1. user (2026-07-02T06:11:34.061Z)

Hi. How can I use this to work remotely while my machine is active and I am on my mobile

2. assistant (2026-07-02T06:11:34.061Z)

```
[external_agent_tool_call: SendUserMessage]  
input: {"message":"The key thing is that your desktop machine needs to stay on and running with  
Cowork active. Then from your phone:\n\n1. Download the **Claude app** (iOS or Android)\n2. Sign  
in with the same Anthropic account\n3. Go to the **Dispatch tab**\n\nFrom there you can send me  
tasks and I'll execute them on your desktop ? opening files, running code, browsing the web,  
managing apps ? and report back to you in the chat. It's essentially a remote task interface to  
your machine.\n\nThe one limitation is that I can't initiate contact with you; you'd need to  
check the app to see results. But any task you send from mobile will run on your desktop in the  
background."}, {"status":"normal"}  
[/external_agent_tool_call]

"Native Gmail API means I'll constantly patch code when Google changes things" largely isn't true. The Go client you'd call (`google.golang.org/api/gmail/v1`) is **auto-generated** and maintained by Google, and the Gmail API has been v1 with essentially no breaking changes for ~a decade. Token refresh is automatic. When Google adds things, you bump a dependency version ? you don't rewrite anything. So "someone handles updates for me" is **already** mostly true here; that someone is Google, via the client library. The only real one-time cost is OAuth setup (a Cloud project, an OAuth client, clicking past one "unverified app" warning) ? I'll document it, including how to get a long-lived token so you're not re-authing weekly. After that it runs untouched.

The Cowork connector is the **one** option where a third party owns the integration end-to-end, so it's the lowest-maintenance on that single axis. But the cost is coupling: it can't run as the standalone, headless, **scheduled** local binary your DESIGN.md §6 calls for, and it adds a third-party hosted hop to the ingestion path of a tool whose entire threat model is "this is a honeypot ? keep it local." For the core of a privacy-critical bookkeeper meant to outlive any one app, that's a weaker foundation than a stable, owned API.

Either way, the real insurance against churn is **structural**, and I'm building it regardless: the email source goes behind a provider interface, so Gmail-API today / connector or Outlook-Graph tomorrow is a new implementation, not a rewrite. (IMAP is the most protocol-stable option but still needs the same Gmail OAuth **and** loses Gmail's server-side search ? strictly worse here.)

```
[external_agent_tool_call: SendUserMessage]
input: {"message":"The \"Muneem - Opening\" session is an active conversation ? 28 turns in ?
working on a project called **Muneem**, which looks like a local bookkeeper/finance
tool.\n\nIt's currently in a technical design discussion about how to connect to Gmail. The
debate is between using the native Gmail API directly vs. a Cowork connector. The last message
argues for keeping it native (Go client library, Google-maintained), reasoning that the tool is
privacy-critical and designed to run as a headless local binary ? so a third-party hosted
connector doesn't fit the threat model.\n\nIt just asked a follow-up question, so it's waiting
on your input. Want to jump in, or should I fetch more context?","status":"normal"}

[external_agent_tool_result]
Session "Muneem - Opening": running

[assistant] (called mcp_workspace_bash)

[assistant] I've read the full repo: `DESIGN.md`, the Email-Mining prior-art notes, the promo-corpus README, plus `README.md` and `.gitignore`. Quick synthesis before we start.

****Where muneem stands:**** greenfield ? two commits, clean tree, design docs + a 10-PDF non-sensitive promo corpus, zero application code. `DESIGN.md` lays out a five-stage pipeline (ingest ? unlock ? parse ? normalize/store ? analytics) and explicitly parks five decisions for you to make rather than have me guess: language, password sourcing, LLM locality, first-slice scope, and merchant canonicalization.

****One Cowork-specific thing worth flagging up front:**** your Gmail connector is already live in this session, so Stage 1 ingestion could lean on it instead of the native OAuth build-out `DESIGN.md` describes. But the bigger constraint cuts the other way ? your own standing rule says **no sensitive statement contents to a cloud LLM (me) without explicit per-category approval**. That means the one slice I can fully build ****and test end-to-end right now**** is the non-sensitive promo corpus. A real-bank slice would need real statements + passwords + OAuth, none of which I can responsibly process in-session by default.

That reframes the "first slice" question a bit, so let me get your calls on the foundational forks:

[assistant] (called AskUserQuestion)

[assistant] Three decisions locked: ****Go ingest + Python parse****, ****email ingestion as the first slice****, ****native Gmail API OAuth****. That resolves DESIGN.md §8.1, §8.4, and the email-access fork. Since the language call is now made, §9's "don't materialize the layout prematurely" no longer applies ? I can scaffold for real.

I'll build the Stage-1 Go ingestion service: native Gmail OAuth2 (read-only), config-driven financial-doc detection, attachment staging to a gitignored local dir, and `historyId` incremental sync ? compiling and unit-tested with mocked Gmail, plus the Google Cloud setup steps you'll need. The still-parked decisions (password sourcing, LLM locality, merchant canonicalization) aren't on the ingestion path, so I'll leave them alone.

Let me check the toolchain and set up the work plan.

[assistant] (called mcp__workspace__bash)

[assistant] (called TaskCreate)

[assistant] Happy to push back ? and the short version is I'd still keep native, but the assumption driving your concern is mostly off, which changes the math.

"Native Gmail API means I'll constantly patch code when Google changes things" largely isn't true. The Go client you'd call (google.golang.org/api/gmail/v1) is ****auto-generated and maintained by Google****, and the Gmail API has been v1 with essentially no breaking changes for ~a decade. Token refresh is automatic. When Google adds things, you bump a dependency version ? you don't rewrite anything. So "someone handles updates for me" is **already** mostly true here; that someone is Google, via the client library. The only real one-time cost is OAuth setup (a Cloud project, an OAuth client, clicking past one "unverified app" warning) ? I'll document it, including how to get a long-lived token so you're not re-authing weekly. After that it runs untouched.

The Cowork connector is the **one** option where a third party owns the integration end-to-end, so it's the lowest-maintenance on that single axis. But the cost is coupling: it can't run as the standalone, headless, ****scheduled**** local binary your DESIGN.md §6 calls for, and it adds a third-party hosted hop to the ingestion path of a tool whose entire threat model is "this is a honeypot ? keep it local." For the core of a privacy-critical bookkeeper meant to outlive any one app, that's a weaker foundation than a stable, owned API.

Eit?

Should I simply quit Claude on my desktop and restart the app for this deadlock to stop?

50. assistant (2026-07-02T06:11:34.065Z)

```
[external_agent_tool_call: SendUserMessage]
input: {"message":"You don't need to restart the whole app. The cleaner fix is to just open that
\Muneem - Opening\" session directly on your desktop and answer the question it's waiting on ?
that should unblock it immediately.\n\nA full restart would kill the session and you'd lose all
that context (28 turns, decisions locked, tasks created). Not worth it unless it's truly
frozen.\n\nIf you open it on desktop and it looks totally stuck with no pending question
visible, then a restart is reasonable ? but try the session first.", "status":"normal"}
[/external_agent_tool_call]

53. user (2026-07-02T06:11:34.065Z)

Can you please send me a summary of what is going on in my Claude code

54. assistant (2026-07-02T06:11:34.066Z)

```
[external_agent_tool_call: SendUserMessage]
input: {"message":"Here's what's open across your 3 sessions:\n\n**Muneem - Opening** (running,
stuck)\nBuilding a local financial bookkeeper called Muneem. You've locked the key decisions: Go
for ingestion, Python for parsing, native Gmail OAuth for email access. It created 8 tasks and
was about to scaffold the Stage-1 Gmail ingestion service ? but got blocked waiting for your
answer on a question about the Gmail API approach. I've sent your message asking it to document
the implementation strategy first and await your approval before writing any code. It hasn't
responded yet.\n\n**Update README and run tests** ? idle, nothing active.\n\n**Set up Cowork** ?
idle, nothing active.\n\nThe Muneem session is the only one with live work. Open it on your
desktop to unblock it.\n\n", "status":"normal"}

Session "Update README and run tests": idle
```

[assistant] All green ? nice. So to recap this session: the README is updated to reflect the current pluggable-segmenter architecture (yolo_hybrid default, gemini, motion), the real `config.json` schema, the new `--trim-\*` CLI flags, the `run\_process\_and\_stitch.py` entry point, the YOLO hybrid pipeline FAQ, and a Testing + Project Structure section. The test suite under `tests/` passes 26/26.

Want me to also drop in that one-line `pytest.ini` with `testpaths = tests` so plain `pytest` never wanders into `scratch/` again? It's a 5-second add and would have saved us the hang earlier.

```
[user] ===== test session starts
```
