? gate-A (shuttle net-crossing rally filter)  
- **#29** ? Gemini precision pass (refine + full-context, provider hardening, 500 MB guard, clip downscaling)  
- **#30** ? `calibrate_local` teacher?student distiller (stacked on #28)
```

****The headline finding**** (honest): with Gemini as an offline teacher, the local-only pipeline's true precision vs Gemini is ~0.44, and ****threshold-tuning ceilings out / overfits on just 2 dissimilar videos****. The real local-precision levers are a ****learned distilled model**** + ****more teacher videos**** ? both queued for next week, framework ready.

****Validated deliverables you eyeballed:**** TestLargeVideo's 7-rally list (full-context, you confirmed the 0:23?0:43 three-way split), and the gate-A junk removal on Adarsh.

****Housekeeping:**** there's ~12?14 GB of deletable extracted frames in `%TEMP%` (`adarsh\_frames` 7.9 GB, `testlarge\_frames`, `sample\_long\_frames` 4.1 GB) ? all regenerable from the cached trajectories. Want me to delete them to reclaim the space, or leave them so next week's re-runs skip extraction? (The small trajectory CSVs + Gemini labels stay either way.)

Great session ? the teacher/student architecture is the right backbone for keeping inference local while borrowing Gemini's quality offline. ?

418. user (2026-06-06T17:17:06.137Z)

and feel free to use me for eval and grounding rallies in either video. I can give you one more video, but lets fully absorb these first
The video is "C:\Users\avidu\Projects\Annotation Setup\Collect\VeryLargeTestVideo.MP4" and once you have used Gemini for tuning, we will run the final on this new video and I will do manual evals
The PRs are merged and I **want** the distilled model approach!

419. assistant (2026-06-06T17:17:36.964Z)

PRs merged, distilled model it is ? and I'll hold VeryLargeTestVideo as the clean held-out test for your manual eval until the distillation is fully absorbed on the two current videos. Let me sync master and read the existing learning pieces (`training.py`, `classifier.py`) to reuse them rather than reinvent.

420. user (2026-06-06T17:17:41.104Z)

```

```

421. assistant (2026-06-06T17:18:21.636Z)

master has rally_gate + gemini_refine (#28, #29). ****PR #30 (`calibrate\_local`) didn't reach master**** ? it was stacked on the gate branch, so merging #28 didn't carry it. I'll retarget it to master so it's mergeable. Good news: the ****distilled model doesn't need `calibrate\_local`**** ? it only needs `classifier.py`, `rally\_gate`, `metrics`, the windowing, and `load\_golden\_gts`, all on master now. Let me retarget #30 and read the learning pieces.

422. user (2026-06-06T17:18:26.549Z)

```
=== PR #30 state ===  
{ "baseRefName": "feat/rally-start-gate", "headRefName": "feat/local-calibration", "state": "MERGED" }
```

```
=== retarget #30 to master (clean diff now #28 is merged) ===
GraphQL: Cannot change the base branch of a closed pull request. (updatePullRequest)
=== open PRs now ===
```

423. assistant (2026-06-06T17:18:49.451Z)

PR #30 merged into the **gate** branch, not **master** ? so `calibrate_local.py` is stranded (same stacked-merge trap that hit the `calibrate_wasb` file earlier). The distill work doesn't depend on it, but I'll recover it onto master as part of this work. Let me set up the branch, restore the stranded file, and read `training.py` + `classifier.py`.

424. user (2026-06-06T17:18:52.783Z)

```
=== calibrate_local on gate branch? ===
yes, present on origin/feat/rally-start-gate
Switched to a new branch 'feat/distill-local'
=== restore stranded calibrate_local + test onto this branch ===

backend/eval/calibrate_local.py
tests/test_calibrate_local.py
```

425. user (2026-06-06T17:18:59.235Z)

```
1      """Build a training set for the offline, API-free learned rally segmenter.
2
3      Phase 4 of the collector->indexer bridge (see docs/ROADMAP.md, ADR-004). The idea:
4      a detector (YOLO player-motion today, optionally WASB shuttle-motion later)
5      produces candidate rally windows with features; the collector's ground-truth
6      rally intervals tell us which windows are real. A lightweight classifier learns
7      that mapping, replacing the paid Gemini refinement with a local model.
8
9      This module is the data layer ? pure and unit-tested:
10
11      - `label_candidates` ? generic: label windows positive/negative by whether they
12        match a ground-truth rally (same IoU matching the evaluator uses, so training
13        labels are consistent with how we score).
14      - `extract_yolo_features` ? YOLO-specific feature vector from a candidate row's
15        persisted `stats`. Pluggable: a WASB substrate supplies its own feature_fn.
16      - `build_training_set` ? glue: rows + GT -> (X, y, intervals).
17
18      No model training or I/O here; that lives in the trainer/segmenter once the
19      substrate is chosen from the Phase 3 candidate-recall result.
20      """
21
22      from typing import Callable, Dict, List, Tuple
23
24      from backend.eval.metrics import Interval, match_intervals
25
26      # YOLO Stage-1 persists these per candidate window in `candidate_segments.stats`
27      # (see HybridYoloSegmenter). Duration is derived from the window bounds.
28      YOLO_FEATURE_NAMES = [
29          "duration", "peak_velocity", "mean_velocity", "active_frame_count",

82

```

426. assistant (2026-06-06T17:18:58.430Z)

Recovered. Now let me read the learning pieces to reuse them for the distilled model.

427. user (2026-06-06T17:18:59.075Z)

```

1     """A tiny, dependency-free logistic-regression classifier (numpy only).
2
3     The offline learned segmenter (ADR-004) must run locally with no external API and
4     no heavy ML stack ? the project already depends on numpy, and sklearn is not
5     installed. This implements just enough: standardized features, balanced-class
6     gradient descent, sigmoid probabilities, and JSON (de)serialization so a trained
7     model is a small, human-readable, version-controllable file.
8
9     It deliberately stays simple: the rally-window features are few and roughly
10    linearly separable (high player motion + sustained activity => real rally), so a
11    well-regularized linear model is a sensible, inspectable baseline. Swap in a
12    richer model later behind the same fit/predict_proba/save/load interface.
13    """

428. assistant (2026-06-06T17:20:29.201Z)

Now I have all the pieces: `classifier.LogisticRegression`, `training.label\_candidates` (IoU-labels candidates against GT ? exactly what I need to label WASB candidates by Gemini), and `rally\_gate.gate\_windows` (gives net-crossings per window). Let me write the distilled-model driver ? it learns "which WASB candidate is a real rally" from Gemini labels using ****resolution/fps-invariant**** features, with honest LOVO and a learned-vs-threshold-baseline comparison.

429. assistant (2026-06-06T17:20:59.907Z)

""""Distill Gemini (teacher) into a LEARNED local rally classifier (student).

Threshold-tuning the local knobs hit a low ceiling (see `calibrate_local`). This goes further: learn "is this WASB candidate a real rally?" from Gemini silver labels, using a few resolution/fps-INVARIANT local features, so the model transfers across videos and runs 100% local at inference (no Gemini, privacy lever intact).

Flow (all local at runtime):

```

WASB trajectory -> recall-oriented candidate windows (propose many; classifier
filters) -> per-candidate features [duration, peak_velocity, mean_velocity,
active_ratio, net_crossings] -> LogisticRegression(prob >= threshold) -> merge
-> rally windows.

```

Training labels come from Gemini full-context labels via the SAME IoU matching the evaluator uses (`training.label_candidates`). Honest leave-one-video-out: train on the other videos' candidates, predict the held-out one, score vs its Gemini labels, and compare against the threshold baseline. Reuses `classifier.py`, `training.label_candidates`, `rally_gate`, `metrics`, `calibrate_wasb.load_golden_gts`, `gemini_refine.merge_overlaps`.

Run:

```
python -m backend.eval.distill_local --manifest videos.json --model-out
output/local_rally_model.json
"""
from __future__ import annotations

435. assistant (2026-06-06T17:22:50.754Z)

Honest result ? and it's important, so I'll give it to you straight rather than dress it up.

****The distilled model is built and evaluated**** (LogisticRegression on 5 resolution/fps-invariant features, trained on Gemini labels, honest leave-one-video-out). But on ****2 videos it currently *underperforms* the dumb threshold baseline:****

	held-out	LEARNED F1	baseline F1
TestLargeVideo	0.308	0.333	
Adarsh	0.410	0.543	
mean	**0.359**	**0.438**	

Two root causes, both data/recall ? ****not**** the method:

1. ****n = 2 is too few.**** With one training video, the classifier learns that video's feature distribution and it doesn't transfer to a different camera/resolution/style. Standardizing on a single video is unreliable.
2. ****WASB proposal-recall ceiling.**** Even my deliberately-permissive proposal only overlaps ****3 of 7**** Gemini rallies on TestLargeVideo (ceiling ****0.43****) ? WASB's windows just don't align with the rallies there. No classifier can exceed that. (Adarsh ceiling is 0.81, much healthier.)

So: the distilled-model ***machinery*** you wanted is done and ready, but it's ****starving for data**** ? exactly the gap next week's videos fill. Right now the honest "best local config" is still the baseline windowing. Let me commit this (the framework is the durable asset), then talk about VeryLargeTestVideo.

```

439. assistant (2026-06-06T17:24:33.813Z)

PR #31 up (distilled model + recovered `calibrate\_local`; 202 tests green).

****VeryLargeTestVideo is 4K**** (3840×2160), 59.94 fps, ****46,080 frames, 12m49s, 11.5 GB**** ? your biggest yet. Since you said we'd run the final on it for manual eval, I'll start the long pole now (it's local-only, no Gemini needed ? ****your manual eval IS the ground truth****). I'll produce ****both**** the baseline windowing and the learned-model rally lists so your eyeball directly settles which wins on a fresh 4K clip.

Starting frame extraction (downscaled 1920, lossless for the detector) in the background:

440. user (2026-06-06T17:24:36.133Z)

Command running in background with ID: bzt8hc4ks. Output is being written to:
C:\Users\avidu\AppData\Local\Temp\claude\C--Users-avidu-Projects-badminton-highlight-indexer\42211f80-2169-4025-ad9d-99c1aa29ff70\tasks\bzt8hc4ks.output. You will be notified when it completes. To check interim output, use Read on that file path.

441. assistant (2026-06-06T17:24:50.087Z)

While that runs (~15?20 min for 46K 4K frames), let me record the state.

442. user (2026-06-06T17:24:55.276Z)

The file C:\Users\avidu\claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md has been updated successfully. (file state is current in your context ? no need to Read it back)

443. assistant (2026-06-06T17:25:07.752Z)

Recorded. Here's the plan in flight for VeryLargeTestVideo (your held-out final test):

1. ****Extract frames**** ? running now (`bzt8hc4ks`, ~15?20 min for 46K 4K frames, downscaled to

1920).

2. ****WASB inference**** ? I'll launch when frames are ready (~25 min, checkpointed).

3. ****Produce two rally lists**** ? baseline windowing ****and**** the distilled learned model ? on the same trajectory.

4. ****Hand both to you for manual eval.**** Your verdict is the ground truth here (no Gemini needed on this clip), and it doubles as a ****3rd-video human GT**** ? which is exactly the data the distilled model is starving for. So even though the learned model trails baseline on 2 videos today, this run actively feeds the fix.

Net honest picture you're working with: the distilled approach you want is ****built and ready****, but on 2 videos it's data-starved (learned F1 0.359 < baseline 0.438); the real unlock is more labeled videos (next week + this one's manual eval) and better WASB recall. PR #31 has the model + the recovered `calibrate\_local`.

It's a ~40-min local pass ? I'll surface the two rally lists for your eyeball the moment they're ready, and "tail" works anytime for progress. Go enjoy a break. ?

444. user (2026-06-06T17:25:09.485Z)

Based on the findings we have had and the goals, can you spawn off a mini research to see if there are some other interesting ways we can explore to find rallies or the teacher student is the best we have.

445. assistant (2026-06-06T17:26:39.323Z)

Great question to ask before over-committing to one path. This is exactly what the deep-research harness is for ? I'll spawn a focused, fact-checked survey of rally-detection methods, grounded in **our** constraints (local-first, permissive licensing, WASB trajectory + optional pose/audio), with an explicit verdict on whether teacher-student is the best or just one option. The VeryLargeTestVideo extraction keeps running in the background meanwhile.

446. user (2026-06-06T17:26:50.646Z)

Launching skill: deep-research

447. user (2026-06-06T17:26:50.638Z)

Run the "deep-research" workflow.

Deep research harness ? fan-out web searches, fetch sources, adversarially verify claims, synthesize a cited report.

When the user wants a deep, multi-source, fact-checked research report on any topic. BEFORE invoking, check if the question is specific enough to research directly ? if underspecified (e.g., "what car to buy" without budget/use-case/region), ask 2-3 clarifying questions to narrow scope. Then pass the refined question as args, weaving the answers in.

Phases:

- Scope: Decompose question (from args) into 5 search angles
- Search: 5 parallel WebSearch agents, one per angle
- Fetch: URL-dedup, fetch top 15 sources, extract falsifiable claims
- Verify: 3-vote adversarial verification per claim (need 2/3 refutes to kill)
- Synthesize: Merge semantic dupes, rank by confidence, cite sources

Invoke: Workflow({ name: "deep-research", args: "Research alternative methods to automatically detect rally start/end segments (temporal segmentation) in racket-sport video ? especially badminton ? for a SELF-HOSTED, LOCAL-FIRST pipeline, and assess whether a cloud-VLM teacher ? local-model distillation is the best approach or whether other methods are competitive or complementary. Keep it focused (\"mini\" research): prioritize actionable, commercially-licensable, locally-runnable approaches over exotic SOTA needing huge compute or restrictive licenses.\n\nOUR CONTEXT / CONSTRAINTS (ground every recommendation in these):\n- Self-hosted on a single consumer GPU (RTX 2070 Super), Windows + WSL2. We want LOCAL-ONLY inference at runtime ? privacy lever: user video never leaves the device. It's a commercial product, so PERMISSIVE / commercial-friendly licenses are REQUIRED (avoid AGPL and non-commercial-only

weights/datasets).\n- Current substrate: WASB (MIT) shuttle-trajectory detector ? per-frame (x, y, visibility). We derive rally windows via velocity/merge-gap/min-duration thresholds plus a net-crossing gate. We ALSO have a permissive person detector available (torchvision Faster R-CNN + supervision ByteTrack) and the video's AUDIO track.\n- Current best approach: use paid Gemini (cloud VLM, full-context) OFFLINE as a TEACHER to label rallies, then DISTILL into a local model (logistic regression on shuttle-trajectory features). Findings so far: threshold-tuning ceilings around F1 ? 0.44 and overfits with few videos; the learned model is data-starved at n=2 labeled videos; WASB candidate RECALL is a real bottleneck (its windows sometimes don't align with true rallies at IoU 0.5).\n- Inputs we can exploit locally: video frames, the shuttle trajectory, player bounding boxes / pose (if we add a permissive pose model), and the AUDIO track (shuttle \"thwack\" hits, crowd noise, umpire/score calls).\n\nSPECIFICALLY COVER:\n1. Method families for rally/point segmentation in racket sports (badminton, tennis, table tennis, pickleball): audio-based shot/hit detection; temporal action localization (TAL) deep models; pose/player-stance + court-homography state machines (e.g., \"serve-ready stance\" gating); classical change-point detection / HMM on the shuttle trajectory; scoreboard / score-overlay OCR for point boundaries; self-supervised / weakly-supervised approaches; and VLM teacher?student distillation.\n2. For EACH family: how it works, the labels/data it needs, expected accuracy, local-inference COMPUTE cost, and LICENSE / commercial viability of any models, datasets, or weights involved.\n3. Badminton rally-segmentation datasets (e.g., ShuttleSet, TrackNet/TrackNetV2 data) and their licenses / commercial usability.\n4. A RANKED recommendation for our local-first, permissive, single-GPU setup: is Gemini-teacher ? local-distillation the best, or are some alternatives competitive or complementary ? especially AUDIO-based hit detection and pose/court-geometry state machines, which we can run fully locally?\n5. Concrete, cheap next experiments we could run with what we already have (shuttle trajectory + person detector).\" })

448. assistant (2026-06-06T17:27:41.350Z)

Launching the research workflow now (it runs in the background and I'll post it when it lands), and since you're calling a pause, let me check on the in-flight VeryLargeTestVideo job and verify your collector-rating assumption rather than just agreeing.

449. user (2026-06-06T17:27:51.936Z)

Workflow launched in background. Task ID: wxzp6h7xk
Summary: Deep research harness ? fan-out web searches, fetch sources, adversarially verify claims, synthesize a cited report.

455. assistant (2026-06-06T17:29:13.217Z)

Confirmed ? ****your assumption is right.**** `import-local` is exactly that mode: it registers a local video + a rally annotation file, ****validates the rallies****, and stores them as CURATED (golden) data. Let me stop the now-paused 4K extraction and grab the exact annotation schema so I can give you the precise command.

456. user (2026-06-06T17:29:13.698Z)

458. assistant (2026-06-06T17:29:43.075Z)

Verified the schema. ****You're exactly right**** ? and this is a better path than relying on Gemini's silver labels. Here's the precise flow.

****You as a rater ? golden data ? feeds the model:****

1. Make a CSV with the columns `rally\_number,start\_time,end\_time` (start/end in seconds; it also accepts JSON, lowercases headers, and takes optional `shots\_count`/`ending\_reason`):

```
'''
rally_number,start_time,end_time
1,8.8,11.5
2,24.4,46.6
'''
```

2. Register it as curated golden data (it ****validates**** the rallies first):

```
'''
python -m src.cli.curate import-local --sport badminton \
--video-path "<video>" --annotations-path "<your_rallies.csv>" --license Proprietary
'''
```

3. `python -m src.cli.curate export` emits it in the indexer's eval format ? drop it into the calibration manifest ? `calibrate\_local` / `distill\_local` pick it up.

Why this matters: your hand-rated timestamps are ****human golden labels****, which are ***better*** than the Gemini silver labels the distillation has been training on. So your becoming a rater directly attacks the two things that capped the model ? ****too few labeled videos**** and ****label quality****. Each video you rate is one more (high-quality) training+eval point.

****Pause honored:****

- ****Stopped**** the VeryLargeTestVideo 4K extraction (was 12,246/46,080; partial frames in `%TEMP%\verylarge\_frames` are deletable ? say the word and I'll clean them, or I'll leave them if you'll rate that clip and want the frames cached).
- ****Research workflow is still running**** (`wxzp6h7xk`) per your "post the research" ? I'll post the cited report when it lands, then we're fully paused.

Let me log the self-rating path into the resumption plan.

459. user (2026-06-06T17:29:50.657Z)

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md has been updated successfully. (file state is current in your context ? no need to Read it back)

460. assistant (2026-06-06T17:30:03.934Z)

All set and logged. Net state: ****modeling paused****; you have a clean, confirmed path to generate the golden data that actually unblocks it (self-rate ? `import-local` ? `export` ? calibration manifest), which gives human labels that beat the Gemini silver the model's been starving on.

The only thing still in flight is the ****research report**** (`wxzp6h7xk`) ? I'll post the cited findings the moment it completes, and then we're fully parked until you've got golden labels. Nothing else running.

Open PR to merge when convenient: ****#31**** (distilled model + recovered `calibrate\_local`). Enjoy the break ? I'll surface the research when it's ready. ?

461. user (2026-06-06T17:30:05.329Z)

I wish we had a tool which played an input video and everytime a user paused, it would ask whether the rally has started or ended and enter the point stop reason (unforced/forced/serve fault etc.) .. then one could start that tool and annotate a video while the tool keeps track of time and omits a format which the collector can ingest. Can you spawn off a agent tasks to see the feasibility of building it and maybe build such a player on top of VLC as a plugin?

462. assistant (2026-06-06T17:31:56.251Z)

This is the ***right*** tool to build ? it turns you into an efficient rater, which is exactly the golden-data unlock we just identified. Let me spawn a focused workflow: feasibility (VLC Lua plugin API + your existing VLC setup + the exact collector CSV schema) ? build a v1 plugin ? adversarially verify it against the real VLC API and the collector parser. I can't click through VLC myself, so I'll be upfront that v1 needs your test run, but it'll be grounded and

installable.

463. user (2026-06-06T17:32:34.132Z)

Workflow launched in background. Task ID: w6nwcw33

Summary: Feasibility + build a VLC Lua plugin that marks rally start/end + stop-reason while watching, emitting a collector-ingestable CSV

Transcript dir: C:\Users\avidu\claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\42211f80-2169-4025-ad9d-99c1aa29ff70\subagents\workflows\wf_c03ffa6c-cb8

Script file: C:\Users\avidu\claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\42211f80-2169-4025-ad9d-99c1aa29ff70\workflows\scripts\vlc-rally-annotator-wf_c03ffa6c-cb8.js

(Edit this file with Write/Edit and re-invoke Workflow with {scriptPath:

"C:\Users\avidu\claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\42211f80-2169-4025-ad9d-99c1aa29ff70\workflows\scripts\vlc-rally-annotator-wf_c03ffa6c-cb8.js"} to iterate without resending the script.)

Run ID: wf_c03ffa6c-cb8

To resume after editing the script: Workflow({scriptPath: "C:\Users\avidu\claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\42211f80-2169-4025-ad9d-99c1aa29ff70\workflows\scripts\vlc-rally-annotator-wf_c03ffa6c-cb8.js", resumeFromRunId: "wf_c03ffa6c-cb8"}) ? completed agents return cached results.

You will be notified when it completes. Use /workflows to watch live progress.

464. assistant (2026-06-06T17:32:51.064Z)

Both workflows are now running in the background:

- **wxzp6h7Xk** ? rally-detection methods research ? I'll post the cited report.
- **w6nwcw33** ? VLC rally-annotator feasibility + build ? I'll write the verified `.lua` plugin + install/usage README (and the exact `import-local` command to ingest its CSV), with an honest confidence note since you'll need to load it in VLC to confirm.

The annotator closes the loop beautifully: **VLC plugin ? rally CSV ? `import-local` ? `export` ? calibration/distillation manifest.** It makes you a fast rater, which is the golden-data source that actually moves the model.

I'll surface each the moment it lands ? research report first or plugin first, whichever finishes ? then we're parked on the modeling until you've got labels. "tail" anytime for progress on either. ?

465. user (2026-06-06T17:32:52.852Z)

I will rate the clips and hence please leave them as cached merged #31

466. assistant (2026-06-06T17:33:30.609Z)

Got it on both:

1. **Leave everything cached** ? I won't delete any frames or trajectories. The Adarsh + TestLargeVideo WASB trajectories stay ready so that the moment you `import-local` your golden labels, `calibrate\_local`/`distill\_local` can use them with zero re-extraction.
2. **#31 merged** ? let me sync master and confirm `distill\_local` + `calibrate\_local` landed, then tidy merged branches.

467. user (2026-06-06T17:33:35.089Z)

Switched to branch 'master'

```
create mode 100644 backend/eval/calibrate_local.py
create mode 100644 backend/eval/distill_local.py
create mode 100644 tests/test_calibrate_local.py
create mode 100644 tests/test_distill_local.py
=== distill_local + calibrate_local on master now? ===
backend/eval/calibrate_local.py
```

```
backend/eval/distill_local.py
=== merged local branches (safe to delete) ===
```

468. assistant (2026-06-06T17:33:49.159Z)

`distill\_local` + `calibrate\_local` are on master ? all five PRs (#27?#31) fully landed. Let me see the local branches and prune the merged ones (content's confirmed on master).

469. user (2026-06-06T17:33:52.296Z)

```
=== all local branches ===
docs/code-map
feat/distill-local
feat/gemini-refine
feat/local-calibration
feat/rally-start-gate
* master
=== prune remote-tracking refs for deleted remotes ===
=== master tip ===
0c6f2c1 feat(eval): distilled local rally classifier + recover calibrate_local (#31)
88a693b feat(eval): Gemini precision pass for WASB rallies (refine + full-context) (#29)
6eaf85d feat(detectors): rally-start gate ? suppress between-point false fires (gate A) (#28)
```

470. assistant (2026-06-06T17:34:13.490Z)

All five PRs landed (squash-merged). The local feature branches' content is confirmed on master ? safe to prune both local and remote (keeping the intentionally-retained khelacharya branch).

471. user (2026-06-06T17:34:20.001Z)

```

472. assistant (2026-06-06T17:34:38.932Z)

Clean. master has all five PRs (#27?#31); this session's branches pruned local + remote. Three *pre-existing* merged stragglers remain (`docs/ending-reason-forced-unforced` #19, `feat/rally-slicer` #20, `feat/wasb-substrate` #21) ? I left those alone per the earlier caution note; say the word and I'll prune them too. `feat/khelacharya-shot-intelligence` retained as you decided.

Let me record the merge + the leave-cached decision.

473. user (2026-06-06T17:34:50.051Z)

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md has been updated successfully. (file state is current in your context ? no need to Read it back)

474. assistant (2026-06-06T17:35:00.351Z)

All tidy:

- **master = all five PRs merged**, working tree clean, this session's branches pruned.
- **Clips left cached** as you asked ? Adarsh + TestLargeVideo trajectories are ready, so when you `import-local` your rated labels they feed `calibrate\_local`/`distill\_local` with zero re-extraction.

Two things still cooking in the background, both of which I'll surface when ready:

- **wxzp6h7xk** ? rally-detection methods research ? cited report.
- **w6nwcw33** ? VLC rally-annotator plugin ? I'll drop the verified `.lua` + install/usage README so you can start rating clips in VLC.

Then we're fully parked until your golden labels are in. Talk soon. ?

475. user (2026-06-06T17:43:42.716Z)

<status>completed</status>
<summary>Dynamic workflow "Deep research harness ? fan-out web searches, fetch sources, adversarially verify claims, synthesize a cited report." completed</summary>
<result>{"question":"Research alternative methods to automatically detect rally start/end segments (temporal segmentation) in racket-sport video ? especially badminton ? for a SELF-HOSTED, LOCAL-FIRST pipeline, and assess whether a cloud-VLM teacher ? local-model distillation is the best approach or whether other methods are competitive or complementary. Keep it focused (\\"mini\\" research): prioritize actionable, commercially-licensable, locally-runnable approaches over exotic SOTA needing huge compute or restrictive licenses.\n\nOUR CONTEXT / CONSTRAINTS (ground every recommendation in these):\n- Self-hosted on a single consumer GPU (RTX 2070 Super), Windows + WSL2. We want LOCAL-ONLY inference at runtime ? privacy lever: user video never leaves the device. It's a commercial product, so PERMISSIVE / commercial-friendly licenses are REQUIRED (avoid AGPL and non-commercial-only weights/datasets).\n- Current substrate: WASB (MIT) shuttle-trajectory detector ? per-frame (x, y, visibility). We derive rally windows via velocity/merge-gap/min-duration thresholds plus a net-crossing gate. We ALSO have a permissive person detector available (torchvision Faster R-CNN + supervision ByteTrack) and the video's AUDIO track.\n- Current best approach: use paid Gemini (cloud VLM, full-context) OFFLINE as a TEACHER to label rallies, then DISTILL into a local model (logistic regression on shuttle-trajectory features). Findings so far: threshold-tuning ceilings around F1 ? 0.44 and overfits with few videos; the learned model is data-starved at n=2 labeled videos; WASB candidate RECALL is a real bottleneck (its windows sometimes don't align with true rallies at IoU 0.5).\n- Inputs we can exploit locally: video frames, the shuttle trajectory, player bounding boxes / pose (if we add a permissive pose model), and the AUDIO track (shuttle \\"thwack\\" hits, crowd noise, umpire/score calls).\n\nSPECIFICALLY COVER:\n1. Method families for rally/point segmentation in racket sports (badminton, tennis, table tennis, pickleball): audio-based shot/hit detection; temporal action localization (TAL) deep models; pose/player-stance + court-homography state machines (e.g., \\"serve-ready stance\\" gating); classical change-point detection / HMM on the shuttle trajectory; scoreboard / score-overlay OCR for point boundaries; self-supervised / weakly-supervised approaches; and VLM teacher?student distillation.\n2. For EACH family: how it works, the labels/data it needs, expected accuracy, local-inference COMPUTE cost, and LICENSE / commercial viability of any models, datasets, or weights involved.\n3. Badminton rally-segmentation datasets (e.g., ShuttleSet, TrackNet/TrackNetV2 data) and their licenses / commercial usability.\n4. A RANKED recommendation for our local-first, permissive, single-GPU setup: is Gemini-teacher ? local-distillation the best, or are some alternatives competitive or complementary ? especially AUDIO-based hit detection and pose/court-geometry state machines, which we can run fully locally?\n5. Concrete, cheap next experiments we could run with what we already have (shuttle trajectory + person detector + audio).", "summary":"For a local-first, single-GPU, commercially-licensed badminton rally-segmentation pipeline, the evidence does NOT crown the Gemini-teacher ? local-distillation approach as uniquely best; instead it points to a

{
  "question": "Research alternative methods to automatically detect rally start/end segments
(temporal segmentation) in racket-sport video \u2014 especially badminton \u2014 for a SELF-
HOSTED, LOCAL-FIRST pipeline, and assess whether a cloud-VLM teacher \u2192 local-model
distillation is the best approach or whether other methods are competitive or complementary.
Keep it focused (\u201cmini\u201c research): prioritize actionable, commercially-licensable, locally-
runnable approaches over exotic SOTA needing huge compute or restrictive licenses.\n\nOUR
CONTEXT / CONSTRAINTS (ground every recommendation in these):\n- Self-hosted on a single
consumer GPU (RTX 2070 Super), Windows + WSL2. We want LOCAL-ONLY inference at runtime \u2014
privacy lever: user video never leaves the device. It's a commercial product, so PERMISSIVE /
commercial-friendly licenses are REQUIRED (avoid AGPL and non-commercial-only
weights/datasets).\n- Current substrate: WASB (MIT) shuttle-trajectory detector \u2192 per-frame
(x, y, visibility). We derive rally windows via velocity/merge-gap/min-duration thresholds plus
a net-crossing gate. We ALSO have a permissive person detector available (torchvision Faster
R-CNN + supervision ByteTrack) and the video's AUDIO track.\n- Current best approach: use paid
Gemini (cloud VLM, full-context) OFFLINE as a TEACHER to label rallies, then DISTILL into a
local model (logistic regression on shuttle-trajectory features). Findings so far: threshold-
tuning ceilings around F1 \u2014
```

=== SUMMARY ===

For a local-first, single-GPU, commercially-licensed badminton rally-segmentation pipeline, the

evidence does NOT crown the Gemini-teacher ? local-distillation approach as uniquely best; instead it points to a complementary, multi-cue local stack as the strongest direction. Three fully-local method families are each independently validated in racket sports: (a) audio hit detection (sub-millisecond impact timing; classical MFCC+GMM and lightweight CNNs run on CPU), (b) pose/court-geometry state machines for serve-ready START + shuttle-flight-gradient END (reported ~95% on the component steps), and (c) compact recurrent hit detectors (MonoTrack HitNet, ~16K params) that consume exactly the inputs we already have (shuttle trajectory + pose + court corners). The literature also confirms that audio-visual fusion measurably improves rally classification over either modality alone, that VLM/MLLM teachers are best used as training-time priors rather than runtime localizers (so our teacher?student framing is sound but not the only competitive path), and that SSL+KD distillation is a proven top-tier strategy. The single most actionable near-term lever, given our current substrate and the WASB recall bottleneck, is to add a fully-local AUDIO hit-detection cue and fuse it with the shuttle trajectory; pose/court-geometry serve-gating is the strongest second add. A major dataset caveat: ShuttleSet and the broadcast-CNN approaches are derived from BWF broadcast footage with replays/score graphics/director cuts, and their high reported numbers are per-frame classification, not IoU boundary accuracy ? they will not transfer cleanly to single-fixed-camera amateur video.

=== 12 VERIFIED FINDINGS ===

[1] conf=high vote=2-1 and 3-0

CLAIM: Pose + court-geometry state machines are a viable FULLY-LOCAL alternative for rally boundaries: serve-ready/serving stance (court-detail + pose features, classified by BiLSTM/CNN) marks rally START, and shuttlecock-flight gradient analysis marks rally END. Inputs are hand-engineered 12-frame x 26-feature (distance/angle/gradient/movement) matrices, not raw frames ? i.e., cheap to run locally with no large model.

SRC: https://link.springer.com/chapter/10.1007/978-3-031-69073-0_15;
<https://link.springer.com/article/10.1007/s42979-025-03935-0>

[2] conf=high vote=3-0

CLAIM: A compact recurrent hit detector (MonoTrack's HitNet) detects badminton hit events ? which segment a rally into successive strokes ? using a ~16K-parameter 2-layer GRU over a 12-frame sliding window of court corners + both players' poses + shuttle location. These are exactly the locally-available, permissive inputs our pipeline already has (shuttle trajectory + person/pose + court geometry), and the model is trivially runnable on our GPU.

SRC: <https://arxiv.org/html/2204.01899>

[3] conf=high vote=3-0

CLAIM: Audio-based hit detection is a high-resolution, fully-local cue for racket-sport hit timing. A two-stage energy-peak + small-CNN pipeline detects ball-racket contacts with sub-millisecond timing (peaks within ~0.2 ms even with noise; peak-detection precision 0.98, recall 0.95-1.0), and a classical MFCC+GMM pipeline (39-D MFCC, per-class GMMs, likelihood-ratio confidence) is CPU-light and applicable to detecting shuttle 'thwack' hits.

SRC: <https://arxiv.org/html/2409.11760v1>; https://www.researchgate.net/publication/261119682_Detection_of_ball_hits_in_a_tennis_game_using_audio_and_visual_information

[4] conf=high vote=3-0 and 2-1

CLAIM: Audio-only hit detection is only as good as its post-processing: naive raw-frame probabilities give a poor F-score (~41-50), but adding a simple likelihood-ratio confidence measure raises audio-only F-score to ~68-77 by cutting false positives. A standalone XGBoost impact classifier hits 0.98 median accuracy on isolated samples, but the full on-court system drops to ~85% ? real-world deployment degrades audio-only hit detection substantially.

SRC: https://www.researchgate.net/publication/261119682_Detection_of_ball_hits_in_a_tennis_game_using_audio_and_visual_information; <https://pmc.ncbi.nlm.nih.gov/articles/PMC11843912/>

[5] conf=high vote=3-0

CLAIM: Audio + visual fusion measurably improves rally vs non-rally classification over either modality alone ? supporting an audio cue we can run fully locally as competitive/complementary. In a tennis HMM, ball-hits + end-of-exchange applause are discriminative for rallies, and audio-visual fusion lifted rally RECALL to 83% (vs 54% visual-only, 63% audio-only) at near-unchanged precision. In soccer action spotting, late fusion gave best performance (+4.19% mAP spotting / +7.43% classification).

SRC: <https://www.irisa.fr/metiss/gravier/biblio/03/kijak-icme03.pdf>;
<https://arxiv.org/html/2505.03991v1>

[6] conf=high vote=3-0 and 2-1

CLAIM: VLM/MLLM teacher -> local-student distillation is a SOUND but not uniquely-best strategy. The recommended paradigm uses the MLLM only as a source of semantic priors/guidance to enhance a conventional weakly-supervised localizer at TRAINING time ? the MLLM is NOT the deployed runtime localizer ? which exactly matches our offline-Gemini-teacher -> local-student framing. Separately, SSL + knowledge distillation (COMEDIAN, 73.10 tight mAP on SoccerNet) is a proven top-tier action-spotting direction, validating distillation as a real approach rather than a workaround.

SRC: <https://arxiv.org/abs/2411.08466>; <https://arxiv.org/html/2505.03991v1>

[7] conf=high vote=3-0

CLAIM: Broadcast-style visual segmenters report very high numbers but are BROADCAST-specific and report per-frame, not IoU, accuracy ? a key transfer caveat for our single-fixed-camera amateur footage. A per-frame ResNet-18 CNN distinguishing broadcast rally frames from replays/close-ups hits F1 97.23 / Prec 98.06 / Rec 92.34 without any shuttle tracking, and a separate shot-angle-recognition trimming step hits 99% ? but both rely on broadcast artifacts (replays, score graphics, director cuts) absent in self-recorded video, and both impose the SAME min-3s-rally / min-3s-gap heuristics our pipeline already uses.

SRC: <https://arxiv.org/pdf/2308.12199>; <https://arxiv.org/pdf/2307.16000>

[8] conf=high vote=3-0

CLAIM: ShuttleSet is the leading permissive-context badminton dataset (104 sets, 3,685 rallies, 36,492 strokes, 44 matches 2018-2021; 18 shot classes + hitting/player locations per stroke), giving stroke-level structure for training/eval ? but it is derived from BWF broadcast footage, so it shares the broadcast-domain transfer caveat and its license must be confirmed before commercial use.

SRC: <https://arxiv.org/abs/2306.04948>; <https://dl.acm.org/doi/10.1145/3580305.3599906>

[9] conf=medium vote=3-0

CLAIM: Scoreboard/score-overlay OCR is a usable primary temporal-segmentation signal for point boundaries when a stable on-screen score exists: sample frames, OCR a fixed scorecard ROI, and declare an event when the recognized count increments vs the previous valid reading. It is fragile to occlusion/reformatting/absent overlays ? and is largely INAPPLICABLE to our amateur single-camera footage, which typically has no score overlay.

SRC: <https://arxiv.org/html/2510.18405>

[10] conf=high vote=3-0

CLAIM: Frame-exact Precise Event Spotting (PES) tolerances (~1-5 frames / 33-200 ms) are far tighter than coarse Action Spotting (5-60 s) ? but our rally start/end WINDOWING is closer to coarse AS, so we should NOT over-engineer for frame-exact precision when choosing methods.

SRC: <https://arxiv.org/html/2505.03991v1>; <https://arxiv.org/abs/2207.10213>

[11] conf=medium vote=synthesis

CLAIM: RANKED RECOMMENDATION for our local-first, permissive, single-GPU setup: Gemini-teacher -> local-distillation is a valid backbone but should be AUGMENTED, not relied on alone. Highest-leverage, cheapest local additions in order: (1) AUDIO hit detection (MFCC+GMM or energy-peak+small-CNN) fused with the shuttle trajectory ? directly attacks the WASB recall bottleneck using inputs we already have; (2) pose/court-geometry serve-ready gating for rally START + shuttle-flight-gradient for END; (3) a compact HitNet-style GRU on pose+trajectory+court as a learned segmentation primitive. All are MIT/permissive-compatible and CPU/GPU-light. Use Gemini purely as an offline TEACHER providing priors/labels, never at runtime.

SRC: <https://www.irisa.fr/metiss/gravier/biblio/03/kijak-icme03.pdf>;

<https://arxiv.org/html/2409.11760v1>

[12] conf=medium vote=synthesis

CLAIM: CONCRETE CHEAP NEXT EXPERIMENTS with what we already have (shuttle trajectory + person detector + audio): (E1) Extract the audio track, run energy-based peak detection (high-pass + EMA threshold) to get candidate impact timestamps, and overlay hit density on existing WASB windows ? measure whether audio hit-clusters recover the rally windows WASB misses (recall bottleneck) with zero new training. (E2) Add likelihood-ratio-style confidence post-processing to suppress audio false positives, since raw peaks alone are poor (~41-50 F) but LR post-processing reaches ~68-77 F. (E3) Build a tiny audio+trajectory feature fusion (add audio-hit-rate / time-since-last-hit / applause-energy as features to the existing logistic-regression distillation student) and re-eval at IoU 0.5. (E4) Use the person detector to add a coarse serve-ready-stance / both-players-in-court gate at window boundaries (proxy for the pose state

machine) without a full pose model.

SRC: <https://arxiv.org/html/2409.11760v1>; https://www.researchgate.net/publication/261119682_Detection_of_ball_hits_in_a_tennis_game_using_audio_and_visual_information

=== CAVEATS ===

DOMAIN-TRANSFER is the dominant caveat: nearly every high accuracy figure comes from BWF/tennis/soccer BROADCAST footage (replays, score graphics, director cuts, multi-camera) or curated lab audio. Our target is single-fixed-camera amateur video with no replays and likely no score overlay, so the broadcast-CNN (97-99%) and scoreboard-OCR methods will degrade or be inapplicable, and audio results (mostly tennis/table-tennis with heavier/louder balls) face a weaker-SNR shuttle 'thwack' transfer problem. METRIC MISMATCH: the headline numbers are almost all PER-FRAME classification or per-component accuracy, NOT the IoU-0.5 boundary F1 our project is judged on ? direct comparison to our ~0.44 ceiling is invalid (one such comparison claim was refuted 0-3). VOTE/EVIDENCE WEAKNESS: claims about pose-state-machine headline accuracy, audio-CNN superiority over classical methods, and automatic-audio reliability had split or refuted votes; the cloud-VLM->tiny-student 'is best' framing is NOT directly evidenced (COMEDIAN's KD is self-distillation, not VLM->student). LICENSE GAP: ShuttleSet's specific commercial-license terms and MonoTrack/HitNet weight licenses were not confirmed in the surviving claims and MUST be verified before any commercial use. CROSS-SPORT EXTRAPOLATION: fusion-lift magnitudes vary wildly (+0.19 to +7.43 mAP depending on model), so predicted gains for badminton are hypotheses, not guarantees. TIME-SENSITIVITY: action-spotting SOTA (ASTRA, T-DEED) moves fast, so 'top-tier' rankings are as-of-2024-2025.

=== OPENQUESTIONS ===

```
[
  "What is ShuttleSet's exact license, and is it (and any pretrained TrackNet/WASB/MonoTrack-HitNet weights) cleared for COMMERCIAL use? This is a hard product requirement and was not confirmed in the surviving claims.",
  "How well does audio shuttle-'thwack' detection actually work on REAL amateur single-camera badminton audio (weaker/quieter impacts, crowd/gym reverb) \u2014 does the tennis/table-tennis ~73-77 F audio-only ceiling hold, degrade, or improve for badminton?",
  "On OUR footage and at IoU 0.5, does adding audio (and/or a pose serve-gate) actually fix the WASB candidate-RECALL bottleneck, or does WASB simply miss the underlying trajectory regardless of how rally windows are derived?",
  "Given we are data-starved (n=2 labeled videos), what is the most label-efficient path: more Gemini-teacher labels, weak-supervision from audio/pose heuristics, or a small hand-labeled golden set \u2014 and which yields the biggest IoU-0.5 lift per labeling hour?"
]
```

480. assistant (2026-06-06T17:44:57.494Z)

Got the full verified report (23 sources, 110 claims ? 25 verified, 6 killed, 12 final findings). Let me save it as a durable doc, then post the synthesis.

481. assistant (2026-06-06T17:45:19.419Z)

Rally-detection methods ? research (2026-06-06)

Deep-research survey (23 sources, 110 claims ? 25 adversarially verified, 6 refuted, 12 final findings)
 on alternative ways to find rally start/end in racket-sport video, for our **local-first**, permissive, single-GPU pipeline. Question: is Gemini-teacher ? local-distillation the best, or are there competitive/complementary methods?

Verdict

Teacher?student distillation is **sound but NOT uniquely best**. The evidence points to a **complementary multi-cue LOCAL stack**. VLM/MLLM teachers are validated specifically as **training-time priors**, not runtime localizers ? which is exactly our offline-Gemini framing. The single highest-leverage near-term lever is to **add a fully-local AUDIO hit-detection cue and fuse it with the shuttle trajectory**; pose/court serve-gating is the strong #2.

Three fully-local, permissive, competitive method families

- Audio hit detection (shuttle "thwack")** ? top cheap lever. **Energy-peak + small-CNN** gives sub-ms impact timing (peak precision ~0.98, recall ~0.95+); classical MFCC+GMM is CPU-light. ? Only as good as its post-processing: raw peaks ~41?50 F-score ? **likelihood-ratio confidence** raises audio-only to ~68?77%; fully-automatic on-court systems degrade (~85%, and one tennis system hit 46% precision). Mostly validated on tennis/table-tennis (louder balls) ? shuttle SNR transfer is an open risk.
- Pose + court-geometry state machine** (= our "gate B" idea, validated). Serve-ready stance (court+pose features, BiLSTM/CNN over a 12x26 hand-engineered matrix) ? rally **START**; shuttle-flight gradient (?80% consecutive no-motion frames) ? rally **END**. Cheap (engineered features, no big model).

3. **Compact HitNet GRU** (MonoTrack, ~16K params, 2-layer GRU over 12-frame window of court corners + both players' poses + shuttle xy) ? consumes exactly our available inputs; trivially runnable. Detects **strokes** (a segmentation primitive), not whole rallies.

Key supporting evidence

- **Audio+visual fusion beats either alone:** tennis HMM rally **recall 83% (fused) vs 54% visual / 63% audio**
 - at ~unchanged precision; soccer late-fusion +47% mAP. This is the core case for adding audio.
- **Distillation is legit:** MLLM4WTAL uses the MLLM as a training-time prior only; SSL+KD (COMEDIAN) is top-tier action-spotting. Our teacher?student is a valid backbone.
- **Our windowing is "coarse action spotting" (5?60 s tolerance), not frame-exact PES** ? don't over-engineer for frame precision.

? Caveats (honest)

- **Domain transfer:** nearly all high numbers come from **BWF/tennis BROADCAST** footage (replays, score graphics, director cuts) or curated lab audio. Our target is single-fixed-camera amateur video ? broadcast CNNs (97?99%) and scoreboard-OCR are inapplicable/degrade.
- **Metric mismatch:** headline numbers are **per-frame / per-component accuracy**, NOT IoU-0.5 boundary F1.
 - The "~95% beats your 0.44" comparison was **refuted (0-3)** ? not comparable.
- **License gap (hard product req):** ShuttleSet, MonoTrack/HitNet weights, and WASB **weights** commercial terms were NOT confirmed ? must verify before commercial use. (WASB code = MIT; weights = academic-trained.)
- Scoreboard/score-overlay OCR: usable only when a stable on-screen score exists ? mostly N/A for amateur clips.

Datasets

- **ShuttleSet** ? 104 sets / 3,685 rallies / 36,492 strokes / 44 BWF matches (2018?21), 18 shot classes + hitting/player locations. Stroke-level structure for train/eval, but broadcast-domain + license TBD.

Ranked recommendation (local-first, permissive, single-GPU)

Gemini-teacher ? local-distillation is a valid **backbone** to AUGMENT, not rely on alone.
Cheapest local adds, in order: **(1) audio hit detection fused with trajectory** (attacks the WASB recall bottleneck with inputs we already have); **(2) pose/court serve-ready START + flight-gradient END gating**; **(3) a compact HitNet-style GRU** on pose+trajectory+court. All MIT/permissive-compatible and CPU/GPU-light. Keep Gemini offline-only.

Concrete cheap next experiments (with what we already have)

- **E1 ? audio recall probe:** extract audio ? energy-peak detection (high-pass + EMA threshold) ? candidate impact timestamps ? overlay hit density on existing WASB windows ? does audio recover rallies WASB misses?
 - (zero new training; directly tests the recall bottleneck.)
- **E2 ? audio FP suppression:** add likelihood-ratio confidence (raw peaks ~41?50 F ? ~68?77 F).
- **E3 ? fuse into the distillation student:** add audio-hit-rate / time-since-last-hit / applause-energy as features to the logistic-regression student ? re-eval at IoU 0.5.
- **E4 ? pose-free serve gate:** use the existing person detector for a coarse "both players settled in court" gate at window boundaries (proxy for the pose state machine, no pose model needed).

Open questions

1. ShuttleSet / MonoTrack-HitNet / WASB-weights ****commercial license**** terms (hard requirement).
2. Does shuttle-"thwack" audio detection hold on ****real amateur single-camera**** badminton (weaker SNR, gym reverb), or degrade below the tennis ~73% F audio-only ceiling?
3. On OUR footage at IoU 0.5, do audio/pose cues actually fix the ****WASB recall**** bottleneck ? or does WASB miss the underlying trajectory regardless of how windows are derived?
4. Most label-efficient path given n=2: more Gemini labels vs audio/pose weak-supervision vs a small hand-labeled golden set ? biggest IoU-0.5 lift per labeling hour?

Research posted ? rally-detection methods

Full cited report saved to docs/RALLY_DETECTION_RESEARCH.md (23 sources, 110 claims ? 25 adversarially verified, 6 refuted). The headline:

****Verdict: teacher?student is sound but *not* uniquely best.**** The literature actually validates our exact framing (VLM as an ***offline training-time prior***, not a runtime localizer) ? but it says the strongest direction is to ****augment**** it with a complementary ****fully-local multi-cue stack****, not rely on distillation alone.

****Three local, permissive, competitive cues ? ranked by leverage for us:****

1. ****? Audio hit detection (shuttle "thwack") ? the #1 cheap lever.**** We're ignoring the audio track entirely, and it's a high-resolution rally signal. The killer evidence: in a tennis system, audio+visual ****fusion lifted rally recall to 83% vs 54% visual-only**** ? and ***recall*** is exactly our WASB bottleneck. CPU-light (MFCC+GMM or energy-peak+small-CNN). Caveat: needs likelihood-ratio post-processing (raw peaks are weak, ~41% F ? ~68% F).
2. ****? Pose/court serve-gate**** ? this is ***literally our "gate B" idea, validated***: serve-ready stance ? START, shuttle-flight-gradient ? END. We can prototype a cheap version with the person detector we already have (no pose model).
3. ****? Compact HitNet GRU**** (~16K params, MonoTrack) on pose+trajectory+court ? a learned stroke primitive.

****Honest caveats it surfaced (important):****

- Almost every flashy number (95%99%) is from ****broadcast**** footage with replays/score-graphics and is ****per-frame accuracy, not IoU boundary F1**** ? it will ****not**** transfer cleanly to your single-camera amateur clips. (The "95% beats your 0.44" claim was explicitly ***refuted*** as a metric mismatch.)
- ****License gap (hard req):**** ShuttleSet, MonoTrack/HitNet weights, and even the WASB ***weights***

commercial terms are unconfirmed ? must verify before commercial use.

****Cheapest next experiments (zero/low new training, all in the doc):**** E1 ? extract audio, energy-peak the impacts, overlay hit-density on WASB windows and measure whether audio *recovers the rallies WASB misses* (directly tests the recall bottleneck). E3 ? add audio features (hit-rate, time-since-last-hit, applause-energy) to the distillation student and re-eval at IoU 0.5.

Net: when we resume, ****adding audio is the highest-ROI move****, and your ****pose serve-gate instinct was right****. Both run fully local.

The ****VLC annotator**** workflow (`w6nwcw33`) is still building ? I'll post the plugin + install steps when it lands, then we're parked for your rating. (docs/RALLY_DETECTION_RESEARCH.md is uncommitted on master ? say the word and I'll commit it.)

<status>completed</status>
<summary>Dynamic workflow "Feasibility + build a VLC Lua plugin that marks rally start/end +
stop-reason while watching, emitting a collector-ingestable CSV" completed</summary>
<result>{"feasible":true,"verdict":"Feasible as a VLC 3.x Lua EXTENSION using only confirmed
APIs. A persistent button-driven dialog (Mark START / ending_reason dropdown / Mark END / Undo +
a live status label) snapshots vlc.var.get(vlc.object.input(),\"time\")/1e6 (microseconds -&gt;
decimal seconds) and appends rally_number,start_time,end_time,ending_reason rows via Lua io. The
CSV is consumed unchanged by this repo's golden loaders (backend/eval/calibrate_wasb.py,
backend/tools/rally_slicer.py) and by the collector's `import-local`. True auto-popup-on-pause
is intentionally NOT used (flaky on macOS #22778, broken in VLC 4.0 #27558). Verified live: VLC
binary is 3.0.23; %APPDATA%\vlc\lua exists (extensions subfolder must be created); home is
C:\Users\avidu; loaders DictReader+lowercase the header and read decimal-seconds
start_time/end_time, tolerating extra columns.\""},\"approach\":\"Button-dialog, not a pause-hook. The
button-click model is event-driven (VLC invokes each button's callback on its main loop), so it
never blocks VLC the way a polling loop in activate() would (keep_alive() only resets the
watchdog, it cannot make a loop responsive). It is portable: the {\"playing-
listener\"}/status_changed pause callback is unreliable on macOS (VLC #22778) and the input/meta
listeners are broken in VLC 4.0 (#27558), so the extension declares NO listener capabilities. It
is also more precise and ergonomic: the rater can pause and scrub to the exact frame, THEN press
Mark START / Mark END, instead of being forced to commit a time at whatever instant a pause
fires. Each callback reads vlc.var.get(input,\"time\") (microseconds in 3.x) and divides by 1e6
for the decimal seconds the collector requires.\"\"},\"alternatives\":\"If VLC's grid dialog feels
cramped or you want true keyboard-driven marking, two non-VLC options are stronger. (1) A
standalone python-vlc + Tkinter (or PyQt) app: embed libVLC for playback and bind single keys
(e.g. S=start, E=end, 1-6=reason, U=undo, space=pause), reading position via player.get_time()
(milliseconds) and writing the same CSV. This is better when you want global hotkeys, a frame-
step button, a live editable table of marked rallies, or batch processing many files -- at the
cost of shipping a Python app instead of dropping one .lua file. (2) An HTML5 player page (a
local &lt;video&gt; element + JS keyboard shortcuts, exporting CSV via a download blob): zero
install beyond a browser, trivially shareable with remote raters (e.g. the Roora vendor), and
easy to add frame-accurate stepping (video.currentTime +/- 1/fps); best when annotation is
outsourced or done on machines where installing VLC plugins is awkward, but it needs the video
served/loaded into the browser and is less convenient for very large local files. The VLC
extension wins for a single local rater who already lives in VLC (and already runs the timeosd
overlay) -- it is the lowest-friction v1.\"\"},\"verify_issues\":[\"VLC API ? ALL CORE CALLS VERIFIED
CORRECT (no invented functions): vlc.object.input() (input obj), vlc.var.get(input,\"time\")
returns MICROSECONDS so /1e6 is correct, vlc.input.item() + item:uri() are the right VLC 3.x
accessors (vlc.player.item() is the VLC 4.0 form), vlc.dialog/show/delete/update,
add_label/add_button/add_dropdown, dropdown add_value(text,id) + get_value() returning (id,
text), label set_text, and vlc.deactivate(). Verified against the VLC Lua dialog docs
(vlc.verg.ca), the verghost extensions reference, and the nima64 VLC-3 guide.\"\"},\"TIME UNITS:
correct. vlc.var.get(input,\"time\") is microseconds in 3.x; dividing by 1e6 yields decimal
seconds, which is exactly what the collector/loaders expect. No bug.\"\"},\"DROPDOWN get_value():
correct. add_value(v, i) registers (text=reason, id=index); get_value() returns (id, text); the
```

code takes the 2nd return (`local \_, reason = w\_reason:get\_value()`) = the reason STRING. Correct mapping verified.", "CSV CONTRACT: matches the in-repo loaders EXACTLY. Header `rally\_number,start\_time,end\_time,ending\_reason`, decimal seconds with %.3f. backend/eval/calibrate_wasb.py load_golden_gts and backend/tools/rally_slicer.py load_rally_labels both use csv.DictReader, lowercase headers, parse start_time/end_time as float, and drop end<=>start. The 6 ending_reason values (winner/forced_error/unforced_error/service_fault/let/other) match the docs/GOLDEN_SET_VENDORING.md taxonomy. backend/eval/annotations.py also tolerates the start_time header. No mismatch.", "FIXED (real data bug) ? duplicate rally_number on re-enable: activate() reset rally_count=0 while append() keeps appending to the existing CSV, so re-enabling the extension restarts numbering at 1 and writes duplicate rally_number keys (rally_slicer keys a dict on rally_number, so dupes silently overwrite). Fixed by seeding rally_count = max existing integer rally_number scanned from the file (new_max_existing_rally()).", "FIXED (display robustness) ? multi-line status used \\n in an add_label widget; the Qt label does not honor \\n as a line break, so status could render as one run-on line on some builds. Switched the status widget to add_html (confirmed to have set_text and render basic HTML), using
 line breaks and , and HTML-escaping the path/messages (new esc()) so backslashes/specials render literally.", "FIXED (cosmetic) ? removed the ... from the plain add_label (add_label is documented as plain text; only add_html is rich text), avoiding literal tags showing on some builds.", "CLARIFIED (swap branch) ? the END-before-START tolerance had an inner guard `if s <= e` nested inside `if e <= s`, which is only true when e==s; rewrote it as the clearer `if e == s` (degenerate -> reject; e<s -> swap to a positive interval). Behavior is unchanged but now obvious. Note: silently swapping an END marked earlier than START is a debatable UX choice (kept, since it is documented and always yields a valid positive interval).", "INSTALL DOC corrected ? the `python -m src.cli.curate import-local ... --annotations-path` command does NOT exist in THIS repo; it belongs to the separate sports-data-collector repo (per project memory). Re-anchored the ingest section on the actually-present in-repo consumers (backend/eval/calibrate_wasb.py --labels and backend/tools/rally_slicer.py --labels), and demoted the collector command to a clearly-labeled 'other repo' note.", "Lifecycle: correct. activate/deactivate/close defined; close() calls deactivate() then vlc.deactivate() (standard teardown); button callbacks are GLOBAL functions (required ? VLC looks them up by name). capabilities={} (no listeners) is valid for a button-only extension and no keep_alive/interval loop is needed.", "UX edge cases checked: END before START -> handled (reject equal, swap negative); double START -> latest START wins (re-arms), acceptable; Undo -> disarms an uncommitted START, else truncates the last appended row (one level, blanks file when only header remains); append-not-overwrite -> file opened 'a' and header written only when file absent; concurrent open -> file is opened+closed per write (no held lock), safe.", "Non-blocking minor notes (left as-is): percent-decode is byte-wise via string.char (UTF-8 filenames decode byte-by-byte, fine on matching code page); path-stem regex handles dotted filenames acceptably (match.2.mp4 -> match.2.rallies.csv); ending_reason is written verbatim and not validated by the importer (downstream QA enforces the closed vocab, as the doc already states).", "verify_confidence": "high", "final_lua": "--[[rally_annotator.lua -- VLC Lua EXTENSION (v1.1)\\n\\n Mark badminton rally START / END + a point-stop reason while watching, and\\n append one CSV row per rally that this repo's golden-set loaders (and the\\n separate sports-data-collector `import-local` command) ingest directly.\\n\\n Output CSV columns (decimal SECONDS):\\n rally_number,start_time,end_time,ending_reason\\n\\n WHY a button-dialog (not an auto-... (truncated 15517 chars, full result in C:\\Users\\avidu\\AppData\\Local\\Temp\\claude\\C--Users-avidu-Projects-badminton-highlight-indexer\\42211f80-2169-4025-ad9d-99c1aa29ff70\\tasks\\w6nwcw33.output)</result><usage><agent_count>5</agent_count><subagent_tokens>303202</subagent_tokens><tool_uses>91</tool_uses><duration_ms>855465</duration_ms></usage></task-notification>

486. assistant (2026-06-06T17:47:14.445Z)

VLC plugin is built, **feasible: true, high confidence** ? and the verify pass earned its keep again (caught a real duplicate-`rally\_number` bug on re-enable, a multi-line label rendering issue, and an install-doc error that pointed `import-local` at the wrong repo). Let me extract the verified files, save them to the repo, and install the plugin straight into your VLC so you can start rating immediately.

487. user (2026-06-06T17:47:18.903Z)

repo files written | lua 11398 chars | md 3613 chars

confidence: high

first 12 lua lines:

```
--[[ rally_annotator.lua -- VLC Lua EXTENSION (v1.1)
```

Mark badminton rally START / END + a point-stop reason while watching, and append one CSV row per rally that this repo's golden-set loaders (and the separate sports-data-collector `import-local` command) ingest directly.

Output CSV columns (decimal SECONDS):

rally_number,start_time,end_time,ending_reason

WHY a button-dialog (not an auto-pause hook):

VLC 3.x can expose pause via the {"playing-listener"} capability (status_changed/playing_changed), but that callback is flaky on macOS

488. assistant (2026-06-06T17:47:27.876Z)

Repo files written (11.4 KB plugin, high confidence). Now installing it into your VLC so it's ready on next launch:

489. user (2026-06-06T17:47:31.102Z)

```

186:  local f = io.open(out_path, "rb")
```

490. assistant (2026-06-06T17:47:52.480Z)

Installed and sane (descriptor, `vlc.object.input()`, microsecond?seconds `/1e6`, the correct CSV header ? all present). Let me read the README to relay the exact usage.

491. user (2026-06-06T17:47:52.499Z)

```
1      # Badminton Rally Annotator (VLC extension) -- install & usage
2
3      ## 1. Install (Windows)
4      1. Create the folder if it does not exist:
5          `C:\Users\<you>\AppData\Roaming\vlc\lua\extensions\`
6          (i.e. `%APPDATA%\vlc\lua\extensions\`).
7      2. Copy `rally_annotator.lua` into that folder.
8      3. In VLC: **Tools -> Plugins and extensions -> Reload extensions**
9          (or just restart VLC). Requires VLC 3.0.x (tested target 3.0.x).
10     4. Enable it from the **View** menu -> **Badminton Rally Annotator**.
11         The dialog appears (it stays open while you watch).
12
13     > Tip: if you run the `timeosd` interface
14     > (`%APPDATA%\vlc\lua\intf\timeosd.lua`) you also get a live on-screen clock
15     > while you mark -- the two work together.
16
17     ## 2. Rate workflow
```

```

18 1. Open the badminton video in VLC and start playback. Pause/scrub freely.
19 2. When a rally begins, click Mark START (snapshots the current time).
20 3. Pick the point-stop reason in the Ending reason dropdown
21 (winner / forced_error / unforced_error / service_fault / let / other).
22 4. When the rally ends, click Mark END -- one CSV row is appended
23 immediately. The dropdown value at that moment is what gets written.
24 5. Made a mistake? Undo last disarms an uncommitted START, or removes the
25 last written row (one level of undo).
26 6. The status panel shows: last action, current time, whether a START is armed,
27 rallies written, and the CSV output path.
28
29 Output path: written next to the video as <video-stem>.rallies.csv
30 when VLC can resolve the file path; otherwise it falls back to your home dir
31 (%USERPROFILE%\rally_labels.csv). The exact path is always shown in the dialog.
32
33 CSV format: header rally_number,start_time,end_time,ending_reason,
34 times in decimal seconds. Re-enabling the extension keeps appending to the
35 same file (it does not truncate) and continues rally numbering from the
36 highest number already in the file, so you never get duplicate rally_number's.
37
38 ## 3. Ingest with the in-repo loaders
39 The CSV is consumed unchanged by this repo's golden-set tooling, which reads
40 start_time/end_time (decimal seconds) via csv.DictReader and drops any
41 row with end <= start:
42
43 ```
44 # Per-video WASB calibration against your labels:
45 python -m backend.eval.calibrate_wasb --trajectory full_traj.csv \
46     --labels "C:\path\to\match.rallies.csv" --fps 59.94 --frame-width 1920
47
48 # Slice rally clips out of the match to eyeball boundaries:
49 python -m backend.tools.rally_slicer --video "C:\path\to\match.mp4" \
50     --labels "C:\path\to\match.rallies.csv" --rallies all
51 ```
52
53 > Other repo: the separate sports-data-collector repo exposes an
54 > import-local command for the same CSV; that command does not live in
55 > this repository, so run it from the collector checkout:
56 > python -m src.cli.curate import-local --sport badminton --video-path ...
57 --annotations-path match.rallies.csv.
58
59 ## 4. Notes & gotchas
60 - VLC's time is in MICROSECONDS; the extension divides by 1e6 -> seconds.
61 - It does not auto-react to pause on purpose (that callback is broken in VLC 4.0
62   and flaky on macOS). You explicitly click START/END, which is more precise.
63 - Keep ending_reason to the 6 dropdown values -- downstream QA enforces the
64   closed vocabulary; the loaders carry it verbatim and do not validate it.
65 - A rally must be > 0s: if END is at/before START it is either rejected (equal)
66   or swapped to a positive interval (END earlier than START), keeping the file
67   free of degenerate rows the loaders would drop anyway.
68 - The status panel is a rich-text (HTML) widget, so multi-line output renders
69   reliably across VLC 3.x Qt builds.

```

492. assistant (2026-06-06T17:48:07.551Z)

Done ? the **VLC Rally Annotator** is built, verified, and installed into your VLC (`%APPDATA%\vlc\lua\extensions\rally_annotator.lua`), with source + README in `[tools/vlc_rally_annotator/](tools/vlc_rally_annotator/README.md)`. Let me log it, then hand you the usage.

493. user (2026-06-06T17:48:14.140Z)

The file `C:\Users\avidu\claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md` has been updated successfully. (file state is current in your

context ? no need to Read it back)

494. assistant (2026-06-06T17:48:32.093Z)

? VLC Rally Annotator ? ready to use

****Built, verified (high confidence), and installed.**** Restart VLC (or ****Tools ? Plugins and extensions ? Reload extensions****), then enable it from the ****View menu ? "Badminton Rally Annotator"**.**

****Rate workflow:****

1. Open a badminton video, play/scrub freely.
2. At a rally's first serve ? ****Mark START**** (snapshots the exact time).
3. Pick the ****Ending reason**** in the dropdown (winner / forced_error / unforced_error / service_fault / let / other).
4. At rally end ? ****Mark END**** ? one row is appended instantly. ****Undo last**** fixes mistakes (one level).

****Output:**** `<video-stem>.rallies.csv` next to the video, columns `rally_number, start_time, end_time, ending_reason` in decimal seconds. Re-enabling keeps appending and ****continues numbering**** (no duplicate IDs ? that was a bug the verify pass caught and fixed). The dialog always shows the live path + rally count.

****It ingests unchanged**** into:

- ``python -m backend.eval.calibrate_wasb --labels <your>.rallies.csv ...`` (calibration/distillation)
- ``python -m backend.tools.rally_slicer --labels <your>.rallies.csv --rallies all`` (eyeball clips)
- the collector's ``import-local`` (separate repo)

****Honest caveat:**** it's verified against the real VLC 3.x Lua API and your CSV loaders, but I can't click through VLC myself ? so the first launch is your smoke test. If a button misbehaves, paste the error and I'll fix the v1.1. (Deliberately button-driven, not auto-on-pause ? that VLC callback is flaky on macOS / broken in VLC 4, and clicking lets you scrub to the exact frame first.)

****If the grid dialog feels cramped:**** the workflow flagged two stronger alternatives ? a python-vlc+Tkinter app with global hotkeys (S/E/I?6/U), or an HTML5 page (zero-install, shareable with remote raters like Roora). Say the word and I'll build either.

Both background workflows are now complete. ****Net state:**** master clean (all PRs merged), modeling parked, research posted (docs/RALLY_DETECTION_RESEARCH.md ? TL;DR: ****add audio****, it's the #1 cheap local lever and attacks your recall bottleneck), and you now have the ****annotator to generate the golden data**** that unblocks everything. Two uncommitted docs/tools on master (the research doc + the annotator) ? say the word and I'll commit them. Go rate some rallies. ?

495. user (2026-06-07T01:18:18.876Z)

Amazing development while I was dream sunk! Good morning to you! Can you make a detailed plan on audio for now? Stance detection would be the second, but I think I may have another hunch before we dive into that (and I believe it will be substantially tougher to get right). Additionally please check in the research in a detailed way and document this decision (adding audio, parked stance for next)

The videos I have given for analysis, all had video because GoPro records the audio also but I am not sure about the efficacy of it. But I can make "enable audio always" as a requirement in the docs which highlight how to setup the camera in order to get a great highlight.

496. assistant (2026-06-07T01:19:20.220Z)

Good morning! ? Glad the overnight run was productive. Let me ground this properly: audio is now

the committed direction, so I'll (1) write a detailed audio plan, (2) document it as an ADR, (3) commit the research, and (4) bake "audio always on" into the recording guidelines. First let me read the existing decision/guideline docs so I match their format and ADR numbering.

497. user (2026-06-07T01:19:21.209Z)

```
1      # Architecture Decision Records
2
3      ## ADR-001: Precise shuttle tracking via self-hosted TrackNetV4/WASB on WSL2
4
5      **Date:** 2026-05-25
6      **Status:** Accepted
7
8      ### Context
9
10     The pipeline uses an AI multimodal provider (Gemini) for *semantic* rally segmentation.
11     We need **precise frame-level detection of the moving shuttlecock** (and, generically,
12     balls for other sports) to produce higher-quality candidate rallies and a fine-tuning
13     signal.
14
15     We evaluated whether a commercially available model/API could do this. Findings:
16
17     - **Multimodal LLM APIs (Gemini, Claude, GPT-class) are the wrong tool for precise
18       localization.** They reason well about *what* is happening (rally vs. dead time) but
19       cannot reliably track a tiny, fast (~up to 400 km/h), motion-blurred shuttle frame by
20       frame.
21     - The precision leaders are **purpose-built trajectory models**, which are open source
and
22       self-hosted, not big-vendor APIs:
23     - **TrackNetV4** (TensorFlow) ? badminton-specific, heatmap + motion-attention,
24       highest reported shuttle accuracy; ships `src/predict.py` producing per-frame (X, Y)
25       coordinate CSV. https://github.com/AR4152/TrackNetV4
26     - **WASB** (PyTorch) ? multi-sport strong baseline (badminton/tennis/volleyball/?),
27       fits our `SportProfile` abstraction; needs a custom-video inference wrapper.
28       https://github.com/nttcom/WASB-SBDT
29     - True turnkey commercial APIs (Roboflow hosted models) exist but cap below a tuned
30       TrackNet; enterprise systems (Hawk-Eye, SkillCorner, TRACAB) are not API-accessible.
31
32     ### Decision
33
34     1. Adopt **self-hosted TrackNetV4** as the primary precise shuttle detector, with
**WASB**
35       as the multi-sport fallback.
36     2. Run these models under **WSL2 (Ubuntu)**, **not** native Ubuntu. The entire indexer
37       already runs on Windows; WSL2 keeps a single dev environment and quarantines the
38       TensorFlow/PyTorch dependencies. Native Ubuntu would require dual-boot and migrating
39       the whole project for marginal gain.
40     3. Integrate via a **subprocess adapter**: a detector module that shells out to the WSL
41       `predict.py`, reads the coordinate CSV, and converts trajectory ? candidate rallies
42       feeding the existing stitching flow. This keeps the TF dependency fully isolated from
43       the main Python environment.
44
45     ### Consequences
46
47     - **WSL I/O caveat:** `/mnt/c` access is slow. Stage match videos inside the WSL
48       filesystem (e.g. `~/clips/`) before inference rather than reading large mp4s across
the
49       Windows?WSL boundary.
50     - TrackNetV4 (TensorFlow) and WASB (PyTorch) live in **separate conda envs**.
51     - Next step after integration: manual video annotation ? fine-tune the detector.
52
53     ---
54
55     ## ADR-002: Use the sports-data-collector's rally annotations as a golden eval +
temporal-segmenter training set
```

```

56
57 **Date:** 2026-05-26
58 **Status:** Accepted
59
60 ### Context
61
62 A sibling project, sports-data-collector, curates sports videos and stores per-rally
63 `[start, end)` timestamps (plus stroke counts, scores) in an SQLite DB, with a
64 commercial-license flag per source. We asked whether this data could improve the
65 indexer's rally detection, and for which task.
66
67 Key findings:
68
69 - The annotations are temporal-only (when rallies start/end). They do not
contain
70 per-frame shuttle `(x, y)` coordinates, so they cannot train the shuttle detector**
71 (TrackNetV4/WASB ? see ADR-001), which needs coordinate labels.
72 - They are an excellent golden evaluation set and a training signal for the
73 temporal rally segmenter** (active vs. dead play over time) ? the stage that is
today
74 a hand-tuned heuristic, not a learned model.
75 - The collector's five sports tables (`badminton_rallies`, `tennis_points`,
76 `cricket_deliveries`, `pickleball_rallies`, `tabletennis_rallies`) all share a
77 `(video_id, ordinal, start_time, end_time)` shape, and the indexer already has
78 `sport_registry` / `segmenter_registry`. So a generic `(start, end)` bridge serves
79 every sport.
80 - The two repos key videos differently: the collector by a human `video_id`, the indexer
81 by file MD5. A re-encode/re-download changes the bytes, hence the MD5.
82
83 ### Decision
84
85 1. Treat the collector's rally timestamps as (a) the golden eval set for rally
86 segmentation and (b) the labels for training a temporal segmenter ? explicitly
87 not as shuttle-detector training data.
88 2. Bridge the repos with a sport-agnostic export (`curate export` in the collector):
89 per-video `start,end` CSVs (the indexer's eval format) + a `manifest.json` that pairs
90 each CSV with its video file. Gate on `is_commercial` so only commercially usable
data
91 flows through.
92 3. Honour the MD5 keying contract: evaluation/processing must run on the exact video
93 file recorded in the manifest; acquisition (ADR-003) therefore precedes processing.
94
95 ### Consequences
96
97 - The collector becomes the producer of labels; the indexer the consumer (processing
+
98 scoring + training). Neither takes a hard dependency on the other beyond the manifest.
99 - Scoring is free and deterministic (reads the DB; no API). See `docs/EVALUATION.md`.
100 - Only invest in frame-level coordinate labels (for the detector) if evaluation
shows
101 detection, not segmentation, is the bottleneck.
102
103 ---
104
105 ## ADR-003: Video acquisition ? always best resolution, upgrade in place, authenticated
cookies
106
107 **Date:** 2026-05-26
108 **Status:** Accepted
109
110 ### Context
111
112 The collector's initial crawl downloaded videos with `yt-dlp -f worstvideo` (256x144),
113 mislabelled as 1080p. The indexer needs 720p MP4 for meaningful YOLO/shuttle detection.
114 Re-acquiring full-resolution sources surfaced several hard-won realities:

```

```

115
116 - The ShuttleSet corpus **tops out at 1080p** (no 4K); "best available" resolves to
1080p.
117 - Authenticating with a **YouTube Premium** account is required for reliable,
unthrottled
118 downloads ? anonymous downloads are throttled (~1.3 MiB/s) and **non-deterministic**
119 (identical commands variously yielded 1080p DASH, 1080p HLS, or a 144p fallback).
120 - **Chrome** cookies can't be read on Windows (app-bound encryption / DPAPI, yt-dlp
121 #10927); **Firefox** cookies read cleanly even while open.
122 - The `web`/`web_safari` player clients are forced into **SABR streaming**, which strips
123 download URLs and silently drops to 144p (yt-dlp #12482). yt-dlp's `default` client
124 serves real downloadable 1080p DASH with auth cookies.
125 - Bulk bursts trip YouTube **rate-limiting** (a 22-video burst failed all at once,
though
126 each worked in isolation).
127
128 ### Decision
129
130 1. **Always fetch the best resolution available** (`bv*+ba/b -S res,...`, merged to
MP4);
131 ffprobe the result and store the *actual* width/height/fps ? never assume.
132 2. **Upgrade in place, never clean-slate:** the `fetch` command re-downloads a video and
133 updates only `local_path`/`resolution`/`fps`, preserving every rally annotation and
134 curation status (deleting would cascade-delete the valuable labels).
135 3. Use **authenticated cookies** (`--cookies-from-browser firefox` / `--cookies file`)
and
136 the **`default` player client**; enable the EJS challenge solver (deno).
137 4. **Throttle bulk runs** (`--sleep` + per-video `--retries`/`backoff`) and treat a
138 below-min-height download as a **failure** (discard, don't commit) so a flaky low-res
139 result never overwrites a good entry.
140
141 ### Consequences
142
143 - All 22 fetchable ShuttleSet matches are now true 1080p (one match, shuttleset_12, has
no
144 source URL in the catalog and remains video-less but keeps its annotations).
145 - Acquisition is reproducible and resumable; the ~26 GB corpus is kept outside git.
146 - Future non-YouTube or 4K sources are supported by the same code (optional
`max_height`).
147
148 ---
149
150 ## ADR-004: Add an offline, API-free *learned* rally segmenter as a first-class mode
151
152 **Date:** 2026-05-26
153 **Status:** Proposed (substrate pending data)
154
155 ### Context
156
157 The default high-quality path (`yolo_hybrid`) refines YOLO candidate windows with
**Gemini**,
158 which costs money and requires network access. With a now-1080p, commercially-licensed,
159 rally-annotated corpus (ADR-002/003), we can learn the refinement step offline instead.
160
161 Crucially, the **API-free signal already exists and is already persisted**:
`yolo_hybrid`
162 Stage 1 is pure YOLO (player tracking ? per-window motion features: peak/mean velocity,
163 active-frame count, track-id count) stored in `candidate_segments.stats`. Gemini is only
164 the Stage-2 refiner. So the rally annotations can **train a classifier to replace
**Gemini**,
165 with no external API and **no new labeling**.
166
167 Three candidate substrates were weighed:
168
169 - **Tune `motion` thresholds** on the annotations ? trivial, fully offline, but a low

```

```

170     ceiling (pixel motion can't separate rally from crowd/pan/replay). Use as a *floor*.
171 - **YOLO features ? trained classifier** ? reuses already-stored, semantically
meaningful
172     player-motion features; medium-high ceiling; moderate effort. *Recommended primary.*
173 - **WASB shuttle-motion ? rally detector** ? highest ceiling (the shuttle defines play),
174     fully offline but heaviest (needs the WSL2 WASB runner, ADR-001); can't train WASB
175     itself (no xy labels), only a rally layer on its output.
176
177     ### Decision
178
179     1. Build an **offline, API-free learned segmenter** as a new registry mode (e.g.
180         `yolo_learned`): label detector windows by overlap with GT rallies, train a
lightweight
181         classifier on the persisted features, emit final segments with **zero API calls**,
and
182         score it with the existing harness against `motion` and a Gemini reference.
183     2. **Choose the substrate from data, not assumption.** A learned refiner can only
sharpen
184         the windows the detector found, so the deciding metric is the detector's **candidate-
stage
185         recall** vs. the annotations: high recall ? build on YOLO features; low recall ?
bring in
186         WASB's shuttle signal to raise the ceiling.
187     3. Keep the Gemini-backed `yolo_hybrid` as an **upper-bound reference**, not a
production
188         dependency.
189
190     ### Consequences
191
192     - The final tool gains a **self-contained, offline, free** rally mode trained on its own
193         curated data ? runnable air-gapped, improvable as more matches are annotated.
194     - The approach is **sport-generic**: the same label?feature?classifier machinery extends
to
195         tennis/cricket once those have annotations.
196     - The full paid 22-video Gemini evaluation is **not** run; spend is limited to a single
197         reference video.
198
199     ### Update (2026-05-26): Phase 3 evidence ? substrate is WASB, not YOLO
200
201     The deciding candidate-recall measurement is in. On shuttleset_8 (64 GT rallies), pure
202     YOLO Stage-1 produced 181 candidate windows with:
203
204     - **Recall @ IoU 0.5 = 0.05**, but recall @ IoU 0.1 = 0.53 and @ IoU 0.01 = 0.72.
205     - **72%** of rallies have *some* candidate overlap, yet the **median best coverage of a
206         rally by any candidate is only ~20%**.
207     - Post-hoc **merging adjacent candidates does not help** (recall stays ~0.05 and
degrades
208         as the merge gap grows ? windows overshoot rather than align).
209
210     Interpretation: YOLO isn't *blind* to rallies, but its windows are **badly misaligned**
?
211     because the **broadcast camera tracks the players**, their on-screen (pixel) velocity
dips
212     *during* rallies and spikes on pans/cuts/replays. Player-pixel-motion is therefore a
poor
213     rally proxy on broadcast footage (it was designed for *static* GoPro recordings). A
214     classifier that only *filters* these windows is capped at ~0.25 recall ? below any
useful
215     bar ? and no simple boundary post-processing recovers it.
216
217     **Decision update:** per this ADR's data-driven rule (low candidate recall ? bring in
the
218     shuttle signal), the offline segmenter's substrate is **WASB shuttle-motion** (ADR-001),
219     not YOLO player-motion. The shuttle's motion/presence is camera-invariant and directly
220     defines active play. The `motion` segmenter is likewise unusable here (0 TP ? moving-

```

```

camera
221     pixel motion is everywhere).
222
223     **Caveats / next:** this is one video; the mechanism (camera tracking) generalizes but
224     should be confirmed on 2?3 more via a *free, local, candidates-only* YOLO pass (no
Gemini).
225     Processing is also slow (~50 min per 1080p video) ? the detection pass likely needs
reduced
226     resolution and/or cached detector outputs to be practical across 22 matches. The
227     substrate-agnostic training-data + classifier layers already built still apply: they
will
228     consume **WASB-derived** windows/features instead of YOLO's.
229
230     ---
231
232     ## ADR-005: Permissive Dependency Stack for the Hosted Monetization Path
233
234     **Date:** 2026-05-30
235     **Status:** Accepted
236
237     ### Context
238
239     The project will be monetized as a **closed-source hosted API** (users upload videos to
a cloud GPU VM and get highlights). Because we never distribute code/binaries, GPL/LGPL
distribution copyleft is not triggered ? but **AGPL §13** (network clause) and **metered-API
terms** are, and **video-codec patent royalties** are a separate concern from software licenses.
A deep-research audit (2026-05-30, 25 adversarially-verified claims against primary sources ?
see `docs/MONETIZATION_AUDIT.md`) identified the blockers and clean alternatives. This ADR also
**resolves the open licensing question in ADR-001/ADR-004** about WASB.
240
241     ### Decision
242
243     1. **Drop `ultralitics`. Both the library and the `yolov8n.pt` weights are
**AGPL-3.0**; §13 makes them a blocker for a closed-source hosted service. Swapping the codebase
while keeping the `.pt` does **not** escape ? the weights are AGPL too. Replace player/motion-
gating detection with a permissive detector: **torchvision Faster R-CNN / RetinaNet (BSD,
default ? zero new deps, person = COCO class 0)**, escalating to **YOLOX** or **RT-DETRv2 (Baidu
repo, Apache-2.0)** if more speed/accuracy is needed. **Ultralytics Enterprise License** is a
paid fallback only (quote-only pricing).
244     2. **Shuttle tracking stays permissive.** **WASB-SBDT and TrackNetV3 are MIT (CLEAR for
commercial use)** ? this resolves the licensing unknown flagged in ADR-001/ADR-004. **MonoTrack
(Adobe Research, noncommercial) and YOLO-NAS weights (Deci, noncommercial) are banned.** Train
our own checkpoints (or confirm per-checkpoint terms), since distributed research
weights/datasets aren't covered by the MIT *code* grants.
245     3. **LLM step ? keep all three strategies open:** (A) eliminate via an offline temporal
segmenter (**ActionFormer, MIT** ? the Phase-4 direction), (B) self-host **Qwen2.5-VL-7B/32B
(Apache-2.0)** or **InternVL2.5 (MIT)**, or (C) keep **Gemini 2.5 Flash on the paid tier**
(required ? the free tier trains on and human-reviews uploaded video). The `google-genai` SDK
itself is Apache-2.0 (clear).
246     4. **Emit royalty-free output.** Standardize highlight output on **AV1 (+ Opus)** to
avoid AVC/HEVC encode-side patent exposure; provision an **Ada-class GPU (L4/L40)** for hardware
AV1 (NVENC), falling back to **SVT-AV1 (CPU, BSD-3-Clause-Clear)** on T4/A10/A100.
247
248     ### Consequences
249
250     - Eliminates the only two hard legal blockers; the rest of the stack (torch, opencv,
fastapi, numpy, lapx, ffmpeg-as-subprocess, google-genai SDK) is already permissive.
251     - Detector swap is contained to `backend/indexer/yolo_hybrid.py` (the `from ultralytics
import YOLO` load + the `model.track(...)` call) plus `config.json` knobs and
`tests/test_yolo_hybrid.py` mocks. Stage-1 feature outputs (velocity/active-frame/track-id
stats) and Stages 2?4 are detector-agnostic and unchanged.
252     - We now own the frame loop + tracking (ultralitics did both internally). Use a
permissive ByteTrack (e.g. `supervision`, MIT, or the MIT ByteTrack repo) on top of `lapx`
(already a BSD dep).
253     - Residual items needing legal sign-off: exact codec-pool royalty thresholds (AVC/HEVC

```

decode of uploads), Ultralytics Enterprise pricing, and per-checkpoint weight licenses ? tracked in `docs/MONETIZATION\_AUDIT.md` §7.

254 - The `yolo\_hybrid` registry key is now a slight misnomer (no YOLO); keep it for back-compat or rename in a follow-up.

255

256 ---

257

258 ## ADR-006: Golden-Set Generation via Vendor Bake-off + a Pluggable Annotation Provider

259

260 **Date:** 2026-05-30

261 **Status:** Accepted (process v1; vendor shortlist pending research)

262

263 ### Context

264

265 The product needs **golden-set ground truth** (hand-verified rally `[start,end)` boundaries) to (a) measure pipeline quality and (b) run **on-demand / surprise regression tests** against the production tool. Two forces shape the design: the hosted-API monetization goal raises a "who views the user's video" concern (ADR-005 / MONETIZATION_AUDIT.md), and the founder is **Bangalore-based** and prefers **local/India vendors**. We already own a deterministic interval scorer (`backend/eval/metrics.py`) and a growing collection of **licensed/owned** match videos.

266

267 Decisions locked with the owner: **licensed/owned video only** (no user uploads to vendors) . **rally `[start,end)` annotation depth** . **tiered turnaround** (fast automated + slow human) . **vendor bake-off** to choose . **Bangalore/India-local preference**.

268

269 ### Decision

270

271 1. **One scorer, three jobs.** A vendor's `[start,end)` output is structurally identical to a prediction, so `metrics.py` grades product-vs-truth, vendor-vs-key, and annotator-vs-annotator (IAA) with no new scoring code.

272 2. **Select vendors by measured quality-per-dollar**, via a bake-off: write a precise rally-definition guideline, build a small internal gold key (5?10 licensed clips), send the same clips to 2?3 vendors (favoring Bangalore/India), and grade every submission with our own harness. The numbers are the decision.

273 3. **Pluggable `AnnotationProvider` registry** mirroring the existing registry pattern: `FileProvider` (today's manual/ShuttleSet flow), `HumanVendorProvider` (slow tier ? authoritative truth), `AutomatedProvider` (fast tier ? independent model oracle).

274 4. **Regression = existing harness + one new component.** `regress(video)` calls a provider for ground truth, runs the production pipeline, and scores with the unchanged `metrics.py` against a per-video `baseline.json`.

275 5. **Privacy by construction.** Golden sets use only licensed/owned footage; all third-party video egress flows through the single provider boundary where DPA / no-reuse / delete-on-delivery / access-logging controls live.

276

277 ### Consequences

278

279 - Eliminates the "human views user video" concern for golden-set/regression work, because user uploads never enter the pipeline.

280 - **The oracle problem is a first-class caveat:** the fast-tier `AutomatedProvider` must be a **different model lineage** than production (else shared blind spots make the test falsely green); fast-tier alarms escalate to the slow human tier before blocking a release.

281 - New docs: `docs/GOLDEN\_SET\_VENDURING.md` (the full process v1) and `docs/VIDEO\_RECORDING\_GUIDELINES.md` (a tracked draft: capture-quality thresholds to be derived empirically from precision/recall, since input quality bounds output quality ? cf. ADR-004's broadcast-camera finding).

282 - The vendor shortlist itself is **pending a primary-source research pass** (favoring India/Bangalore) and is intentionally left blank until verified ? no un-sourced vendor claims.

283 - **Honest limitation:** a licensed/owned corpus may not fully represent real user capture, so regression greens are strong evidence, not guarantees ? the recording-guidelines work aims to narrow that gap.

284

285 ### Update (2026-06-02): shortlist researched; Roora selected for the initial pilot

286

287 - The **vendor shortlist** is filled in (GOLDEN_SET_VENDURING.md §6, primary-source pass

2026-05-30).

288 - The founder selected **Roora ML Pvt Ltd** (HSR Layout, Bengaluru) for the **initial paid pilot**, diverging from the doc's iMerit/Taskmonk default toward a Bangalore-local, startup-friendly shop. Roora's existence, image/video/temporal capability, and location are verified (rooragr.com); **pilot quality is still to be measured** ? run as a **single-vendor pilot first** (the pilot **is** the calibration), not a multi-vendor bake-off.

289 - **Step 0** ? the annotation guideline ? is authored (the highest-leverage artifact): collector repo `docs/annotation/` ? **ROORA_BRIEF.md** (rally CSV schema), **ANNOTATION_GUIDE.md** (illustrated guide), plus intake-manifest and NDA templates.

290 - **Pilot scope is 3 sports** (badminton, pickleball, table tennis); the collector's **import-local** ingestion for all three is implemented (collector ADR-001).

291 - **Still pending:** the internal **gold key** (5?10 expert-labeled clips) and the vendor-dependent **GS-3** **HumanVendorProvider** ? GS-1/GS-2/GS-4 (FileProvider, regression runner, automated-oracle scaffold) have already landed (see **GOLDEN_SET_IMPLEMENTATION.md**).

498. user (2026-06-07T01:19:21.771Z)

1 # Video Recording Guidelines (DRAFT ? thresholds pending empirical data)

2
3 **Status:** ? Draft / placeholder . **Date:** 2026-05-30
4 **Why this exists:** highlight quality is bounded by **input** quality. To get reliably good auto-generated highlights, the source video must be recorded a certain way (camera height, court position, resolution, frame rate, stability, framing). We want to (1) **derive** the minimum acceptable capture spec **empirically** from the precision/recall of the solutions we build, and (2) **publish user-facing best practices** so a user knows how to record footage that the product can index well.

5
6 > **This is a tracked thought, not a finished standard.** The exact numeric thresholds below are **placeholders** to be replaced with values measured against our golden set. See "How we'll set the real numbers" (§3). Captured now (per the team's working agreement) so it isn't lost; to be revisited.

7 >
8 > **Update (2026-06-02):** the **frame-rate** and **camera-geometry** rows now carry **literature-backed starting values** (cited inline). They remain **starting points** to confirm empirically per §3. The golden-set **corpus** diversity spec (what footage to collect, not just how users should record) is now in GOLDEN_SET_PHASE1_VIDEOS.md.

9
10 ---

11
12 **## 1. Why input capture matters (grounded in what we already know)**

13
14 ADR-004 found a concrete, capture-dependent failure mode: on **broadcast** footage the camera **tracks the players**, so player pixel-motion dips during rallies and spikes on pans/replays ? making player-motion a poor rally proxy. The lesson generalizes: **the pipeline's accuracy is conditional on how the video was shot.** A **static, full-court** camera (typical of a fixed tripod recording) behaves very differently from broadcast ? and is likely much friendlier to both the motion/detector stages and the shuttle-tracking substrate (WASB/TrackNet, ADR-001).

15
16 So capture guidance isn't cosmetic ? it directly moves precision/recall.

17
18 ---

19
20 **## 2. The dimensions that likely matter (hypotheses to test)**

21
22 | Dimension | Why it plausibly affects P/R | Placeholder guidance (UNVERIFIED) |
23 |---|---|---|
24 | **Resolution** | Shuttle is tiny & fast; too few pixels ? detector misses it | ?
1080p preferred; **720p** likely floor; 2K/4K may help shuttle tracking but ? compute/cost |
25 | **Frame rate** | Motion blur; boundary precision; fast-ball detection | ? **30 fps**
badminton/pickleball; ?? 60 fps table tennis ? 30 fps collapses fast-ball detection (**22.5%**
? **93.2%** at 60 fps; 120 ? 60, [Nature Sci
Rep](https://www.nature.com/articles/s41598-023-42966-6)) |

26 | **Camera position** | Static full-court view avoids the broadcast camera-tracking trap

```

(ADR-004) | **Fixed tripod**, elevated, behind/above one baseline, whole court in frame |
27 | **Camera height & angle** | Occlusion of players/shuttle; court keystoneing | **3?5 m**
elevated (~4.5 m), **~30° down-tilt**, behind one baseline, whole court + net headroom
([badminton-CV setup](https://pmc.ncbi.nlm.nih.gov/articles/PMC10747833/)) |
28 | **Framing / margins** | Cropping the court or players breaks detection & relevance
check | Entire court + a margin; players never leave frame |
29 | **Stability** | Handheld jitter inflates motion signals | Tripod / fixed mount; no
panning or zoom during play |
30 | **Lighting / exposure** | Blur & contrast affect detection and the existing
blur/relevance validators | Even indoor lighting; avoid backlight/glare; minimize motion blur |
31 | **Court contrast / background** | Relevance check uses court color; busy crowds add
false motion | Clear court markings; minimal moving background where possible |
32 | **Codec / container** | Pipeline already validates MP4 + decodes H.264/HEVC | MP4
(H.264/HEVC) as today; align with MONETIZATION_AUDIT.md codec notes |
33
34     These map onto checks that **already exist** in `backend/validators/` (resolution, fps,
blur, scene-cut, court relevance) ? so several can be enforced/measured programmatically rather
than only advised.
35
36     ---
37
38     ## 3. How we'll set the REAL numbers (empirical plan)
39
40     Replace every placeholder above with a value derived from data, using the golden-set
harness:
41
42     1. Take golden-set clips (GOLDEN_SET_VENDORING.md) spanning a **range** of each
dimension ? e.g. the same match re-encoded at 480p/720p/1080p/4K, or clips at different camera
heights.
43
44     2. Run the production pipeline; score with `backend/eval/metrics.py`.
45
46     3. Plot **precision/recall vs. each dimension** ? find the knee where quality collapses.
47
48     4. Set the **published minimum** at (knee + safety margin); set a **"recommended"*** tier
above it.
49
50     5. Re-derive when the pipeline changes materially (new detector/segmenter shifts the
knees).
51
52     This turns "record in 1080p" from an assertion into a measured threshold ? and lets us
tell users *why*.
53
54     ---
55
56     ## 4. Two surfaces for the output
57
58
59     1. **User-facing best-practices guide** ? short, friendly, illustrated: "Put the camera
here, this high, record at ?X, keep it still." The goal is that a user can record once and get
great results.
60
61     2. **Programmatic pre-flight check** ? extend `backend/validators/` to *reject or warn*
on out-of-spec uploads at ingest (resolution/fps/blur/framing), so the product fails fast with
actionable feedback instead of producing poor highlights silently.
62
63     ---
64
65     ## 5. Open questions
66
67     1. Which dimension dominates ? resolution, camera staticness, or height? (Run the
ablations in §3 to rank them.)
68
69     2. Do we **enforce** minimums (reject uploads) or only **warn**? Likely warn first,
enforce once thresholds are trustworthy.
70
71     3. Single fixed-camera spec, or several supported "recording profiles" (e.g. baseline-
elevated vs. side-elevated)?
72
73     4. How does the owned/licensed golden corpus need to grow to *cover* the capture
conditions real users will actually use? (Feeds GOLDEN_SET_VENDORING.md §8.)
74
75

```

The decision docs are clear ? latest is ADR-006, so audio becomes **ADR-007**, and the recording-guidelines doc already has a dimensions table I'll extend with an audio row. Let me mark this phase and write the detailed audio plan first.

500. user (2026-06-07T01:20:10.818Z)

Chapter marked: "Audio plan + decision docs". Continue your current work.

501. assistant (2026-06-07T01:20:51.319Z)

Audio-based rally detection ? detailed plan

Status: Accepted direction (ADR-007) · experiments gated on golden eval labels · **Date:** 2026-06-07
Decision in one line: add a fully-local **audio "thwack"** hit-detection cue, fused with the WASB shuttle trajectory, as the next rally-detection lever ? because it directly attacks our recall bottleneck using an input we currently throw away. Pose/stance detection is the parked #2 (see ADR-007 / [research](RALLY_DETECTION_RESEARCH.md)).

1. Why audio (grounded in the research)

- **#1 cheap local lever** in the verified survey (``docs/RALLY_DETECTION_RESEARCH.md``). Audio+visual **fusion** lifts rally RECALL ? tennis HMM: 83% fused vs 54% visual-only / 63% audio-only at ~unchanged precision ? and recall is exactly where WASB-derived windows fail us (IoU-0.5 candidate recall ceilinged at ~0.43 on TestLargeVideo).
- **Fully local, permissive, CPU-light** (classical MFCC/energy methods; no restrictive weights) ? keeps the privacy lever and adds ~zero marginal cost.
- **Uses an input we currently ignore.** Our GoPro clips already carry audio.

2. What we detect, and the rally model

- **Hit event** = racket?shuttle contact ("thwack"), a short broadband transient.
- **Rally** = a temporally-clustered run of hits with rhythmic cadence (a shot roughly every ~0.4?2 s, alternating ends). **Dead time** = no/sparse hits. A **single isolated hit** = the between-point service feed/toss ? i.e. exactly the false-fire pattern we've been fighting. So hit ***clusters***, not single hits, define rallies.

3. The GoPro-audio reality (honest, and the key risk)

All clips provided so far have audio (GoPro records it by default). BUT: a shuttle "thwack" is **much quieter**

than a tennis/table-tennis impact (lighter projectile), so the **SNR transfer** is the dominant open risk ? the

research's audio numbers come from louder sports. Gym reverb, wind, and crowd add noise.

Mitigations:

1. **E1 (below)** is an explicit GO/NO-GO probe on the real GoPro audio before we build anything heavy.
2. Make **"record with audio enabled, mic unobstructed"** a capture requirement (added to ``docs/VIDEO_RECORDING_GUIDELINES.md``).

4. Architecture (all local, CPU-light)

- **Stage 0 ? Extract:** ``ffmpeg`` ? mono WAV (~16?22 kHz; keep HF ? clicks are broadband). Cached per video, keyed like the frame/trajectory caches.
- **Stage 1 ? Onset/peak candidates (NO training):** band-emphasis/high-pass ? short-time energy + spectral

flux ? adaptive (EMA/median) threshold ? peak-pick ? `(timestamp, strength)` candidate impacts. (Research E1.)

- **Stage 2 ? Hit confidence / FP suppression:** a likelihood-ratio confidence (research: raw peaks ~41?50 F ? ~68?77 F) and optionally a tiny MFCC-window classifier (GMM/logreg, hit-vs-not), bootstrapped from the user's golden rally spans (hits inside rallies = positives). (Research E2.)
- **Stage 3 ? Hits ? rally structure:** cluster impacts by inter-hit gap; a cluster with ?K hits and plausible cadence = a rally; **START ? first hit (the serve), END ? last hit + a short tail**; drop isolated single hits (the feed).
- **Stage 4 ? Fuse with the WASB trajectory:**
 - **Recall recovery (the main win):** propose a candidate rally wherever there's a dense hit-cluster but WASB proposed nothing.
 - **Precision / features:** add per-candidate audio features ? `hit\_count`, `hit\_rate`, inter-hit-interval mean/std (cadence regularity), `time\_since\_last\_hit`, end-of-window energy ? to the existing `distill\_local` student (Research E3).
 - **Joint rule:** a rally needs shuttle-motion **and** a hit-cluster (precision), OR an audio cluster recovers a WASB miss (recall).
- **Stage 5 ? Eval:** vs **golden labels** (the rater CSVs from the VLC annotator) at IoU 0.5, leave-one-video-out; report recall lift + precision vs the WASB-only baseline and the trajectory-only distilled model.

5. Experiments (sequenced ? E1 is the gate)

#	Experiment	Needs	Decides
E1	Extract audio ? energy-peak hits ? overlay hit-density on WASB windows and golden labels audio + ?1 golden-rated video GO/NO-GO : do hit-clusters align with real rallies + recover WASB-missed ones on <i>real GoPro</i> audio?		
E2	Add likelihood-ratio / MFCC confidence to suppress false peaks E1 + a few labeled hits F-score lift of the hit stream		
E3	Add audio features to `distill_local`; re-eval IoU-0.5 LOVO E1/E2 + ?2 golden videos does fused beat WASB-only + trajectory-only distilled?		
E4	Use first/last hit to tighten rally start/end E1 boundary-IoU improvement		

6. Code & dependencies

- New module `backend/audio/hit\_detector.py` (extract + onset/peak + confidence). Pure DSP helpers unit-tested
 - on **synthetic click audio** (no fixtures); ffmpeg via subprocess (already a dep).
- Reuse: feed audio features into `backend/eval/distill\_local.py` (pluggable `feature\_fn`); score with the existing `metrics.py` / golden loaders.
- **Deps:** prefer **numpy + scipy (BSD)** for filtering/STFT (numpy already present; scipy is permissive and light). Avoid heavy/AGPL audio stacks. Any later small CNN = trained in-house (no restrictive weights).
- **Licensing:** all permissive ? no new model weights for Stage 1. Consistent with ADR-005.

7. Risks & mitigations

- **Shuttle SNR (top risk):** E1 is the empirical gate; if NO-GO, audio is deferred, not forced.
- **No crowd applause** in amateur single-camera clips (a cue the literature leans on for end-of-point) ? rely
 - on **hit-cadence cessation**, not applause.
- **Mic occlusion / wind** ? recording guideline (audio on, unobstructed, avoid aggressive wind-suppression).
- **A/V sync:** audio and frames share the same file timeline ? no sync work needed.

8. Gating & sequencing

- All measurement is **gated on golden labels** (user rating via the VLC annotator ? ``import-local`` / the `in-repo`--labels` loaders`). So: rate a few videos ? **E1 go/no-go** ? E2/E3.
- Roadmap order: **AUDIO (now)** ? `*[a TBD owner hunch ? slot reserved]*` ? **POSE/STANCE (#2, parked; expected substantially harder)**.

9. Success criteria

- **E1:** audio hit-clusters recover a meaningful share of WASB-missed golden rallies on real GoPro audio (recall lift), with hit-clusters aligning to true rallies. Pass ? proceed; fail ? defer audio, revisit mic/setup.
- **E3:** the fused model's held-out (LOVO) F1 beats both the WASB-only baseline and the trajectory-only distilled student.

502. user (2026-06-07T01:20:51.338Z)

File created successfully at: C:\Users\avidu\Projects\badminton-highlight-indexer\docs\AUDIO_RALLY_DETECTION_PLAN.md (file state is current in your context ? no need to Read it back)

503. assistant (2026-06-07T01:21:10.473Z)

ADR-007 ? appending the decision to ``docs/DECISIONS.md``:

504. user (2026-06-07T01:21:19.580Z)

The file C:\Users\avidu\Projects\badminton-highlight-indexer\docs\DECISIONS.md has been updated successfully. (file state is current in your context ? no need to Read it back)

505. assistant (2026-06-07T01:21:32.686Z)

Now the recording guideline ? adding audio as a first-class capture requirement (ADR-007):

506. user (2026-06-07T01:21:37.256Z)

The file C:\Users\avidu\Projects\badminton-highlight-indexer\docs\VIDEO_RECORDING_GUIDELINES.md has been updated successfully. (file state is current in your context ? no need to Read it back)

507. user (2026-06-07T01:21:52.151Z)

The file C:\Users\avidu\Projects\badminton-highlight-indexer\docs\VIDEO_RECORDING_GUIDELINES.md has been updated successfully. (file state is current in your context ? no need to Read it back)

508. assistant (2026-06-07T01:22:04.901Z)

Docs done. Let me check in everything uncommitted ? the research, the ADR + plan, the recording requirement, and the VLC annotator ? as one PR.

509. user (2026-06-07T01:22:08.469Z)

Two stray files appeared (`scratch/rally\_annotator\_verified.lua`, `scripts/vlc/`) ? likely a workflow agent wrote them despite being asked to return code. Let me inspect before deciding (I don't want to commit duplicates or delete something useful).

511. user (2026-06-07T01:22:28.015Z)

515. assistant (2026-06-07T01:23:21.339Z)

PR #32 is up. Let me log the decision in memory, then walk you through the plan.

516. user (2026-06-07T01:23:27.282Z)

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md has been updated successfully. (file state is current in your context ? no need to Read it back)

517. assistant (2026-06-07T01:23:53.699Z)

? The audio plan ? committed & documented (PR #32)

Everything's checked in: ****ADR-007**** (the decision), ****`docs/AUDIO\_RALLY\_DETECTION\_PLAN.md`**** (the detailed plan), the ****research report****, the *****"audio always on" recording requirement****, and the ****VLC annotator****. Here's the plan in plain terms.

****Core idea:**** a rally is a **cluster of hits with rhythmic cadence**; dead time has no hits; a ****single isolated "thwack" = the between-point service feed**** (exactly our false-fire). So the audio doesn't replace WASB ? it ****fuses**** with it, and its biggest job is ****recall****: propose a rally wherever there's a hit-cluster but WASB found nothing (the gap that ceilinged us at ~0.43).

****Pipeline (all local, CPU-light, permissive ? numpy+scipy):****

1. ``ffmpeg`` ? mono WAV.
2. Onset/energy-peak detection (no training) ? candidate impact timestamps.
3. Confidence/false-positive suppression (likelihood-ratio + a tiny MFCC classifier) ? the research showed raw peaks are weak (~41?50 F) but post-processing lifts them to ~68?77.
4. Cluster hits ? rally: ****START ? first hit (serve), END ? last hit + tail****; drop lone hits.
5. Fuse with WASB: recall-recovery + audio features (``hit_count``, ``hit_rate``, cadence regularity, ``time_since_last_hit``) into the distilled student.

****On your GoPro-audio doubt ? you're right to flag it, and it's the #1 risk.**** A shuttle "thwack" is **much quieter** than a tennis/table-tennis impact, so SNR transfer is genuinely uncertain. That's why ****E1 is an explicit GO/NO-GO probe on your real GoPro audio**** before we build anything heavy: extract audio ? peak-detect ? overlay hit-density on a video you've rated ? does it (a) align with real rallies and (b) recover the ones WASB misses? If E1 fails, we defer audio honestly rather than sink effort. Making *****"record with audio on, mic unobstructed"***** a camera-setup requirement (now in the guidelines) is the right move ? it's a cheap insurance that protects the cue, and yes, please add it to your camera-setup doc.

****Sequencing locked:**** ****audio now ? [your other hunch ? slot reserved] ? pose/stance (#2, parked, the harder one).****

****What unblocks E1:**** one or two videos rated with the ****VLC annotator**** (so I have golden rally boundaries to score against). The moment you've rated a clip, I run E1 and we get a real answer on shuttle-audio efficacy.

When you're ready to share that hunch, I'm all ears ? and whenever a rated CSV exists, ping me and I'll kick off E1. Open PR to merge: ****#32****.

518. user (2026-06-07T01:23:56.511Z)

BTW if the vlc plugin can be checked in as a separate repository, that would be great. Tell me if I should make a directory or do something on github, but I would like to release this code of badminton for others to use. Additionally I would like to iterate so that we can ensure it works for all racquet net separated sports seamlessly and not just badminton, so better to isolate it in a separate repo rather than going ballistic here.

519. assistant (2026-06-07T01:25:23.165Z)

Smart call ? a standalone, sport-agnostic, MIT-licensed repo is exactly right for an open-source release, and it keeps the indexer focused. I'll handle the whole thing: generalize the plugin

for net-separated racquet sports, create the repo, push it, and remove it from the indexer (PR #32 becomes docs-only, with references repointed).

Two quick decisions are genuinely yours before I create a public repo:

520. user (2026-06-07T01:25:37.443Z)

Your questions have been answered: "What should the public GitHub repo be named? (net-separated racquet sports rally annotator)"="rally-annotator", "Repository visibility?"="Public (Recommended)". You can now continue with these answers in mind.

521. assistant (2026-06-07T01:25:55.885Z)

`rally-annotator`, public. Let me read the verified plugin so I generalize it accurately (add a sport selector + generic framing for all net-separated racquet sports).

522. user (2026-06-07T01:25:56.181Z)

```
1      --[[ rally_annotator.lua  --  VLC Lua EXTENSION (v1.1)
2
3      Mark badminton rally START / END + a point-stop reason while watching, and
4      append one CSV row per rally that this repo's golden-set loaders (and the
5      separate sports-data-collector `import-local` command) ingest directly.
6
7      Output CSV columns (decimal SECONDS):
8          rally_number,start_time,end_time,ending_reason
9
10     WHY a button-dialog (not an auto-pause hook):
11         VLC 3.x can expose pause via the {"playing-listener"} capability
12         (status_changed/playing_changed), but that callback is flaky on macOS
13         (VLC #22778) and the input/meta listeners are broken in VLC 4.0 (#27558).
14         A persistent dialog whose button callbacks SNAPSHOT the current playback
15         time is portable, precise, and lets the rater pause/scrub freely before
16         committing a mark. So we use NO listener capabilities.
17
18     UNITS: in VLC 3.x, vlc.var.get(input,"time") is in MICROSECONDS -> /1e6.
19
20     Install (Windows): copy this file to
21         %APPDATA%\vlc\lua\extensions\rally_annotator.lua
22     then VLC > Tools > Plugins and extensions > Reload extensions (or restart),
23     then enable it from the View menu.
24 ]]

523. assistant (2026-06-07T01:27:14.002Z)

Got the verified plugin. Now I'll build the standalone `rally-annotator` repo with a generalized (multi-sport) plugin, MIT license, README, and CSV-format docs. Writing the generalized plugin first (adds a Sport selector + `sport` column; generic framing):

524. assistant (2026-06-07T01:27:14.300Z)

```
--[[ rally_annotator.lua  --  VLC Lua EXTENSION (v1.2)
```

```
Rally Annotator for NET-SEPARATED RACQUET SPORTS
(badminton · tennis · table tennis · pickleball · padel)
```

While watching a match in VLC, mark each rally's START / END and a point-stop reason, and append one CSV row per rally. Pause/scrub freely, then click ? the callback snapshots the exact playback time. Output is a plain CSV that ingests directly into common rally-segmentation tooling.

```
Output CSV columns (times in decimal SECONDS):
    rally_number,start_time,end_time,ending_reason,sport
```

WHY a button-dialog (not an auto-pause hook):

```
VLC 3.x can expose pause via the {"playing-listener"} capability
(status_changed/playing_changed), but that callback is flaky on macOS
(VLC #22778) and the input/meta listeners are broken in VLC 4.0 (#27558).
A persistent dialog whose button callbacks SNAPSHOT the current playback
time is portable, precise, and lets the rater pause/scrub before committing.
So we declare NO listener capabilities.
```

UNITS: in VLC 3.x, `vlc.var.get(input,"time")` is in MICROSECONDS -> /1e6.

Install (Windows): copy this file to

```
%APPDATA%\vlc\lua\extensions\rally_annotator.lua
```

```
macOS: ~/Library/Application Support/org.videolan.vlc/lua/extensions/
```

```
Linux: ~/.local/share/vlc/lua/extensions/
```

then VLC > Tools > Plugins and extensions > Reload extensions (or restart),
then enable it from the View menu.

MIT licensed. <https://github.com/avidullu/rally-annotator>

```

Now the repo scaffolding ? README, MIT license, CSV-format doc, changelog, gitignore:

527. assistant (2026-06-07T01:27:42.807Z)

Rally Annotator

A tiny **VLC plugin** to hand-label rally **start/end + point-stop reason** while you watch a match,
for **net-separated racquet sports** ? badminton, tennis, table tennis, pickleball, padel.

You watch the video in VLC, pause/scrub freely, and click **Mark START** / **Mark END** (with a reason). It writes one CSV row per rally ? clean ground-truth labels for training/evaluating rally (point) segmentation models, or just for cutting highlights.

```
...
rally_number,start_time,end_time,ending_reason,sport
1,8.800,11.500,winner,badminton
2,24.389,46.589,unforced_error,badminton
...
```

Times are **decimal seconds**. See docs/CSV_FORMAT.md.

Why

Labeling rally boundaries is the slow, expensive prerequisite for any rally-detection model. Most tools make you transcribe timestamps by hand. This lets a rater do it **inside the player they already use**, pausing to the exact frame before each mark ? turning "watch a match" into "produce golden labels."

Install

1. Copy `vlc/rally\_annotator.lua` into your VLC Lua **extensions** folder:
 - **Windows**: `%APPDATA%\vlc\lua\extensions\``
 - **macOS**: `~/Library/Application Support/org.videolan.vlc/lua/extensions/``
 - **Linux**: `~/local/share/vlc/lua/extensions/``(create the `extensions` folder if it doesn't exist)
2. In VLC: **Tools ? Plugins and extensions ? Reload extensions** (or just restart VLC).
3. Enable it from the **View** menu ? **Rally Annotator**. A small dialog opens and stays open while you watch.

Requires **VLC 3.0.x**. (VLC 4.0 changed the Lua input/listener API; targeting 3.x for now.)

Use

1. Pick the **Sport** in the dropdown.
2. Play the match. When a rally begins, click **Mark START** (snapshots the current time ? pause/scrub first for frame accuracy).
3. Choose the **Ending reason** (winner / forced_error / unforced_error / service_fault / let / other).
4. When the rally ends, click **Mark END** ? one row is appended immediately.
5. **Undo last** removes an uncommitted START or the last written row (one level).
6. The status panel shows the current time, whether a START is armed, rallies written, and the **output CSV path**.

Output: `<video-stem>.rallies.csv`` next to the video (falls back to your home dir if the path can't be resolved). Re-opening the extension **continues** rally numbering from the existing file ? no

duplicate IDs,
no overwrite.

Sports & taxonomy

Net-separated racquet sports share a forced/unforced-error point-stop taxonomy, so one tool covers them all:

```
| Sport | Notes |  
|---|---|  
| badminton | the reference sport |  
| tennis | service_fault = fault/double-fault; let supported |  
| table_tennis | let (net serve) supported; fast cadence |  
| pickleball | service_fault for faults; treat "let" per local rules |  
| padel | net-separated; rally boundaries as in tennis |
```

`ending\_reason` ? `{winner, forced\_error, unforced\_error, service\_fault, let, other}` ? a shared vocabulary

across these sports. Keep to these values for clean downstream aggregation.

Roadmap

- [] Validate v1.2 multi-sport build live in VLC across all five sports.
- [] Optional per-sport reason presets / hotkeys.
- [] Alternative front-ends for power users / remote raters: a `python-vlc` + Tk/Qt app with global keyboard shortcuts (S/E/1?6/U), and a zero-install HTML5 `` page that exports the same CSV.
- [] Optional extra columns (e.g. `shots\_count`, server/receiver) behind a toggle.

Contributing

Issues and PRs welcome ? especially live test reports per sport/OS and small UX fixes. The plugin is a single self-contained Lua file (`vlc/rally\_annotator.lua`) using only documented VLC 3.x Lua APIs.

Output CSV format

One row per rally. Header is written once when the file is created.

```
...
```

```
rally_number,start_time,end_time,ending_reason,sport
```

```
1,8.800,11.500,winner,badminton
```

```
2,24.389,46.589,unforced_error,badminton
```

```
3,49.183,54.683,let,badminton
```

```
...
```

```
| Column | Type | Notes |
```

```
|---|---|---
```

```
| `rally_number` | int | 1-based, monotonic; continues across re-opening the same CSV |
```

```
| `start_time` | float | rally start, decimal seconds from the video start |
```

```
| `end_time` | float | rally end, decimal seconds (always > start_time) |
```

```
| `ending_reason` | enum | `winner` / `forced_error` / `unforced_error` / `service_fault` /  
`let` / `other` |
```

```
| `sport` | enum | `badminton` / `tennis` / `table_tennis` / `pickleball` / `padel` |
```

Notes:

- **Decimal seconds**, not `mm:ss` ? downstream loaders parse floats.
- Rows are appended live; **Undo last** truncates the last row (one level).
- Consumers should read by **column name** (the header is stable but column *order* may evolve; extra columns may be added later). Most CSV `DictReader`-style loaders already tolerate extra columns.

Ingesting the labels

This CSV is intentionally compatible with common rally-segmentation tooling that reads ``rally_number,start_time,end_time`` by header name and drops rows where ``end` <= `start``:

```
```bash
```

**Generic: any tool that takes a labels CSV of start/end seconds.**

**Example ? score a detector against these labels, or slice clips by them (badminton-highlight-indexer loaders read `--labels <this.csv>` directly):**

```
python -m backend.eval.calibrate_wasb --trajectory traj.csv --labels match.rallies.csv --fps
```

```
59.94 --frame-width 1920
```

```
python -m backend.tools.rally_slicer --video match.mp4 --labels match.rallies.csv --rallies all
```

**Example ? register as curated golden data in sports-data-collector:**

```
python -m src.cli.curate import-local --sport badminton --video-path match.mp4 --annotations-
path match.rallies.csv
```

```
...
```

The ``sport`` column is self-documenting; tools that take a `--sport`` flag can ignore it.

## Changelog

### v1.2 ? 2026-06-07

- Generalized from badminton-only to **net-separated racquet sports** (badminton, tennis, table tennis, pickleball, padel) via a new **Sport** dropdown and a ``sport`` CSV column.
- Generic naming/branding; MIT-licensed standalone release.

### v1.1 (badminton-only, pre-release; from badminton-highlight-indexer)

- Button-driven dialog (not an auto-pause hook ? that VLC callback is flaky on macOS / broken in VLC 4.0).
- Snapshots ``vlc.var.get(input,"time")/1e6`` (microseconds ? seconds).
- Continues rally numbering across re-enable (no duplicate ``rally_number``); one-level Undo; HTML status panel.
- Writes ``rally_number,start_time,end_time,ending_reason`` next to the video.

> Note: v1.2 changes the multi-sport path and is **pending a live VLC smoke test** across all five sports.

#### 539. assistant (2026-06-07T01:28:54.192Z)

Need to set the git identity for the fresh repo (the indexer repo has a local one). Let me mirror the indexer's identity so commits are consistent, then commit.

#### 540. user (2026-06-07T01:28:58.660Z)

indexer identity: Avi Dullu <avi.dullu@gmail.com>

=== committed ===

fa2a55b Initial release: VLC rally annotator for net-separated racquet sports

#### 541. assistant (2026-06-07T01:29:04.212Z)

Committed. Creating the public GitHub repo and pushing:

#### 542. user (2026-06-07T01:29:11.196Z)

<https://github.com/avidullu/rally-annotator>

branch 'main' set up to track 'origin/main'.

To <https://github.com/avidullu/rally-annotator.git>

```
* [new branch] HEAD -> main
```

=== verify ===

origin <https://github.com/avidullu/rally-annotator.git> (fetch)

```
{"defaultBranchRef":{"name":"main"},"url":"https://github.com/avidullu/rally-annotator","visibility":"PUBLIC"}
```

#### 543. assistant (2026-06-07T01:29:34.389Z)

? \*\*Public repo live: <https://github.com/avidullu/rally-annotator>\*\* (MIT, multi-sport, default branch `main`). Now let me remove the annotator from the indexer PR #32 and repoint the doc references to the new repo.

#### 544. user (2026-06-07T01:29:36.615Z)

Switched to branch 'docs/audio-plan-adr007'

=== refs to repoint ===

docs/DECISIONS.md:335: (`tools/vlc\_rally\_annotator/`) now lets the owner self-produce, and the collector `import-local` ingests.

removed tools/vlc\_rally\_annotator from indexer

**545. user (2026-06-07T01:29:48.090Z)**

```
332 - New `backend/audio/` module (extraction + onset/peak + confidence), feeding
`distill_local` and scored by the
333 existing `metrics.py` / golden loaders. Adds a light scipy dependency.
334 - All audio measurement is blocked on golden eval labels ? which the new VLC rally-
annotator
335 (`tools/vlc_rally_annotator/`) now lets the owner self-produce, and the collector
`import-local` ingests.
336 - Sport-generic: tennis/table-tennis hits are louder, so the cue should transfer at
least as well there.
337 - Honest risk: if E1 shows shuttle SNR is too poor on real amateur audio, audio is
deferred ? this ADR
338 commits to the experiment and direction, not to a guaranteed win.
339
```

**546. assistant (2026-06-07T01:29:47.333Z)**

Only ADR-007 references it. Let me repoint it to the standalone repo.

**547. user (2026-06-07T01:29:53.946Z)**

The file C:\Users\avidu\Projects\badminton-highlight-indexer\docs\DECISIONS.md has been updated successfully. (file state is current in your context ? no need to Read it back)

Updating memory to reflect the annotator's new home:

**553. user (2026-06-07T01:31:16.533Z)**

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md has been updated successfully. (file state is current in your context ? no need to Read it back)

#### 554. assistant (2026-06-07T01:31:37.796Z)

All done ? you didn't need to do anything on GitHub; I created and pushed it for you.

#### ??? Standalone repo shipped: <https://github.com/avidullu/rally-annotator>

**\*\*Public · MIT · multi-sport.\*\*** It's now its own project, cleanly isolated from the indexer so you can iterate and release it freely.

**\*\*What I did:\*\***

- **\*\*Created + pushed the public repo\*\*** (`gh repo create`), default branch `main`, with a proper open-source layout: `vlc/rally\_annotator.lua`, `README.md`, `LICENSE` (MIT © Avi Dullu), `docs/CSV\_FORMAT.md`, `CHANGELOG.md`, `.gitignore`. Local clone at `C:\Users\avidu\Projects\rally-annotator\`.
- **\*\*Generalized it to net-separated racquet sports\*\*** (badminton / tennis / table tennis / pickleball / padel) ? v1.2 adds a **\*\*Sport dropdown\*\*** and a `sport` column; the forced/unforced ending-reason taxonomy is already shared across these sports. CSV is now `rally\_number,start\_time,end\_time,ending\_reason,sport`.
- **\*\*Installed v1.2 into your VLC\*\*** (replaced the badminton-only v1.1 at `%APPDATA%\vlc\lua\extensions\`).
- **\*\*Removed it from the indexer\*\*** ? PR #32 is now **\*\*docs-only\*\*** (research + audio plan + ADR-007), with the ADR reference repointed to the new repo.

**\*\*One honest caveat:\*\*** v1.2 is the **\*multi-sport\*** build, which I changed since the last verified version (added the Sport dropdown) ? and I still can't click through VLC myself. So the first launch is your smoke test across the sports; if a widget misbehaves, paste the error and I'll fix v1.2.1.

**\*\*Iteration loop going forward:\*\*** edit in `Projects\rally-annotator\vlc\rally\_annotator.lua` ? I copy to `%APPDATA%` for you to test ? commit/push to the repo. The README has a roadmap (live-test all 5 sports, per-sport hotkeys, and optional `python-vlc`/HTML5 front-ends for power users / remote raters like Roora).

**\*\*To merge:\*\*** PR #32 (docs-only) in the indexer, whenever you like. The new repo is already live and standalone.

Want me to add anything to the repo before you share it ? a short GIF/screenshot placeholder in the README, GitHub topics (badminton, tennis, vlc, sports-analytics, annotation), or a CONTRIBUTING.md?

#### 555. user (2026-06-07T01:45:37.103Z)

For the audio plumbing, I am trying to understand that whether we will integrate it in a way that we get audio as a separate signal for the entire video and then in code we try to fuse with WASB and make corrections to WASB models output, or we are going to feed the audio to WASB in a way that it uses audio signals to further refine its metrics which help us detect rallies better?

#### 556. assistant (2026-06-07T01:46:37.180Z)

Great question ? it's the key architectural fork, and the answer is firmly **\*\*Option A: audio is a separate whole-video signal, fused in \*our\* rally layer ? we do not feed audio into WASB.\*\*** Here's the why, because it's grounded in what WASB actually is.

**\*\*WASB is a vision-only shuttle \*detector\*, not a rally detector.\*\*** It's a frozen, pretrained CNN (HRNet) that takes **\*image frames\*** ? per-frame shuttle `(x, y, visibility)`. Two consequences:

- It has **\*\*no audio pathway\*\***. Making it ingest audio means adding an audio encoder + fusion layers and **\*\*retraining the whole network\*\*** ? which (a) needs **\*\*per-frame shuttle-coordinate labels paired with audio\*\***, which we don't have (we only have rally `[start,end]` labels), and

(b) forks the clean MIT model we rely on.

- **It doesn't decide rallies at all.** Rally detection is **our** layer on top of WASB's trajectory (``trajectory_to_action_windows`` + gate + the distilled classifier). So "audio helping detect rallies better" already happens in our code ? the only question is whether audio enters WASB (no) or our rally layer (yes).

And conceptually, audio answers a **different** question than WASB: WASB says **where** the shuttle is on screen; audio says **when** a hit happened. Audio doesn't make WASB localize the shuttle better ? it's an independent rally-activity cue. So fusing them belongs at the layer that **combines cues into rallies**, not inside the shuttle detector.

**So the data flow is:**

```
frames ?? WASB (frozen, MIT) ?? shuttle trajectory ??
 ??? RALLY LAYER (our code) ?? rallies
audio ?? hit detector (our code) ?? hit events ????? (fusion happens HERE)
```

Within that rally layer, "fusion" has **two complementary modes** (both in the plan):

1. **Feature-level fusion** (primary ? refines our rally metrics): add audio features (``hit_rate``, inter-hit cadence/regularity, ``time_since_last_hit``) alongside WASB-derived features (velocity, net-crossings) into the **one distilled classifier** that emits rallies. This is experiment **E3** ? it's literally "use audio to make our rally metrics better."
2. **Decision-level recall-recovery** (corrects WASB's output): where WASB proposed nothing but there's a dense hit-cluster, propose a rally there. This is the "make corrections to WASB output" use ? it directly attacks the recall bottleneck.

This also keeps the architecture **modular**: audio is a **peer cue** sitting beside the shuttle trajectory (and, later, pose), and WASB stays a swappable black box (we could drop in TrackNet without touching the audio path).

**The one scenario that resembles your Option B** isn't WASB at all ? it's a **future** single end-to-end multimodal model that eats frames+audio ? rallies directly (the "HitNet GRU / temporal-action-localization" direction from the research). That's a bigger build needing far more labels, and it'd **replace** the modular stack rather than augment WASB. Not now; noted as a long-horizon option.

The plan doc says "fuse with WASB" but doesn't spell out **that WASB stays frozen and fusion is strictly in the rally layer** ? which is exactly the confusion you just flagged. Want me to add a short **"Integration architecture"** section to ``AUDIO_RALLY_DETECTION_PLAN.md`` (with that diagram + the "WASB is not modified" principle) so it's unambiguous for whoever builds it?

**557. user (2026-06-07T01:46:39.102Z)**

BTW all PRs are merged and look great! Please make sure all slate is clean!

**558. assistant (2026-06-07T01:47:01.842Z)**

On it ? full cleanup pass. Let me sync the indexer, see what's merged, and check both repos.

**559. user (2026-06-07T01:47:08.879Z)**

Already on 'master'

```

#### 571. user (2026-06-07T01:49:49.566Z)

The file C:\Users\avidu\claudel\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md has been updated successfully. (file state is current in your context ? no need to Read it back)

#### 572. assistant (2026-06-07T01:50:02.840Z)

? **\*\*Slate's clean\*\*** ? both repos.

**\*\*Indexer (`badminton-highlight-indexer`):\*\***  
- All PRs **\*\*#25?#32 merged\*\***; `master` is **\*\*202 tests green\*\***, working tree clean, in sync with origin.  
- Branches pruned (local + remote). Remaining: only `feat/khelacharya-shot-intelligence` (the one you chose to keep) and the new chore branch below.  
- **\*\*One thing I caught:\*\*** the #32 merge accidentally carried a **\*\*stale copy of the VLC annotator onto master\*\*** (`tools/vlc\_rally\_annotator/`) ? a divergent duplicate of the standalone repo, exactly what we wanted to avoid. I opened **\*\*PR #33\*\*** to remove it (docs/tooling only). **\*\*Merge #33 and the slate is 100% clean.\*\***

**\*\*Annotator (`rally-annotator`):\*\*** standalone, public, `main` in sync with origin, clean.

**\*\*Net state going forward (all in memory):\*\***

- **\*\*Parked:\*\*** modeling waits on golden labels ? which you now generate yourself via the VLC annotator ? `import-local` / `--labels`.
- **\*\*Next code lever when you resume:\*\*** AUDIO, starting with the **\*\*E1 go/no-go probe\*\*** on your

GoPro audio.

- Decisions documented: ADR-007 (audio next, stance parked), the cited research, and the audio plan.

Only open item is **\*\*PR #33\*\*** (the duplicate removal) ? merge it whenever and everything's pristine. Anything else you want tidied?

**573. user (2026-06-07T01:50:17.906Z)**

and please yes, add more details to that "fuse" explanation in the audio ADR and also do capture the fact you described to me about the option B which is the route once we have a healthy repo of golden eval videos. And that direction makes vital sense to se for now, because eventually (option B) is what I think is the right call, but for now say audio is one and we build a heuristic for stance and other signals then we should be able to fine tune fro our code rather than relying on WASB weights etc.

**574. assistant (2026-06-07T01:51:30.274Z)**

Both worth capturing ? the detailed "where fusion lives" and your Option B end-state (an owned, fine-tuned multimodal model once we have a healthy golden corpus). Let me put the rich version into ADR-007 and reference it from the plan. First, branch and read the current ADR-007 tail on master to anchor the edit exactly.

**575. user (2026-06-07T01:51:32.032Z)**

Switched to a new branch 'docs/audio-fusion-architecture'

=== ADR-007 tail on master ===

295:## ADR-007: Audio "thwack" hit-detection (fused with WASB) is the next rally-detection cue; pose/stance parked

is only as good as the recording.

6. Stay permissive (ADR-005): classical DSP (numpy/scipy, BSD), no restrictive weights; any later model trained

in-house.

**Consequences**

- New `backend/audio/` module (extraction + onset/peak + confidence), feeding `distill\_local` and scored by the existing `metrics.py` / golden loaders. Adds a light **\*\*scipy\*\*** dependency.
- **\*\*All audio measurement is blocked on golden eval labels\*\*** ? which the new VLC rally-annotator (`tools/vlc\_rally\_annotator/`) now lets the owner self-produce, and the collector `import-local` ingests.
- Sport-generic: tennis/table-tennis hits are *\*louder\**, so the cue should transfer at least as well there.
- **\*\*Honest risk:\*\*** if E1 shows shuttle SNR is too poor on real amateur audio, audio is deferred ? this ADR commits to the *\*experiment and direction\**, not to a guaranteed win.

**576. user (2026-06-07T01:52:08.282Z)**

<tool\_use\_error>File has been modified since read, either by the user or by a linter. Read it again before attempting to write it.</tool\_use\_error>

**577. assistant (2026-06-07T01:51:56.157Z)**

On master, ADR-007 still references `tools/vlc\_rally\_annotator/` (the #32 merge took an earlier branch state ? which also explains the stray dir). I'll repoint it here and add the detailed fusion + Option B section.

**578. user (2026-06-07T01:52:15.705Z)**

329  
330     ### Consequences  
331

```

332 - New `backend/audio/` module (extraction + onset/peak + confidence), feeding
`distill_local` and scored by the
333 existing `metrics.py` / golden loaders. Adds a light scipy dependency.
334 - All audio measurement is blocked on golden eval labels ? which the new VLC rally-
annotator
335 (`tools/vlc_rally_annotator/`) now lets the owner self-produce, and the collector
`import-local` ingests.
336 - Sport-generic: tennis/table-tennis hits are *louder*, so the cue should transfer at
least as well there.
337 - Honest risk: if E1 shows shuttle SNR is too poor on real amateur audio, audio is
deferred ? this ADR
338 commits to the *experiment and direction*, not to a guaranteed win.
339

```

The file C:\Users\avidu\Projects\badminton-highlight-indexer\docs\DECISIONS.md has been updated successfully. (file state is current in your context ? no need to Read it back)

#### 580. assistant (2026-06-07T01:52:53.926Z)

Now a cross-reference + Option B in the audio plan's fusion and sequencing sections. Let me anchor on the current text.

#### 581. user (2026-06-07T01:52:54.679Z)

```

38 ~68?77 F) and optionally a tiny MFCC-window classifier (GMM/logreg, hit-vs-not),
bootstrapped from the
39 user's golden rally spans (hits inside rallies = positives). (Research E2.)
40 - Stage 3 ? Hits ? rally structure: cluster impacts by inter-hit gap; a cluster with
?K hits and plausible
41 cadence = a rally; START ? first hit (the serve), END ? last hit + a short tail;
drop isolated single
42 hits (the feed).
43 - Stage 4 ? Fuse with the WASB trajectory:
44 - Recall recovery (the main win): propose a candidate rally wherever there's a
dense hit-cluster but WASB
45 proposed nothing.
46 - Precision / features: add per-candidate audio features ? `hit_count`,
`hit_rate`, inter-hit-interval
47 mean/std (cadence regularity), `time_since_last_hit`, end-of-window energy ? to the
existing
48 `distill_local` student (Research E3).
49 - Joint rule: a rally needs shuttle-motion and a hit-cluster (precision), OR
an audio cluster

```

#### 582. user (2026-06-07T01:53:01.729Z)

The file C:\Users\avidu\Projects\badminton-highlight-indexer\docs\AUDIO\_RALLY\_DETECTION\_PLAN.md has been updated successfully. (file state is current in your context ? no need to Read it back)

#### 583. user (2026-06-07T01:53:09.864Z)

```

66 - Reuse: feed audio features into `backend/eval/distill_local.py` (pluggable
`feature_fn`); score with the
67 existing `metrics.py` / golden loaders.
68 - Deps: prefer numpy + scipy (BSD) for filtering/STFT (numpy already present;
scipy is permissive and
69 light). Avoid heavy/AGPL audio stacks. Any later small CNN = trained in-house (no
restrictive weights).
70 - Licensing: all permissive ? no new model weights for Stage 1. Consistent with
ADR-005.
71
72 ## 7. Risks & mitigations

```

73 - **\*\*Shuttle SNR (top risk):\*\*** E1 is the empirical gate; if NO-GO, audio is deferred, not forced.  
74 - **\*\*No crowd applause\*\*** in amateur single-camera clips (a cue the literature leans on for end-of-point) ? rely  
75 on **\*\*hit-cadence cessation\*\***, not applause.  
76 - **\*\*Mic occlusion / wind\*\*** ? recording guideline (audio on, unobstructed, avoid aggressive wind-suppression).  
77 - **\*\*A/V sync:\*\*** audio and frames share the same file timeline ? no sync work needed.

**584. user (2026-06-07T01:53:14.323Z)**

79 ## 8. Gating & sequencing  
80 - All measurement is **\*\*gated on golden labels\*\*** (user rating via the VLC annotator ? ``import-local`` / the  
81 `in-repo`--labels` loaders`). So: rate a few videos ? **\*\*E1 go/no-go\*\*** ? E2/E3.  
82 - Roadmap order: **\*\*AUDIO (now)\*\*** ? `*[a TBD owner hunch ? slot reserved]*` ? **\*\*POSE/STANCE**  
(#2, parked;  
83 expected substantially harder)\*\*.  
84  
85 ## 9. Success criteria  
86 - **\*\*E1:\*\*** audio hit-clusters recover a meaningful share of WASB-missed golden rallies on real GoPro audio  
87 (recall lift), with hit-clusters aligning to true rallies. Pass ? proceed; fail ? defer audio, revisit mic/setup.  
88 - **\*\*E3:\*\*** the fused model's held-out (LOVO) F1 beats both the WASB-only baseline and the trajectory-only  
89 distilled student.  
90

The file C:\Users\avidu\claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md has been updated successfully. (file state is current in your context ? no need to Read it back)

**589. assistant (2026-06-07T01:54:12.192Z)**

PR #34 is up. Let me update the memory checkpoint to reflect both open docs PRs.

**590. assistant (2026-06-07T01:54:39.781Z)**

Captured exactly as you framed it. Here's what went into ADR-007 (new **\*\*"Integration architecture"** section) + the plan doc, in PR #34:

**\*\*Option A (now) ? the detailed "fuse" explanation:\*\***  
- **\*Why not feed audio into WASB:\*** WASB is a **\*\*frozen, vision-only shuttle detector\*\*** (frames ? x,y,visibility; MIT weights we run, not train). It has no audio path, doesn't decide rallies at all, and bolting audio on would mean **\*\*retraining\*\*** with per-frame shuttle+audio labels we don't

have (forking the MIT model). And audio answers a *different* question ? *"when"* a hit happened\*\*, not *"where"* the shuttle is.

- *\*So fusion lives in our rally layer,\** in two modes: *\*\*feature-level\*\** (audio features ? the single distilled classifier, E3) and *\*\*decision-level recall-recovery\*\** (a hit-cluster where WASB found nothing ? propose a rally). Each cue stays a swappable black box. Added a data-flow diagram.

*\*\*Option B (the intended destination) ? your call, now documented:\*\**

> Once a healthy golden corpus exists, *\*\*collapse the modular cues into a single OWNED end-to-end multimodal model\*\** (frames + audio + pose/stance + ? ? rallies), *\*\*fine-tuned on our own data instead of depending on WASB's pretrained weights\*\** ? removing both the recall ceiling WASB's windows impose and the licensing question on its academic weights.

And the rationale you gave ? that the modular cues aren't a detour: *"Option A is how we earn Option B."* Each cue (audio ? stance heuristic ? other signals) is cheap, debuggable, and *\*generates the very labels\* the end-to-end model will need. We jump to B only when the data supports training it.*

*\*\*To fully clean the slate, two small docs/chore PRs to merge:\*\**

- *\*\*#33\*\** ? removes the stale annotator copy that slipped onto master.
- *\*\*#34\*\** ? this ADR-007 expansion (+ repoints the annotator reference).

No conflicts between them. After both merge, master is pristine, the audio direction is fully specified, and Option B is on the record as the north star. ?

#### 591. user (2026-06-07T01:54:41.678Z)

PR #33 is merged. Can you update your current PR so merging it is safe?

#### 592. assistant (2026-06-07T01:55:14.514Z)

PR #33 merged. Now I'll rebase PR #34 onto the updated master ? its branch still carries the old (pre-#33) state including the stale `tools/`` dir, so rebasing drops that and replays only the docs changes, making the merge clean and unambiguous.

#### 593. user (2026-06-07T01:55:19.105Z)

Already on 'master'

```

=== does master still have the stale tools/ ADR ref? ===
0
```

#### 596. assistant (2026-06-07T01:56:15.797Z)

Plot twist (a good one): \*\*PR #34 is already merged too\*\* ? master's log shows `53f6ae9 ... (#34)`. The rebase came up empty because there's nothing left to merge, and master already has the correct content: the "Integration architecture" section is in, the stale `tools/` reference is repointed, and `tools/` stays removed. So it merged \*\*safely\*\* ? exactly the clean 3-way result we wanted. Let me confirm and clean up the now-redundant branch.

#### 597. user (2026-06-07T01:56:25.391Z)

#### 600. assistant (2026-06-07T01:56:53.554Z)

Fully clean now. Updating the checkpoint, then a quick recap.

#### 601. user (2026-06-07T01:56:57.501Z)

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md has been updated successfully. (file state is current in your context ? no need to Read it back)

#### 602. assistant (2026-06-07T01:57:10.925Z)

All done ? and your instinct was right to check, but it turned out **#34** had already merged too, and it merged safely. **I** verified master ended up exactly correct:

- ? "Integration architecture" section (Option A / Option B) present
- ? annotator reference repointed to the standalone repo
- ? stale `tools/vlc_rally_annotator/` stayed removed (the merge didn't resurrect it)

The rebase I ran confirmed it (the branch had **zero** unique changes left = fully merged), so no force-push was needed. Why it was safe despite the stale base: #34's diff only touched the two docs files, so applying it on top of #33's removal kept `tools/` gone ? git's 3-way merge did the right thing.

**Slate is now pristine:**

- `master` only (local), working tree clean, in sync with origin.
- **No open PRs**; all of #25?#34 merged.
- Remote: just `feat/khelacharya-shot-intelligence` (the one you chose to keep). Pruned every other merged branch.
- `rally-annotator` standalone repo: clean, `main` in sync.

Net: everything's merged and tidy, the audio direction (Option A now ? Option B end-state) is fully documented in ADR-007, and we're parked on golden labels ? whenever you've rated a clip with the annotator, ping me and I'll run the **E1 audio go/no-go probe**. ??

#### 603. user (2026-06-07T01:57:12.821Z)

PR 34 also merged. Do we have a clean slate now? Also are you silently ensuring session handoff and current states are updated?

#### 604. assistant (2026-06-07T01:57:39.516Z)

Good ? let me verify the slate fresh, and answer your second question honestly (it deserves a straight answer, not a "yes" by reflex).

#### 605. user (2026-06-07T01:57:45.292Z)

```
=== open PRs ===
(empty = none)
=== local branches ===
* master

=== tree + sync ===
master...origin/master
=== #34 state ===
MERGED
```

#### 606. assistant (2026-06-07T01:57:57.510Z)

**Clean slate confirmed** ? ? no open PRs, `master` only (local), working tree clean and in sync, just the retained `feat/khelacharya-shot-intelligence` remote branch. All of #25?#34 merged.

Now the honest answer on memory:

- **current-state.md** ? yes, I've been updating it **continuously** at every checkpoint this session (it's the live file).
- **session-handoff.md** ? **no**, not silently. By your own convention it's **updated only on request** (the slower ~1-page orientation), so I held off auto-rewriting it. But you're right to flag it: after today (audio decision, distilled model, standalone annotator repo, research) it's now **significantly stale**. Since you're asking me to ensure both are current, I'll refresh it now. Let me read it first, then rewrite.

#### 607. user (2026-06-07T01:57:58.086Z)

10 # Session handoff ? badminton-highlight-indexer (+ sibling sports-data-collector)
11
12 **Last updated:** 2026-06-06 . **Refresh trigger:** say "update the handoff".
13 Pointer, not a duplicate. **For the freshest blow-by-blow state, read [[current-state]]
first**
14 (updated every micro-checkpoint); this handoff is the slower ~1-page orientation.
15
16 ## You are here (current state)
17 - **Roora pilot reviewed** (badminton only delivered, as CVAT boxes). User verified
all rallies:
18 only the flagged ones are issues; everything else is **clean trainable data**.
Feedback PDF +
19 1:46 screenshot in `Projects/Annotation Setup/6 June 2026/Feedback/`. Golden labels
(corrected,
20 two-field) at `Projects/Annotation Setup/golden_labels_badminton.csv`.
21 - **Ingestion pipeline built (collector)** ? merged: CVAT?canonical adapter (`convert-
cvat`),
22 forced/unforced vocab, `last_shot_outcome` two-field (+ db migration). In PR: **9
23 `validate-delivery`** (per-video QA gate ? report.md/.json + auto review.csv; FAQ in
24 `docs/INGESTION_PIPELINE.md`).
25 - **Indexer** ? merged: rally **slicer** (`backend/tools/rally_slicer.py`) + docs.
26 - VLC media-time overlay is permanent (Lua `timeosd` intf) for manual verification.
27
28 ## Next steps / open threads
29 - **Clean slate (2026-06-06 wrap):** all WASB work MERGED ? PR #21 (substrate
wasb_infer/runner/
30 wasb_hybrid + calibration.py + calibrate_wasb driver + HOW_RALLY_DETECTION_WORKS) and
PR #22
31 (GPU throughput: batch/workers). master clean; suite 171 green.
wasb_infer/runner/hybrid ?,
32 eval+calibration harness ?, calibration driver ?.
33 - **Step 4 ? FIRST CALIBRATION DONE** (2026-06-06): on 25 golden rallies, baseline F1
0.588 ?
34 tuned (0.05,1.0,1.0) **F1 0.746** (+26.8% / precision +12.2%, *optimistic* = grid fit
on full GT);
35 **honest 5-fold held-out recall 0.88 ± 0.16, generalization_gap +0.000 (no overfit).**
Trajectory
36 cached `~/clips/sample_long_traj.csv` (+ C:\?\Temp). Driver `calibrate_wasb.py` was
lost from
37 master in #21's branch-delete ? recovered in **PR #24** (merged). NEXT: export tuned
segments for
38 user eyeball; 2nd labelled video ? honest cross-video precision
(`leave_one_video_out`); WASB-pass
39 checkpointing; optional multi-agent tuning Workflow. ? Historical detail of the first
pass: Frames extracted (21,284 JPGs in
40 `C:\?\Temp\sample_long_frames`, via ffmpeg ~3.5min ? cv2 too slow). Inference running
(GPU ~80-90%);
41 trajectory ? `~/clips/sample_long_traj.csv`. Survives reboots? NO yet (see plan
below). To run/
42 resume: `wsl ? conda activate wasb && cd ~/models/WASB-SBDT/src && python
wasb_infer.py
43 --frames_dir /mnt/c/Users/avidu/AppData/Local/Temp/sample_long_frames --weights
44 ../pretrained_weights/wasb_badminton_best.pth.tar --out ~/clips/sample_long_traj.csv
45 --batch-size 8 --num-workers 4`. Then **Checkpoint 4:** `python -m
backend.eval.calibrate_wasb

```

```

46 --trajectory <traj> --labels golden_labels_badminton.csv --fps 59.94 --frame-width
1920` ?
47 the "+X%" + cross-val; export tuned segments ? user manual-verifies "are rallies
better?".
48 - **? TODO (next session): implement WASB-pass checkpointing** so reboots resume (a
reboot lost
49 the inference once). Full design in [[current-state]] ("PLAN: checkpoint the
heavyweight WASB
50 pass"): cache per-frame DETECTOR outputs incrementally (flush every ~1000) in a stable
51 md5-keyed cache dir; re-run the cheap CPU tracker over the cache; idempotent
extraction; atomic
52 writes.
53 - See [[current-state]] for exact gotchas (/mnt/g not visible, ffmpeg-not-in-WSL,
gpu=[0]) + the
54 2-layer model
55 in indexer `docs/HOW_RALLY_DETECTION_WORKS.md`.
56 - **GOAL CORRECTION (important):** rally labels are temporal ? they tune the
segmentation layer
57 (thresholds), NOT WASB's shuttle-detector weights (those need x,y labels). The
"quantifiable
58 improvement" is held-out rally IoU lift from per-video threshold calibration. Genuine
detector
59 weight fine-tuning = separate track needing shuttle-coordinate labels.
60 - **Roora go/no-go:** send the PDF, get verbal confirmation issues are addressable, then
require a
61 **corrected pilot re-delivery that passes `validate-delivery`** (esp. zero missed
rallies) BEFORE
62 committing to the 5?6 bulk 30-min videos. Pickleball + TT still not delivered.
63 - Bulk data incoming (5?6 × 30-min) ? validation gate is now ready for it.
64
65 ## Ramp-up kit (read these to get current)
66 - [[current-state]] (live), this handoff, [[working-agreement-checkpoints]], [[working-
agreement-attribution]].
67 - **For CODE/architecture: read `docs/CODE_MAP.md` FIRST** (dense anchor-rich map of the
whole
68 repo ? pipeline, subsystems, data contracts, gotchas, ramp paths). See [[code-map-
artifact]].
69 - Collector: `docs/INGESTION_PIPELINE.md` (E2E FAQ), `docs/annotation/ROORA_BRIEF.md` +
`ANNOTATION_GUIDE.md`,
70 `src/parsers/cvat/rally_cvat.py`, `src/cli/curate.py` (convert-cvat / validate-
delivery / import-local / export).
71 - Indexer: `backend/tools/rally_slicer.py`, `backend/eval/{metrics,annotations}.py`,
`backend/stitcher/compiler.py`.
72 - Memory notes: golden-set-vendoring, collector-indexer-bridge, candidate-segments-
finetuning.
73
74 ## Key decisions (don't relitigate without reason)
75 - **Accept Roora's CVAT export** ; absorb format + timestamps in our adapter (don't make
them change workflow).
76 - **Two-field ending** : `ending_reason` (why) + `last_shot_outcome` (in/net/out/n_a,
where).
77 - Time = `frame / true_fps` (ignore vendor's frame/900); ~0.5s slack absorbed by
compiler padding.
78 - Per-video adaptation = **calibration first** (static camera), honest eval on held-out
rallies; never mix train/eval globally.
79 - Workflow: frequent **small PRs** + continuous [[current-state]] updates (this handoff
only on request).
80

```

#### 608. assistant (2026-06-07T01:58:27.735Z)

You're right ? `session-handoff.md` is stuck at the "first calibration / checkpointing-TODO" state from early today; everything since (checkpointing, calibration ceiling, distilled model, Gemini teacher?student, audio decision, standalone annotator repo) is missing. Refreshing it now to match reality.

## 609. assistant (2026-06-07T01:58:45.172Z)

```

name: session-handoff
description: "Living \"you are here\" handoff for this project ? current state, next steps, open
decisions, ramp-up kit. Updated only on request (\"update the handoff\")."
metadata:
 node_type: memory
 type: project
 originSessionId: eb4b7b53-2f77-4c4d-83e1-4fa5e77f3e3f

```

## Session handoff ? badminton-highlight-indexer (+ siblings: sports-data-collector, rally

**\*\*Last updated:\*\*** 2026-06-07 · **\*\*Refresh trigger:\*\*** say "update the handoff".  
Pointer, not a duplicate. **\*\*For the freshest blow-by-blow state, read [[current-state]] first\*\***  
(updated every micro-checkpoint); this handoff is the slower ~1-page orientation.

### You are here (2026-06-07)

```
- **Rally-detection stack matured & all merged.** WASB shuttle-trajectory substrate is
**resumable/
 checkpointed** (md5-ish cache, incremental detector flush, tracker re-run). On top: a rally
layer =
 windowing thresholds + a **net-crossing "gate A" + a **distilled classifier**
(`distill_local`).
 Eval harness: `calibrate_wasb` / `calibration.py` (LOVO) / `metrics.py`.
- **Honest core finding:** WASB-only threshold tuning **ceilings ~F1 0.44** and the learned
distilled
 model **underperforms the baseline at n=2 videos**. The blocker is **golden data + WASB
candidate
 recall**, not the method. (Gemini-as-teacher gave us the first real measurement.)
- **Strategy decided (ADR-007):** Gemini = **offline teacher only**; **AUDIO** hit-detection is
the next
 local cue, **fused in our rally layer** (WASB stays a frozen black box) ? Option A.
**Pose/stance =
 parked #2. **Option B = the eventual end-state**: one OWNED end-to-end multimodal model
 (frames+audio+pose+rallies) fine-tuned on our data, dropping WASB-weight dependence + the
recall ceiling.
- **Golden data path:** owner **self-rates** clips with the new **standalone VLC annotator
repo**
 (github.com/avidullu/rally-annotator, MIT, multi-sport) ? CSV ? in-repo `--labels` loaders /
collector
 `import-local`. Human labels > the Gemini silver labels the model was starving on.
- **Both repos clean.** Indexer: PRs #25?#34 merged, master green (202 tests), tree clean.
Annotator:
 public, `main` clean. Modeling is **PARKED** pending golden labels.
```

### Next steps / open threads

- \*\*Owner:\*\*** rate a few clips in VLC (annotator v1.2 ? needs a live multi-sport smoke test),  
and/or merge  
nothing pending (none open).
- \*\*Then E1 (audio GO/NO-GO):\*\*** extract audio ? energy-peak hits ? overlay on WASB windows +  
golden labels  
? does audio recover WASB-missed rallies on **\*\*real GoPro audio\*\***? (Top risk = quiet shuttle  
SNR.) Full  
plan: `docs/AUDIO\_RALLY\_DETECTION\_PLAN.md` (E1?E4). Build `backend/audio/hit\_detector.py`  
(numpy+scipy)  
if E1 passes; then E3 = fuse audio features into `distill\_local`.
- Stance heuristic (#2) after the owner's "other hunch"; Option B once the corpus is healthy.
- Cached artifacts LEFT IN PLACE for re-use (owner will rate): `Temp\{adarsh,testlarge}\_frames`  
+ trajectories;  
`Temp\verylarge\_frames` (partial). Adarsh/TestLargeVideo trajectories are ready to feed  
calibration.

## Key decisions (don't relitigate without reason)

- **Audio now ? stance parked ? Option B eventual** (ADR-007). Modular cues are how we **\*earn\*** Option B (each is cheap/debuggable and generates the labels the end-to-end model needs).
- **Fusion is in OUR rally layer, never inside WASB** (WASB = frozen vision-only shuttle **\*detector\***; no audio path; retraining needs x,y+audio labels we lack). Two modes: feature-level (? distilled classifier) + decision-level recall-recovery. (ADR-007 §Integration architecture.)
- **Local-only inference = privacy lever**; **\*permissive licensing only\*** (ADR-005); Gemini paid+offline only.
- **Distilled model > threshold tuning** is the direction, but **\*needs more videos\*** (n=2 overfits).
- Per-video adaptation = calibration on held-out; never mix train/eval. Frequent **\*small PRs\*** + continuous [[current-state]] updates (this handoff on request only).

## Ramp-up kit (read these to get current)

- [[current-state]] (live blow-by-blow), this handoff, [[working-agreement-checkpoints]], [[working-agreement-attribution]], [[feedback-tail-long-job-logs]].
- **CODE/architecture**: ``docs/CODE_MAP.md`` FIRST (dense map). See [[code-map-artifact]].
- **Strategy/decisions**: ``docs/DECISIONS.md`` (esp. **ADR-007** audio), ``docs/RALLY_DETECTION_RESEARCH.md`` (cited methods survey), ``docs/AUDIO_RALLY_DETECTION_PLAN.md``, ``docs/VIDEO_RECORDING_GUIDELINES.md`` (audio now required).
- **Key code**: ``backend/eval/{distill_local,calibrate_local,calibrate_wasb,gemini_refine,metrics,calibration}.py``, ``backend/detectors/{wasb_infer,wasb_runner,rally_gate,tracknet_runner}.py``.
- **Annotator repo**: ``C:\Users\avidu\Projects\rally-annotator`` (+ installed at ``%APPDATA%\vlc\lua\extensions\``).
- Memory notes: golden-set-vendoring, collector-indexer-bridge, candidate-segments-finetuning, sibling-internship-repo.

### 610. user (2026-06-07T01:58:45.184Z)

The file `C:\Users\avidu\claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\session-handoff.md` has been updated successfully. (file state is current in your context ? no need to Read it back)

### 611. assistant (2026-06-07T01:59:18.535Z)

Both questions answered straight:

- \*1. Clean slate ? yes, confirmed (just re-verified):\***
  - No open PRs; #25?#34 all merged.
  - ``master`` only (local), working tree clean, in sync with origin.
  - Remote: only ``feat/khelacharya-shot-intelligence`` (the branch you chose to keep).
  - ``rally-annotator`` repo: clean.
- \*2. Memory ? honest status (not a reflexive "yes"):**
  - ``current-state.md``: yes, continuously ? I've updated it at every checkpoint all session (it's the live micro-checkpoint file).
  - ``session-handoff.md``: no, not silently ? by your own documented convention it's **\*updated only on request,\*** so I deliberately hadn't auto-rewritten it. That meant it had gone **\*stale\*** (it was still describing the Roora pilot / first-calibration / checkpointing-TODO from this morning). Since you're asking me to ensure it's current, **\*I've just fully refreshed it\*** to reflect reality: the matured stack, the honest n=2 finding, ADR-007 (audio now / stance parked / Option B end-state), the self-rating golden-data path, the standalone annotator repo, and an updated ramp-up kit.

So right now both are accurate.

**\*One thing to align on going forward:** there's a small tension ? the **\*global\*** convention says refresh the handoff at meaningful checkpoints (PR merges, key decisions, phase shifts), but

\*this project's\* handoff note says "on request only," which is exactly why it drifted. Want me to switch it to **\*\*auto-refresh at meaningful checkpoints\*\*** (so it never goes stale again, alongside the always-live `current-state`)? I'd still keep the fine-grained churn in `current-state` and only touch the handoff on real phase shifts ? but it'd stay honest without you having to ask. Say the word and I'll update the convention note.

#### 612. user (2026-06-07T01:59:20.200Z)

Is there some way session handoff updates are also done more frequently than what you saw and avoid the uber staleness?

#### 613. assistant (2026-06-07T02:00:17.003Z)

Yes ? and the honest root cause is the policy itself: the handoff said **\*\*update only on request,\*\*** so it sat untouched. The fix is to flip that to **\*\*checkpoint-driven refresh\*\***, and encode it where future-me actually reads it each session (the working-agreement memory). Let me look at that memory first.

#### 614. user (2026-06-07T02:00:17.807Z)

```
1 ---
2 name: working-agreement-checkpoints
3 description: "Standing user preference ? check code in frequently as small PRs; keep a
Claude-consumable current-state/checkpoint file updated at every micro-checkpoint"
4 metadata:
5 node_type: memory
6 type: feedback
7 originSessionId: b13673cc-f087-43b1-9527-35dc0b67b301
8 ---
9
10 Standing working preference (user confirmed 2026-06-06).
11
12 **The rule:** commit/check-in code **very periodically** as **small PRs** (micro-
checkpoints),
13 and at each micro-checkpoint clearly record progress in a **`current-state` file written
for
14 Claude's consumption** ? so a future session (or the user) can resume from the file, not
from
15 replaying the conversation. The living file is [[current-state]] (memory dir); per-repo
state
16 docs are fine too when a feature spans many commits.
17
18 **Why:** the user runs long multi-step build/verify loops across two repos and wants
frequent,
19 reviewable checkpoints rather than one big PR; the state file is the durable hand-off so
context
20 isn't lost between sessions.
21
22 **Long-running jobs must be observable + resumable (user, 2026-06-06):**
23 - **Periodic flushed progress logging** with ETA ? never a multi-minute (or longer)
process that's
24 a black box until it finishes. (Done for `wasb_infer` per-N-batches; apply the same to
any heavy
25 pass.) Flushed plain lines (not `\\r` bars) so they show in background-task logs.
26 - **Checkpoint heavyweight compute** so a restart resumes, not restarts (see the WASB
checkpointing
27 plan in [[current-state]] ? incremental cache of the expensive stage + cheap re-run of
the rest).
28
29 **How to apply:**
30 - Prefer many small, isolated branches/PRs over one large one (see [[session-handoff]]
for the
31 isolation convention). Push + open the PR when a coherent unit is done ? don't sit on
commits.
```

32 - After each meaningful commit/PR, update the current-state file: what landed, what's next,  
33 any open decisions. Keep it terse and Claude-readable.  
34 - **\*\*Two docs, both kept fresh automatically\*\*** (user upgraded this 2026-06-06; global CLAUDE.md  
35 updated to match):  
36 - **[[current-state]]** ? granular/live, flushed at **\*\*every\*\*** micro-checkpoint.  
37 - **[[session-handoff]]** ? ~1-page orientation, **\*\*auto-refreshed at meaningful checkpoints\*\*** (PR  
38 pushed/merged, key decision, phase shift, session wrap-up) ? no longer on-request-only. The  
39 "update/refresh the handoff" phrases still force an immediate full rewrite.  
40 - Don't rewrite either every turn ? only when something worth resuming from changed.  
41

#### 615. assistant (2026-06-07T02:00:48.019Z)

The working-agreement memory *\*already\** says "auto-refresh at meaningful checkpoints" (lines 34-39) ? the bug was that the **\*\*handoff** file itself still said "on request only,"\*\* contradicting it, and I followed the file's own note. So the real fix is to align the handoff file to the policy and add a concrete staleness tripwire. Doing that now, per your confirmation.

#### 616. user (2026-06-07T02:00:51.011Z)

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\session-handoff.md has been updated successfully. (file state is current in your context ? no need to Read it back)

#### 617. user (2026-06-07T02:00:59.400Z)

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\session-handoff.md has been updated successfully. (file state is current in your context ? no need to Read it back)

#### 618. assistant (2026-06-07T02:01:11.089Z)

Now encode the staleness tripwire + the root-cause lesson in the working agreement (the memory I read every session start):

#### 619. user (2026-06-07T02:01:16.527Z)

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\working-agreement-checkpoints.md has been updated successfully. (file state is current in your context ? no need to Read it back)

#### 620. assistant (2026-06-07T02:01:53.690Z)

Done ? and the root cause is now fixed at the source, not just patched:

**\*\*What I changed (so it can't silently drift a whole session again):\*\***

1. **\*\*Flipped the handoff's own policy note.\*\*** Its frontmatter + header now say **\*\*"auto-refresh at meaningful checkpoints"\*\*** (PR merged · key decision/ADR · phase shift · session wrap) ? the contradicting **\*\*"on request only"\*\*** line (the actual culprit ? I followed the file's own note) is gone.
2. **\*\*Added a concrete staleness tripwire\*\*** to both the handoff and the working-agreement memory:  
    > if ?3 substantive `current-state` checkpoints ? \*or any PR-merge / new ADR / phase shift\* ? have landed since the handoff's "Last updated" date, refresh it now.  
    Practically: **\*\*any turn where I update `current-state` for a merge/decision/phase-shift, I also touch the handoff.\*\***
3. **\*\*Recorded the lesson\*\*** in `working-agreement-checkpoints` (which I read at every session start): **\*the handoff file's own note must match the auto-refresh policy\*** ? the mismatch is exactly what caused today's drift.

Since these live in the memory I load at session start, future-me inherits the rule

automatically.

**\*\*On true harness enforcement (honest):\*\*** a hook that fires after *every* response would be noise here ? ``current-state`` updates almost every checkpoint, so it'd always look "newer" than the handoff and cry stale constantly. The clean version is a **\*\*SessionStart hook\*\***: once per session, compare the two files' timestamps and, only if the handoff genuinely lagged last session, surface "? handoff may be stale ? refresh per the tripwire." That's low-noise and catches the case where a session ended without a refresh.

Want me to add that SessionStart staleness-nudge hook to ``settings.json`` ? It's a real belt-and-suspenders layer on top of the policy ? I'd just need a nod since it edits your harness config (and I'd put it in project settings unless you prefer global).

#### 621. user (2026-06-07T02:01:55.547Z)

Would it be wise to ask you for kicking off the audio scaffolding work while I prepare the next few videos using your shiny new vlc plugin?

#### 622. assistant (2026-06-07T02:02:51.160Z)

Good question ? and yes, it's wise, *\*if we scope it to avoid building past the one make-or-break gate\**. Before I answer concretely, let me verify one thing that changes the whole shape of this: do the videos you already gave me actually carry usable audio? If so, I can de-risk the core question *\*today\** instead of waiting.

#### 623. user (2026-06-07T02:02:53.961Z)

```

#### 624. assistant (2026-06-07T02:03:34.225Z)

All three are **\*\*48 kHz stereo AAC\*\*** (~189 kbps) ? solid audio. That changes the answer from "yes, parallelize" to **\*\*yes ? and we don't even have to wait.\*\***

**\*\*My recommendation: yes, kick it off ? with one discipline: build only \*up to and through E1\*, defer everything downstream.\*\***

The reason it's safe to start: the audio **\*\*scaffolding \*is\* the E1 tool.\*\*** E1 = "extract audio ? detect hit peaks ? overlay on rally spans ? does it recover WASB-missed rallies?" So building the hit detector isn't premature work that might get shelved ? it's the literal prerequisite for the go/no-go gate. What I'll **\*\*defer\*\*** until E1 passes: fusion into ``distill_local`` (E3), windowing integration ? the stuff that's wasted if shuttle audio turns out too quiet.

**\*\*The bonus (the real unlock): I can run a \*preliminary\* E1 today, before your new labels exist.\*\*** We already have, on disk: the GoPro audio (those 3 videos ?), the cached **\*\*WASB trajectories\*\*** (Adarsh, TestLargeVideo), and **\*\*Gemini silver labels\*\*** (Adarsh = 36 rallies, TestLargeVideo = 7). So I can answer the make-or-break question ? *\*does a shuttle "thwack" even survive GoPro audio well enough to find hits during rallies?\** ? **\*\*now\*\***, against silver labels. Your human-rated videos then give the authoritative confirmation.

So, concretely, if you say go:

1. `backend/audio/hit_detector.py` ? ffmpeg extract ? numpy onset/energy-peak detection + confidence. Pure DSP, unit-tested on synthetic clicks. (numpy-first; I'll avoid adding scipy unless it's clearly needed ? keeps deps minimal/permissive.)
2. `An E1 harness` ? given audio + a labels CSV (+ WASB trajectory), report whether hit-clusters align with rallies and how many WASB-missed rallies they'd recover.
3. `Run preliminary E1` on Adarsh + TestLargeVideo (existing audio vs Gemini silver + WASB windows) ? an early SNR/efficacy verdict.
4. `Stop there` and bring you the numbers before building any fusion.

That way, by the time you've rated a few clips, we'll already *know* whether audio is worth the downstream build ? and if it is, the detector's ready to plug in.

Green light? (And it's a clean parallel track ? your rating in VLC and my audio probe don't touch the same files.)

**625. user (2026-06-07T03:13:13.604Z)**

go get it!

**626. assistant (2026-06-07T03:14:40.588Z)**

Let's go. Building the audio hit-detector (numpy + ffmpeg, no scipy), an E1 probe harness, tests, then running the preliminary E1 on the GoPro audio we already have.

**627. user (2026-06-07T03:14:42.018Z)**

Chapter marked: "Audio scaffolding + E1 probe". Continue your current work.

### 632. assistant (2026-06-07T03:15:41.932Z)

Now the E1 probe harness:

### 633. assistant (2026-06-07T03:15:58.583Z)

"""E1 ? audio GO/NO-GO probe (docs/AUDIO\_RALLY\_DETECTION\_PLAN.md).

Answers, on REAL audio: does the shuttle "thwack" survive well enough that hit

peaks (a) cluster inside rallies far more than dead time, (b) recover rallies the WASB windows miss (our recall bottleneck), and (c) form usable audio-only rally proposals? No training, no fusion ? purely diagnostic, so we know whether to build the rest of the audio path.

Reuses: audio.hit\_detector, calibrate\_wasb.load\_golden\_gts/make\_predict\_fn, eval.metrics. Labels may be human-gold OR Gemini-silver ? silver is fine for the SNR/efficacy question E1 asks.

"""

```

x = (rng.standard_normal(int(sr * dur)) * 0.002).astype(np.float32) # quiet background
burst = int(0.005 * sr) # 5ms transient

```

(\*\*56?64 hits/min\*\*) ? the detector is firing almost as much in dead time as in rallies. So at k=2.5 it's catching lots of \*non-shuttle\* transients (footwork, voices, ambient), and audio-only segmentation is poor (F1 0.13?0.27, well below WASB's). That's the shuttle-SNR risk showing up.

Before I call the gate, let me check the key question: are real shuttle hits the \*loudest\* transients (so a stricter threshold cleanly isolates them)? A quick k-sweep on Adarsh:

#### 645. user (2026-06-07T03:18:15.943Z)

```
dur=676s rally=152s dead=524s | 36 rallies
 k hits hits/min in/s dead/s ratio rallies>=2hits
2.5 632 56.1 1.17 0.87 1.3 36/36
 4 246 21.8 0.72 0.26 2.8 30/36
 6 7 0.6 0.01 0.01 1.4 0/36
 8 0 0.0 0.00 0.00 99.0 0/36
 12 0 0.0 0.00 0.00 99.0 0/36
 16 0 0.0 0.00 0.00 99.0 0/36
```

#### 646. assistant (2026-06-07T03:19:01.956Z)

**\*\*That's the key finding\*\*** ? there's a clear sweet spot and a clear ceiling:

```
| k | hits/min | in-rally/s | dead-time/s | **discrimination** | rallies w/ ?2 hits |
|---|---|---|---|---|
| 2.5 | 56 | 1.17 | 0.87 | 1.3x | 36/36 |
| **4** | **22** | **0.72** | **0.26** | **2.8x** | **30/36** |
| 6 | 0.6 | ? | ? | (collapses) | 0/36 |
```

So shuttle hits **\*\*are\*\*** somewhat louder than dead-time noise (discrimination climbs to **\*\*2.8x\*\*** at k=4 while still covering 30/36 rallies), but there's a cliff ? and even at best it's only ~2.8x, not the 5?10x that would make audio clean on its own. Let me confirm the suite's green and commit the E1 tooling, then give you the honest verdict + the next lever.

#### 651. assistant (2026-06-07T03:19:57.327Z)

PR #35 up. Per the new auto-refresh policy, let me update both memory files with the E1 outcome (it's a meaningful checkpoint), then give you the verdict.

#### 652. user (2026-06-07T03:20:30.641Z)

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\session-handoff.md has been updated successfully. (file state is current in your context ? no need to Read it back)

#### 653. assistant (2026-06-07T03:20:57.011Z)

Here's the honest E1 verdict, and where I'd go next.

### E1 verdict: AMBER ? promising for \*recall\*, not clean enough to stand alone (yet)

**\*\*Built & shipped\*\*** (PR #35, 207 tests): the audio hit-detector + E1 probe ? numpy/ffmpeg, no scipy, WASB untouched.

**\*\*The good (real signal):\*\***

- Audio fires in **\*\*100% of rallies\*\*** on both videos.
- **\*\*100% of the rallies WASB \*misses\*\*** have audio hit-clusters ? audio could directly attack our recall bottleneck.

**\*\*The caution (why it's amber):\*\***

- **\*\*Discrimination is only ~2.8x\*\*** at best (in-rally vs dead-time hit density), with a sensitivity cliff just past  $k=4$ . At default sensitivity it's 1.3x and ~56 hits/min ? the broadband detector is catching lots of \*non-shuttle\* transients (footwork, voices, ambient).
- **\*\*Audio-only F1 (0.13?0.27) trails WASB\*\*** ? audio is a **\*\*fusion/recall cue, not a standalone segmenter\*\***.

**\*\*Two honest caveats that make this a floor, not a ceiling:\*\***

1. These are **\*\*Gemini \*silver\* labels\*\*** ? the "dead time" likely contains unlabeled activity (warm-up hits, knock-ups), which **\*inflates\*** the dead-time hit count and **\*understates\*** the true discrimination. **\*\*Your human-gold labels will sharpen this.\*\***
2. The detector is **\*\*v1 broadband\*\*** (pre-emphasis only). The obvious untried precision lever is a **\*\*shuttle-band band-pass\*\*** ? a shuttle "click" is HF-rich; voices/footsteps are lower-frequency, so band-passing should separate them and lift discrimination well above 2.8x.

### The decision (your call)

- **\*\* (A) I add the shuttle-band band-pass now\*\*** ? cheap, no labels needed, still pre-fusion. It directly tests "can we make the audio signal clean?" If discrimination jumps (say 4?6x), audio fusion becomes clearly worth building; if it doesn't budge, that's a strong honest signal to lean on stance instead. **\*\*My recommendation\*\*** ? highest info per effort, and it parallelizes with your rating.
- **\*\* (B) Pause audio, wait for your human-gold labels\*\***, then re-run E1 to get the true (un-penalized) discrimination before any more detector work.

I lean **\*\* (A) \*\*** ? it's a quick, label-free experiment that either greenlights audio or tells us to pivot, while you keep rating. Want me to go? (And memory's already refreshed per the new auto-checkpoint policy ? both `current-state` and the handoff reflect this E1 result.)

#### 654. user (2026-06-07T03:48:13.763Z)

Please go ahead with A while I take my shower, praise the Lords, complete my breakfast and get back to you! I will take a wholistic look once am back.

#### 655. assistant (2026-06-07T03:49:05.916Z)

On it ? you go enjoy your morning. ??? I'll add the shuttle-band band-pass, sweep bands x sensitivity on both clips, find the best operating point, and have a holistic write-up ready when you're back.

Let me switch to the audio branch (where the detector lives) and add band-limiting to the onset detector.

BEST (cov>=80%): ratio 2.6x @ band=1000-4000 k=3.5 cov=34/36

#### 666. assistant (2026-06-07T03:52:02.523Z)

Important ? and honest ? \*\*the band-pass didn't help.\*\* Restricting to the HF "shuttle click" band gave \*lower\* discrimination (1.7?1.9x) than full-band, and the marginally-best was actually the \*low\* (voice) band (2.6x @ k=3.5). So on this GoPro audio, shuttle hits have \*\*no spectral signature a band-pass can exploit\*\* ? the dead-time noise has similar transient energy across all bands. `k` (threshold) is the only real lever, and it trades coverage for discrimination (~3x costs half the rallies).

Before I conclude, let me test the leading suspect: are the silver labels' "dead time" regions actually full of \*warm-up/knock-up\* activity (which would unfairly depress the ratio)? And confirm the null result isn't Adarsh-specific.

#### 667. user (2026-06-07T03:52:17.846Z)

Adarsh and Vasanth.MP4 (k=3.5, band=None): 486 hits, dur=676s, 36 rallies

```
IN-RALLY : 1.27 hits/s (193 over 152s)
MID-MATCH DEAD: 0.58 hits/s (242 over 418s) <- the fair dead-time
PRE-match : 0.32 hits/s (5 over 16s) <- warm-up?
POST-match : 0.51 hits/s (46 over 91s)
==> FAIR discrimination (in-rally vs MID-MATCH dead): 2.2x
```

TestLargeVideo.MP4 (k=3.5, band=None): 94 hits, dur=101s, 7 rallies

```
IN-RALLY : 1.48 hits/s (51 over 34s)
MID-MATCH DEAD: 0.65 hits/s (37 over 56s) <- the fair dead-time
PRE-match : 0.47 hits/s (4 over 8s) <- warm-up?
POST-match : 1.62 hits/s (2 over 1s)
==> FAIR discrimination (in-rally vs MID-MATCH dead): 2.3x
```

#### 668. assistant (2026-06-07T03:53:16.082Z)

The warm-up theory is **disproven** ? the \*mid-match\* dead time (between rallies, the fair comparison) still runs **0.58?0.65 hits/s vs 1.27?1.48 in-rally ? ~2.2x on both videos.** So the ceiling is real, not a label artifact: between-point activity (the loser tossing the shuttle back, footwork, talk) makes transients a classical onset detector can't tell from rally hits.

That's a clean, decisive Option-A result. Let me lock it in: add a band test, document the negative finding in the plan, run the suite, and commit to PR #35.

#### 669. user (2026-06-07T03:53:20.480Z)

<tool\_use\_error>File has not been read yet. Read it first before writing to it.</tool\_use\_error>

#### 670. user (2026-06-07T03:53:26.338Z)

```
38 assert len(m) == len(env) == len(s)
39 assert np.allclose(m, 1.0) and np.allclose(s, 0.0) # constant signal: mean 1,
std 0
40
41
42 def test_onset_envelope_length_aligns_to_frames():
43 x, sr, _ = _synth(dur=2.0)
44 env, hop_sec = hd.onset_envelope(x, sr, frame=1024, hop=256)
45 assert hop_sec == 256 / sr
46 assert len(env) == 1 + (len(x) - 1024) // 256
47
48
49 def test_cluster_hits_drops_lone_keeps_cluster():

The file C:\Users\avidu\Projects\badminton-highlight-indexer\tests\test\_hit\_detector.py has been updated successfully. (file state is current in your context ? no need to Read it back)

#### 672. assistant (2026-06-07T03:53:46.983Z)

Now document the E1 findings in the plan (negative band-pass result + the real ceiling). Let me read the plan's tail to append.

#### 673. user (2026-06-07T03:53:47.704Z)

```
84 pose + ? ? rallies), fine-tuned on our golden corpus instead of depending on WASB's
pretrained weights ? the
```

```
85 intended destination once the corpus is healthy. The modular cues here are how we earn
it (each one cheap,
86 debuggable, and a generator of the labels Option B needs). Full rationale: ADR-007
"Integration architecture".
87
88 ## 9. Success criteria
89 - **E1:** audio hit-clusters recover a meaningful share of WASB-missed golden rallies on
real GoPro audio
90 (recall lift), with hit-clusters aligning to true rallies. Pass ? proceed; fail ?
defer audio, revisit mic/setup.
91 - **E3:** the fused model's held-out (LOVO) F1 beats both the WASB-only baseline and the
trajectory-only
92 distilled student.
93
```

#### 674. user (2026-06-07T03:54:10.155Z)

Switched to branch 'master'

**master...origin/master**

=== open PRs ===

```
35 feat(audio): shuttle-hit detector + E1 go/no-go probe (ADR-007) feat/audio-hit-
detector-e1 OPEN 2026-06-07T03:19:40Z
```

#### 682. assistant (2026-06-07T03:56:20.015Z)

Welcome back ? hope the morning was good. ? Here's the holistic look at Option A.

## Bottom line: classical-onset audio underdelivers on real GoPro audio ? band-pass didn't rescue it

I ran the band-pass, a full **band × sensitivity sweep** (low/mid/high bands × k at 32 kHz), and a **label-artifact check**, on both Adarsh and TestLargeVideo. All committed to **PR #35** (209 tests green); both memory files refreshed.

**What the evidence says:**

- ? **Recall signal is real:** the detector fires in **100%** of rallies and **100%** of WASB-missed rallies have hit-clusters ? audio genuinely lights up where play is.
- ? **Precision ceilings at ~2.2×** (in-rally vs dead-time hit density) on **both** videos ? too low to be a clean cue (audio-only F1 0.13?0.27, below WASB).
- ? **Band-pass made it worse, not better.** The HF "shuttle-click" bands gave **lower** discrimination than full-band ? shuttle hits have no band-separable signature in this audio.
- ? **Not a warm-up/label artifact.** The **mid-match** dead time (between rallies) alone runs ~0.6 hits/s vs ~1.3 in-rally ? the 2.2× holds. **Root cause:** between-point activity ? the loser tossing the shuttle back (literally the false-fire we're fighting), footwork, talk ? makes transients a classical onset detector can't tell from rally hits.

**Honest reflection:** the research ranked audio #1, but on **your** GoPro audio it's weaker than the (broadcast/tennis) literature implied ? exactly the shuttle-SNR + amateur-vs-broadcast caveat the research flagged. The good news is the **E1 gate** did its job: ~30 min of probing saved us from building the whole audio-fusion stack on a cue that wouldn't have carried it.

## Your call ? where next

- **(A) Don't sink more into classical audio.** Get golden labels flowing (your VLC rating) to unblock the **distilled model + a real LOVO** on ?3 videos, and let's hear your **other** hunch. ? **my honest lean.**
- **(B) Try the one remaining audio lever:** an E2 learned **timbre** classifier (MFCC ? shuttle-thwack vs toss/footstep/voice) ? the only thing that can separate what a band-pass can't. But it **needs labeled hits** (real work; we'd bootstrap from your gold labels), so it's gated on data anyway.
- **(C) Cheap re-confirm:** re-run E1 on your human-gold labels ? though the warm-up check suggests it won't move the ~2.2× much.
- **Pose/stance (#2)** also moves up the priority list now that classical audio capped out.

Nothing else is running; master is clean (only PR #35 open, ready when you want it). No rush ? take the holistic look and tell me which thread to pull. And whenever you've rated a clip or two, that single action unblocks the most valuable next step regardless of which option you pick.

**683. user (2026-06-07T03:56:20.146Z)**

BTW I left some refactoring comments on your PR #35. Feel free to club them into a different PR and I can merge them as is. OR whatever you decide! See you in an hour!

**684. assistant (2026-06-07T03:56:31.880Z)**

Ah, refactoring comments ? let me read them and handle it. Fetching the PR #35 review.

**685. user (2026-06-07T03:56:41.256Z)**

=== PR-level review summaries ===

[avidullu COMMENTED]

[avidullu COMMENTED]

[avidullu COMMENTED] LGTM

=== inline review comments (path:line ? comment) ===

?? backend/eval/audio\_e1\_probe.py:1

Could we make a audio/ directory for the evals separately here as well just like in backend?

?? tests/test\_hit\_detector.py:1

Similarly for tests/ I would like to do a refactor and isolate some components on some metric for lesser fragmentation of files. Feel free to file a TODO in the next steps if that makes the refactoring in a separate PR.

=== issue-style comments ===

**686. assistant (2026-06-07T03:58:13.756Z)**

Two refactor comments (PR is LGTM otherwise):

1. `**audio_e1_probe.py**` ? make a `backend/eval/audio/`` dir mirroring `backend/audio/``.
2. `**tests/**` ? a broader "reduce fragmentation" reorg ? and you explicitly said file a TODO if it's separate-PR-sized.

My call: comment 1 is a tiny move of a *\*brand-new, unmerged\** file, so I'll fold it *\*\*into #35\*\** (cleaner than a stacked PR ? master never sees the old path, avoids the stale-base tangle we hit before). Comment 2 I'll *\*\*file as a TODO\*\** as you offered, since the grouping "metric" is really your design choice. Let me find all references first.

**687. user (2026-06-07T03:58:17.673Z)**

Switched to branch 'feat/audio-hit-detector-e1'

=== #35 still open? ===

OPEN

=== references to audio\_e1\_probe ===

Now file the tests-reorg TODO in BACKLOG.md (comment 2). Let me read it first.

**700. user (2026-06-07T03:59:24.526Z)**

```
1 # Backlog ? deferred items to revisit
2
3 Single tracker for work we consciously deferred, so nothing gets lost between sessions.
Each item records **what**, **why it's deferred**, and **the trigger to revisit**. Every entry
traces to a real decision/PR/doc (no speculative work).
4
5 > Maintained as a version-controlled doc for now. Say the word and I'll mirror any/all
of these to **GitHub issues** instead (or in addition).
6 > Status legend: ? blocks something · ? do when triggered · ? nice-to-have/cleanup.
7
8 _Last updated: 2026-05-30._
9
10 ---
11
12 ## Monetization / licensing
13 *(source: `docs/MONETIZATION_AUDIT.md` §7, ADR-005)*
14
15 - ? **Ultralytics Enterprise pricing** ? get a quote **only if** the
torchvision/ByteTrack detector (PR #8) proves insufficient on real footage. Currently *not
needed* (swap done). Quote-only pricing. **Revisit:** if detector quality forces reconsidering
YOLOv8.
16 - ? **Codec patent thresholds (AVC/HEVC/AAC)** ? confirm exact Via-LA (AVC) / Access
Advance (HEVC) royalty rates & free thresholds **with legal counsel** before relying on the
"small SaaS is under threshold" reading. Mitigation already chosen: emit royalty-free AV1/Opus
output. **Revisit:** before commercial launch.
17 - ? **Per-checkpoint weight/dataset licenses** ? if we borrow pretrained weights (YOLOX,
ActionFormer, WASB, TrackNetV3), the *code* license ? the distributed *weights/dataset* terms.
Either train our own or confirm each checkpoint. **Revisit:** when adopting any borrowed
weights.
```

18 - ? **Real GPU \$/video & latency** ? benchmark the three LLM-step options (offline ActionFormer vs self-hosted Qwen2.5-VL-7B vs Gemini paid-tier) on the target VM before pricing the product. **Revisit:** when choosing the production LLM step.

19

20 ## Detector swap follow-ups

21 \*(source: PR #8, ADR-005)\*

22

23 - ? **supervision` ByteTrack deprecation** ? `sv.ByteTrack` is deprecated as of supervision 0.28.0 and **removed in 0.30.0**; `requirements.txt` is pinned `<0.30.0` as a stopgap. Migrate to `ByteTrackTracker` from the separate `trackers` package before lifting the cap. **Revisit:** before bumping supervision past 0.30.

24 - ? **Real-video validation of the swap** ? the torchvision + ByteTrack Stage-1 is unit-tested with mocks but **not yet validated on actual footage** for detection/tracking quality. (ADR-004 separately found player pixel-motion is a weak rally proxy on broadcast video, so expect tuning.) **Revisit:** when a real test clip + the pipeline are run together.

25 - ? **yolo\_hybrid` naming** ? the registry key, `yolo\_` config keys, and `yolo-hybrid-` DB detector tags keep the "yolo" name for back-compat despite no YOLO remaining. Optional rename. **Revisit:** if/when a clean break is worth the migration.

26

27 ## Golden-set subproject

28 \*(source: `docs/GOLDEN\_SET\_IMPLEMENTATION.md`, `docs/GOLDEN\_SET\_VENDORING.md`)\*

29

30 - ? **Annotation guideline** ? **DONE (2026-06-02):** authored as the Roora brief + illustrated guide in the collector repo `docs/annotation/` ? rally CSV schema; ignore dead time / include every rally (incl. faults & lets) / shot = one contact; `ending\_reason` (forced/unforced-error taxonomy, shared across net-separated sports); singles & doubles for badminton & pickleball.

31 - ? **Internal gold key** ? hand-annotate 5?10 licensed clips to near-perfect as the vendor answer key. **Unblocked.** **Revisit:** anytime.

32 - ? **GS-3 ? HumanVendorProvider** ? concrete adapter for the chosen annotation vendor (submit/poll/fetch + DPA/secure-link controls). **Vendor selected for the initial pilot: Roora** (Bengaluru; iMerit / Taskmonk / TELUS remain the fallback shortlist). **Revisit:** once the Roora pilot confirms quality, then build the adapter.

33 - ? **GS-4 oracle model** ? `AutomatedProvider` interface is stubbed (this work) with a deterministic fake. Wire a **concrete** fast-tier auto-labeler later. **Oracle rule:** it **MUST** be a different model lineage than production, or the regression test is blind to shared failures. **Revisit:** when a production LLM step is chosen (pick the oracle's lineage to differ).

34 - ? **GS-5 ? regression triggers** ? wire `regress()` into CI (pre-merge gate), on-demand CLI (the "surprise" case), and a scheduled run; include a deliberate re-baseline path. **Revisit:** after GS-4.

35 - ? **Vendor pilot (Roora)** ? run the paid pilot with **Roora** as a **single-vendor pilot first** (not a multi-vendor bake-off): assess quality-per-rupee against the \$4 bar; escalate to the iMerit/Taskmonk fallback only if it misses. **Revisit:** the pilot doubles as calibration once the gold key exists.

36 - ? **Phase-1 video collection** ? gather the round-1 golden corpus per `docs/GOLDEN\_SET\_PHASE1\_VIDEOS.md`: **static self-recorded** footage (mirror deployment, not broadcast), 3 sports incl. singles & doubles, across the diversity matrix; ~12 clips/sport with **? held out by match**. **Unblocked.**

37 - ? **Train/eval separation guardrails** ? train & eval videos live in **separate catalogs** today, kept apart by convention only. Add **hard guardrails** (permissions / explicit approval / re-confirmation at ingest & export) so a video can **never** land in both train and eval. **Revisit:** dedicated design session with the user.

38

39 ## Recording best practices

40 \*(source: `docs/VIDEO\_RECORDING\_GUIDELINES.md`)\*

41

42 - ? **Validate recording hypotheses** ? empirically test which capture conditions (resolution, fps, camera angle/height, lighting) actually move precision/recall, then promote the winners into user-facing "how to record" guidance. Only the static-camera rule is currently evidence-backed (ADR-004). **Revisit:** once a controlled corpus + the eval loop can measure per-condition deltas.

43

Adding the tests-reorg TODO to BACKLOG (comment 2) + bumping the date:

PR comment posted, on master, clean. Quick memory note per the auto-checkpoint policy:

**710. assistant (2026-06-07T04:01:19.570Z)**

Both review comments handled ? welcome back whenever you land. ?

```
PR #35 (still open, now a single complete PR ready to merge as-is):
- **Comment 1 ? `eval/audio/` dir ?:** moved `backend/eval/audio_e1_probe.py` ?
`backend/eval/audio/e1_probe.py` (+ `__init__.py`), mirroring `backend/audio/`. Updated the
test import and the plan-doc reference. I **folded it into #35** rather than a separate PR ?
it's a brand-new, *unmerged* file, so moving it in place keeps master from ever seeing the old
path and dodges the stacked-PR / stale-base mess we hit a couple times. (That's my read of your
"whatever you decide" ? trivially splittable if you'd rather.)
- **Comment 2 ? `tests/` de-fragmentation ?:** filed as a dedicated-PR **TODO in
```

`docs/BACKLOG.md`\*\* (new "Code & test organization" section). I deliberately didn't guess the grouping ? the \*metric\* (consolidate small files vs. per-area dirs like `tests/audio/`, and "less fragmentation" slightly tensions with adding dirs) is your design call. Point me at the scheme and I'll execute it as its own PR.

**\*\*209 tests green\*\*** after the move; I left a reply on the PR summarizing this; memory refreshed per the auto-checkpoint policy.

So: merge #35 when ready and the eval/audio/ structure comes with it. The tests reorg is queued in BACKLOG awaiting your grouping preference. No other open threads ? and the bigger audio verdict (classical onset caps ~2.2x; decide between an E2 timbre classifier vs. re-prioritizing to stance / your "other hunch" / more golden data) is still yours to call whenever you've had the holistic look.

#### 711. user (2026-06-07T04:46:39.266Z)

PR is merged. Can you summarize the audio work quantitatively i.e. maybe we should clearly document the gains and losses from it and record it so that we avoid them when we add more such signals or in the longer term plan. You are running at 95% context window with ~950K tokens, so I think you need "a break" :) .. Can you clearly update all the handoffs, current states, next step etc. and prepare to sunset this session and so that your next incarnation picks up and we can resume to my audio classifier or golden evals. Thanks for the amazing work and diligent discoveries, your research will be very useful in the next session!

#### 712. assistant (2026-06-07T04:48:01.771Z)

PR #35 merged ? and yes, I'll take that break after a clean wrap. ? Let me (1) sync + prune, (2) write a durable quantitative audio findings + lessons doc, (3) fully refresh handoff/current-state/next-steps for the next incarnation. No new heavy work ? pure consolidation.

#### 713. user (2026-06-07T04:48:12.329Z)

#### 714. assistant (2026-06-07T04:48:35.933Z)

Clean: master has the audio code, branch pruned, no open PRs. Now the durable quantitative findings + lessons doc.

#### 715. assistant (2026-06-07T04:48:49.132Z)

## Audio cue (E1) ? quantitative findings & reusable lessons

**\*\*Date:\*\*** 2026-06-07 · **\*\*Status:\*\*** decision recorded (classical-onset audio NOT adopted for fusion).  
Companion to ADR-007 and `AUDIO\_RALLY\_DETECTION\_PLAN.md` §10. Purpose: record the **\*\*gains and losses quantitatively\*\*** so we don't repeat the dead ends when adding the next signal (pose/stance, etc.) or when building the Option-B end-to-end model.

TL;DR

On real GoPro badminton audio, a classical onset hit-detector has a **strong recall signal** but a precision ceiling of  $\sim 2.2\times$  ? too weak to be a clean rally cue. **Band-pass filtering did not help.**

Net: keep the cheap, tested detector; **do not build audio fusion on the classical onset cue**; the only path past  $\sim 2.2\times$  is a **learned timbre classifier** (E2), which needs labels. The E1 gate returned this verdict **before** any fusion was built ? a few hours, no wasted downstream work.

## Quantitative scorecard (existing GoPro audio vs Gemini **silver** labels)

**GAINS ? what audio gave us:**

Signal	Adarsh (36 rallies, 676 s)	TestLargeVideo (7 rallies, 101 s)
Rally coverage (rallies with ?2 detected hits)	<b>100%</b> (36/36)	<b>100%</b> (7/7)
WASB-missed rallies that contain an audio hit-cluster (recall-recovery)	<b>100%</b> (14/14)	<b>100%</b> (5/5)
Hits detected (@k=3.5)	486	94

**LOSSES / LIMITS:**

Metric	Adarsh	TestLargeVideo
Discrimination = in-rally $\div$ dead-time hit density (fair, mid-match)	$\sim 2.2\times$	$\sim 2.3\times$
?at k=2.5 / best-coverage k=4	1.3 $\times$ / 2.8 $\times$ (coverage drops to 30/36)	1.5 $\times$
Audio- <b>only</b> proposal F1 (P / R)	<b>0.27</b> (0.22 / 0.36)	<b>0.13</b>
WASB-only F1 (reference baseline)	0.54	0.33
Band-pass effect on discrimination	<b>none / negative</b> (HF bands <b>worse</b> )	?
Sensitivity cliff   k=6 ? $\sim 0$ hits (43 ? 0.6 hits/min)	?	?

**What we built/ran (cost):** ``backend/audio/hit_detector.py`` (ffmpeg?numpy spectral-flux onset?adaptive peak, no scipy) + ``backend/eval/audio/e1_probe.py`` + band $\times$  sweep + warm-up/label-artifact check.  $\sim 209$  tests; one session; **no fusion built** (gated correctly).

## Root cause of the ceiling

Between-point activity ? the **loser tossing the shuttle back** (literally our false-fire), footwork, and talk ? produces transients a classical onset detector cannot distinguish from rally hits. The signal is **band-agnostic** (HF "shuttle-click" bands gave **lower** discrimination, not higher), so the separation problem is **timbre**, not frequency band ? a filter can't fix it; a learned classifier might.

## Caveats on the numbers

- Labels are **Gemini silver**, not human-gold ? dead-time may include unlabeled activity, so  $\sim 2.2\times$  is a plausible **floor**. But the warm-up check (mid-match dead-time **alone** is  $\sim 0.6$  hits/s vs  $\sim 1.3$  in-rally on both clips) says human-gold is unlikely to move it much.
- Only **2 videos**, 1 GoPro setup. Re-confirm on human-gold when available.

## Generalizable lessons ? apply to the NEXT cue (pose/stance) and Option B

- Gate before build.** A cheap probe on **real target data** against **existing** labels gave a decisive go/no-go before any fusion code. Make every new signal earn an E1-style probe first.
- Test on the real distribution, not the literature.** The research ranked audio #1 (from broadcast/tennis); on amateur GoPro badminton it underdelivered ? the exact SNR/domain caveat the research flagged. Lit rankings are hypotheses; the probe is ground truth.
- Discrimination ratio** (in-class  $\div$  out-of-class signal density) is a fast, label-light cue-

quality screen.\*\*

Compute it first. Rule of thumb from this run: \*\*>2x to be worth fusing; ~2x = weak.\*\*

4. \*\*Separate the recall role from the precision role.\*\* Audio was excellent at recall (100% coverage) and poor

at precision ? a cue can be one and not the other. Decide its job before fusing.

5. \*\*Band ? timbre.\*\* Frequency band-passing can't separate same-band, different-timbre sounds. If discrimination

is band-agnostic, the lever is a learned timbre model, not a filter.

6. \*\*Silver for the gate, gold for the verdict.\*\* Gemini silver labels were enough to reach go/no-go cheaply;

reserve scarce human-gold for confirmation.

7. \*\*Keep the cheap knob, record the negative.\*\* We kept the `band=` param (may help other mics/human-gold) but

documented it didn't help here, so we don't re-explore it.

8. \*\*The recurring blocker is golden labels, not cleverness.\*\* Past ~2.2x needs a learned classifier (labels) ?

echoing the distilled-model finding (n=2 too few). Across cues, \*more golden labels\* is the highest-leverage move.

## Decision recorded

- \*\*Classical-onset audio: NOT adopted for fusion now.\*\* Detector + E1 probe kept (merged, tested).

- \*\*Next audio step:\*\* E2 learned \*\*timbre\*\* classifier \*iff\* labels make it cheap; else re-prioritize.

- \*\*Sequenced behind golden-label generation\*\* (owner self-rating via the VLC annotator). The next session resumes

on either the \*\*E2 audio classifier\*\* or \*\*golden evals\*\* (owner's pick).

Committing the findings doc as a small docs PR:

## 718. user (2026-06-07T04:49:31.168Z)

Switched to a new branch 'docs/audio-e1-findings'

warning: in the working copy of 'docs/AUDIO\_E1\_FINDINGS.md', LF will be replaced by CRLF the next time Git touches it

To <https://github.com/avidullu/badminton-highlight-indexer.git>

\* [new branch] docs/audio-e1-findings -> docs/audio-e1-findings

/usr/bin/bash: line 42: AUDIO\_RALLY\_DETECTION\_PLAN.md: command not found

<https://github.com/avidullu/badminton-highlight-indexer/pull/36>

Switched to branch 'master'

## 719. assistant (2026-06-07T04:49:35.057Z)

API Error: Server is temporarily limiting requests (not your usage limit) · Rate limited

## 720. user (2026-06-07T04:56:42.113Z)

PR is merged. Can you summarize the audio work quantitatively i.e. maybe we should clearly document the gains and losses from it and record it so that we avoid them when we add more such signals or in the longer term plan. You are running at 95% context window with ~950K tokens, so I think you need "a break" :) .. Can you clearly update all the handoffs, current states, next step etc. and prepare to sunset this session and so that your next incarnation picks up and we can resume to my audio classifier or golden evals. Thanks for the amazing work and diligent discoveries, your research will be very useful in the next session!

#### 721. assistant (2026-06-07T04:56:59.940Z)

PR #36 merged ? the quantitative findings doc is now on master. Let me sync, prune, and then do the full sunset refresh of memory.

#### 722. user (2026-06-07T04:57:08.243Z)

Already on 'master'

Already up to date.

=== findings doc on master? ===

ls: cannot access 'docs/AUDIO\_E1\_FINDINGS.md': No such file or directory

Deleted branch docs/audio-e1-findings (was f643d64).

=== tree ===

**master...origin/master**

#### 723. assistant (2026-06-07T04:57:37.411Z)

Wait ? red flag: **\*\*the findings doc is NOT on master\*\***, `pull` says up-to-date, and no PRs are open ? yet I just deleted the `docs/audio-e1-findings` branch. That's the same "delete-before-confirming-merge" trap that stranded files earlier. Let me check PR #36's real state and make sure the doc isn't lost.

#### 724. user (2026-06-07T04:57:41.042Z)

=== PR #36 state ===

{"headRefName":"docs/audio-e1-findings","mergedAt":null,"state":"CLOSED"}

=== is the findings commit f643d64 still recoverable? ===

commit

### Audio cue (E1) ? quantitative findings & reusable lessons

**\*\*Date:\*\*** 2026-06-07 . **\*\*Status:\*\*** decision recorded (classical-onset audio NOT adopted for fusion).

=== master log top ===

64ccc50 feat(audio): shuttle-hit detector + E1 go/no-go probe (ADR-007) (#35)

53f6ae9 docs: expand ADR-007 fusion architecture (Option A now, Option B later) (#34)

59e813d chore: remove vendored VLC annotator (lives in its own repo now) (#33)

#### 725. assistant (2026-06-07T04:58:42.721Z)

Diagnosis: **\*\*PR #36 is CLOSED, not merged\*\*** (the "PR is merged" was the duplicate message referring to #35). So the dedicated findings doc never reached master ? and I'd deleted its branch. Good news: **\*\*the commit (`f643d64`) is intact and the doc is fully recoverable\*\*** (and it's in my context). Nothing's lost.

Given you're sunsetting and closed that PR, the most robust home for this record is **\*\*memory\*\*** (what the next incarnation reads first) ? not a repo file the PR was closed on. Writing the quantitative findings + lessons there now.

#### 726. assistant (2026-06-07T04:59:02.434Z)

---

name: audio-e1-findings

description: "Quantitative gains/losses of the audio (E1) cue + reusable lessons for adding the NEXT signal. Classical-onset audio NOT adopted; detector kept."

metadata:

node\_type: memory

type: project

---

Durable record of the audio experiment (2026-06-07). Core numbers also in  
`docs/AUDIO\_RALLY\_DETECTION\_PLAN.md` §10 (on master via PR #35). The fuller dedicated doc  
`docs/AUDIO\_E1\_FINDINGS.md` was written but its **\*\*PR #36 was CLOSED (not merged)\*\*** ? NOT on  
master  
(commit f643d64 recoverable). This memory note is the authoritative cross-session record.

## Verdict

Classical-onset audio hit-detection on real GoPro badminton audio: **\*\*strong recall signal, precision ceiling**  
~2.2× ? too weak as a clean cue. **\*\*Band-pass did NOT help. Detector + E1 probe KEPT (merged, tested, PR #35);**  
**\*\*no audio fusion built\*\*** (E1 gate returned the verdict first). Next audio step = E2 learned **\*\*timbre\*\*** classifier  
(needs labels) IF cheap; else re-prioritize.

## Scorecard (existing GoPro audio vs Gemini SILVER labels; Adarsh=36 rallies/676s, TestLarge=7/101s)

GAINS: rally coverage (?2 hits) **\*\*100%\*\*** both; WASB-missed rallies with an audio hit-cluster (recall-recovery)  
**\*\*100%\*\*** both (Adarsh 14/14, TestLarge 5/5).  
LOSSES: discrimination (in-rally ÷ mid-match dead-time hit density) **\*\*~2.2× / ~2.3×\*\*** (1.3× @k2.5; 2.8× @k4 but coverage drops to 30/36; cliff at k6?~0 hits). Audio-only proposal **\*\*F1 0.27 (Adarsh) / 0.13 (TestLarge)\*\*** vs  
WASB-only 0.54 / 0.33. **\*\*Band-pass: none/negative\*\*** (HF "shuttle-click" bands gave LOWER discrimination).  
ROOT CAUSE: between-point activity (loser tossing shuttle back = our false-fire, footwork, talk) = transients a  
classical onset detector can't separate. Band-agnostic ? a **\*\*timbre\*\*** problem, not a band problem.  
CAVEAT: silver labels (floor, not ceiling); warm-up check shows it's not a pre-match artifact (mid-match dead  
alone ~0.6 vs ~1.3 in-rally) so human-gold unlikely to move it much. n=2 videos, 1 GoPro.

## Reusable LESSONS (apply to pose/stance #2 and Option B)

1. **\*\*Gate before build\*\*** ? a cheap probe on real target data + existing labels gave a decisive go/no-go before any fusion. Every new cue earns an E1-style probe first.
2. **\*\*Test on the real distribution, not the literature\*\*** ? research ranked audio #1 (broadcast/tennis); on amateur GoPro badminton it underdelivered (the SNR/domain caveat). Lit = hypothesis; probe = truth.
3. **\*\*Discrimination ratio (in-class ÷ out-of-class density) = fast label-light cue screen.\*\*** >>2× to fuse; ~2× weak.
4. **\*\*Separate recall-role vs precision-role\*\*** ? a cue can be great at one, useless at the other.
5. **\*\*Band ? timbre\*\*** ? band-pass can't split same-band different-timbre sounds; if discrimination is band-agnostic, the lever is a learned classifier, not a filter.
6. **\*\*Silver labels for the gate, gold for the verdict.\*\***
7. **\*\*Keep the cheap knob, record the negative\*\*** (kept `band=` param; documented it doesn't help so we don't re-try).
8. **\*\*The recurring blocker is golden labels, not cleverness\*\*** (past ~2.2× needs a learned model; echoes distilled model n=2 too few). More golden labels = highest-leverage move across all cues.

## Code (on master, PR #35)

`backend/audio/hit\_detector.py` (ffmpeg?numpy spectral-flux onset?adaptive peak + `band` knob; no scipy),  
`backend/eval/audio/e1\_probe.py` (E1 diagnostic). 7 hit-detector tests; suite 209 green.

## 732. assistant (2026-06-07T04:59:44.281Z)

Now the sunset checkpoint in `current-state` and the handoff refresh. Reading the current

headers.

### 733. user (2026-06-07T04:59:44.974Z)

```
10 # Current state ? updated continuously (see [[working-agreement-checkpoints]])
11
12 **Checkpoint:** 2026-06-07 · CLEAN SLATE. Indexer PRs #25?#32 MERGED; master 202 tests
green, tree clean, branches pruned
13 (kept feat/khelacharya-shot-intelligence). Audio decided (ADR-007). VLC annotator ?
standalone public repo
```

### 734. user (2026-06-07T05:00:00.459Z)

The file C:\Users\avidu\claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md has been updated successfully. (file state is current in your context ? no need to Read it back)

### 735. assistant (2026-06-07T05:00:19.737Z)

Refreshing the handoff for sunset ? reading it to edit precisely.

### 736. user (2026-06-07T05:00:20.589Z)

```
16 Pointer, not a duplicate. **For the freshest blow-by-blow state, read [[current-state]]
first**
17 (updated every micro-checkpoint); this handoff is the slower ~1-page orientation.
18
19 ## You are here (2026-06-07)
20 - **Rally-detection stack matured & all merged.** WASB shuttle-trajectory substrate is
**resumable/
21 checkpointed** (md5-ish cache, incremental detector flush, tracker re-run). On top: a
rally layer =
22 windowing thresholds + a **net-crossing "gate A"** + a **distilled classifier**
(`distill_local`).
23 Eval harness: `calibrate_wasb` / `calibration.py` (LOVO) / `metrics.py`.
24 - **Honest core finding:** WASB-only threshold tuning **ceilings ~F1 0.44** and the
learned distilled
25 model **underperforms the baseline at n=2 videos**. The blocker is **golden data +
WASB candidate
26 recall**, not the method. (Gemini-as-teacher gave us the first real measurement.)
27 - **Strategy decided (ADR-007):** Gemini = **offline teacher only**; **AUDIO** hit-
detection is the next
28 local cue, **fused in our rally layer** (WASB stays a frozen black box) ? Option A.
**Pose/stance =
29 parked #2.** **Option B = the eventual end-state**: one OWNED end-to-end multimodal
model
30 (frames+audio+pose?rallies) fine-tuned on our data, dropping WASB-weight dependence +
the recall ceiling.
31 - **Golden data path:** owner **self-rates** clips with the new **standalone VLC
annotator repo**
32 (github.com/avidullu/rally-annotator, MIT, multi-sport) ? CSV ? in-repo `--labels`
loaders / collector
33 `import-local`. Human labels > the Gemini silver labels the model was starving on.
34 - **Both repos clean.** Indexer: PRs #25?#34 merged, master green (202 tests), tree
clean. Annotator:
35 public, `main` clean. Modeling is **PARKED** pending golden labels.
36
37 ## Next steps / open threads
```

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\session-handoff.md has been updated successfully. (file state is current in your context ? no need to Read it back)

739. assistant (2026-06-07T05:01:20.115Z)

Everything's consolidated and the next incarnation is set up. Here's the sunset wrap.

## ? Audio work ? quantitative summary (gains & losses)

Recorded durably in **memory** ([[audio-e1-findings]])\*\* + **docs/AUDIO\_RALLY\_DETECTION\_PLAN.md** §10\*\* (on master).

### **\*\*GAINS\*\***

Adarsh (36 rallies)   TestLargeVideo (7)
--- --- ---
Rally coverage (?2 hits)   100%   100%
Recall-recovery of WASB-missed rallies   100% (14/14)   100% (5/5)

### **\*\*LOSSES / LIMITS\*\***

Adarsh   TestLargeVideo
--- --- ---
Discrimination (in-rally ÷ dead-time)   ~2.2×   ~2.3×
Audio-only F1 (vs WASB-only)   0.27 (vs 0.54)   0.13 (vs 0.33)
Band-pass effect   none/negative   ?

**\*\*Verdict:\*\*** classical-onset audio is too weak to be a clean cue; band-pass can't fix it (it's a \*timbre\*, not a frequency-band, problem ? between-point shuttle-tosses/footwork/talk fool the detector). Detector kept (merged, tested); **\*\*no fusion built\*\*** ? the E1 gate paid for itself.

**\*\*The reusable lessons\*\*** (the real value, in [[audio-e1-findings]]): gate-before-build · test on the *\*real\** distribution not the literature · discrimination-ratio is a fast cue screen (want ?2×) · band ? timbre · silver labels for the gate / gold for the verdict · **\*\*golden labels** are the recurring blocker across every cue\*\*.

## ? Repo state

master clean ? **\*\*PRs #25?#35 merged\*\***, 209 tests green, no open PRs, only ``feat/khelacharya-shot-intelligence`` retained.

**\*\*One honest flag:\*\*** PR **\*\*#36\*\*** (the *\*dedicated\** ``docs/AUDIO_E1_FINDINGS.md``) was **\*\*closed**, not merged\*\*, and I'd deleted its branch (the delete-before-confirming trap again ? caught it). The doc isn't lost: commit ``f643d64`` is recoverable, and the full record is safe in memory + plan §10. If you want that dedicated repo doc, next session can re-land it in one step.

## ? Resume plan (in current-state + handoff)

Next incarnation picks up on **\*\*either\*\***:

1. **\*\*Golden evals\*\*** ? you rate clips in the VLC annotator ? ``import-local`/`--labels`` ? unblocks the distilled-model LOVO (n?3) + human-gold E1 re-confirm. *\*Highest-leverage.\**
2. **\*\*Audio E2\*\*** ? learned *\*timbre\** classifier (needs labeled hits).

Also queued: pose/stance #2, your "other hunch", Option B (owned end-to-end model). Ramp-up kit (CODE\_MAP, research, ADR-007, audio findings) is all linked.

**\*\*Memory fully refreshed\*\*** for sunset ? current-state, session-handoff, the new audio-findings note, and the index all point a fresh session straight at the resume options.

This was a genuinely fun, productive run ? WASB checkpointing, the distilled model, the Gemini teacher experiments, the rally-annotator release, and an honest audio go/no-go that saved us real build time. Thank you for the trust and the great instincts (the stance hunch, the local-first conviction, keeping me honest on the labels). Go rate some rallies ? I'll be ready to dive into the audio classifier or the golden evals next time. ??

#### 740. user (2026-06-07T05:09:11.462Z)

Great! BTW As humanly stupid I can be I mistakenly closed that PR instead of merging it. I have restored that branch on github if that helps and can you just resend that PR and record it? My apologies

#### 741. assistant (2026-06-07T05:09:37.109Z)

No apology needed at all ? closing instead of merging is the easiest slip in the world, and restoring the branch was exactly the right move. That makes this trivial: I'll just reopen #36 (cleaner than a new PR ? keeps the history and my review reply). Let me verify the restored branch and reopen.

#### 742. user (2026-06-07T05:09:44.199Z)

### Audio cue (E1) ? quantitative findings & reusable lessons

=== reopen PR #36 ===

? Reopened pull request avidullu/badminton-highlight-indexer#36 (docs: quantitative audio (E1) findings + reusable lessons)

#### 743. assistant (2026-06-07T05:10:14.116Z)

PR #36 reopened, branch intact at `f643d64` with the findings doc. Let me confirm it's cleanly mergeable and check the body wasn't mangled by that earlier shell hiccup.

#### 744. user (2026-06-07T05:10:16.634Z)

state=OPEN mergeable=MERGEABLE status=CLEAN

--- body ---

Durable record (owner request) of the audio experiment's **gains and losses, quantitatively**, plus generalizable lessons so we don't repeat dead-ends on the next signal.

- Scorecard: recall coverage **100%** + recall-recovery **100%**, but discrimination **~2.2x**, audio-only F1 **0.13±0.27** (< WASB 0.33±0.54), band-pass **null**.

- Root cause: between-point activity = transients a classical onset detector can't separate (timbre, not band).

- Lessons for the next cue (pose/stance) + Option B: gate-before-build, test-on-real-distribution-not-literature, discrimination-ratio screen (>2x), band?timbre, silver-for-gate/gold-for-verdict, golden-labels-are-the-recurring-blocker.

Docs only. Companion to ADR-007 + §10.

#### 745. assistant (2026-06-07T05:10:52.299Z)

PR #36: **OPEN, MERGEABLE, CLEAN.** Body's intact (just lost the `AUDIO\_RALLY\_DETECTION\_PLAN.md` filename in the footer from that earlier shell hiccup ? cosmetic). Since you asked me to "resend and record it," I'll merge it now (squash, like the others) to land the record on master.

**master...origin/master**

**747. user (2026-06-07T05:11:19.722Z)**

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\audio-e1-findings.md has been updated successfully. (file state is current in your context ? no need to Read it back)

**748. assistant (2026-06-07T05:11:15.432Z)**

Merged ? **\*\*`docs/AUDIO\_E1\_FINDINGS.md` is on master now\*\*** (73 lines), branch cleaned up, no open PRs, master clean. Let me flip the "#36 closed" caveats in memory to "merged."

**749. user (2026-06-07T05:11:29.013Z)**

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\current-state.md has been updated successfully. (file state is current in your context ? no need to Read it back)

**750. user (2026-06-07T05:11:38.115Z)**

The file C:\Users\avidu\.claude\projects\C--Users-avidu-Projects-badminton-highlight-indexer\memory\session-handoff.md has been updated successfully. (file state is current in your context ? no need to Read it back)

**751. assistant (2026-06-07T05:12:05.134Z)**

All sorted ? no harm done. ?

- **\*\*Reopened your restored #36\*\*, confirmed CLEAN/MERGEABLE, **\*\*squash-merged\*\*** it ?**  
**`docs/AUDIO\_E1\_FINDINGS.md` is now on master (73 lines), branch auto-deleted.**
- Flipped the "#36 closed" caveats in **`current-state`**, **`session-handoff`**, and the **`audio-e1-findings`** memory note to **\*\*\*merged\*\***."

**\*\*Final state ? genuinely clean for sunset:\*\***

- master clean & synced, **\*\*PRs #25?#36 all merged\*\***, **\*\*no open PRs\*\***, only **`feat/khelacharya-shot-intelligence`** retained.
- The quantitative audio record now lives in **\*\*three places\*\***: the in-repo doc (**`docs/AUDIO\_E1\_FINDINGS.md`**), the plan §10, and memory (**[[audio-e1-findings]]**) ? so the next incarnation can't miss it.
- Resume options still teed up: **\*\*golden evals\*\*** (your VLC ratings ? unblocks everything) or **\*\*audio E2\*\*** (timbre classifier).

And truly ? zero apology warranted; a closed-vs-merged misclick is nothing, and restoring the branch was the perfect fix. Thanks again for a great session. Go rate some rallies whenever you're ready ? the next me is fully briefed. ??
