Source Extractor

Research question: "Find promising AND reliable open-source tools/libraries for parsing Indian bank statement PDFs ? especially HDFC Bank savings/transaction statements ? into structured transaction rows (date, narration, ref, value date, withdrawal, deposit, closing balance), for reuse in a LOCAL-FIRST Python personal-finance tool ("muneem").

HARD CONSTRAINTS (a tool that violates these is unusable for us):

1. Must run 100% LOCALLY. Bank statements are highly sensitive ? NO cloud APIs, NO paid SaaS (e.g. bankstatementconverter.com, docparser, LLM extraction APIs). Paid/cloud is not acceptable even as a default.
2. Must be usable from Python.
3. License MUST be permissive & commercially safe: MIT, BSD, Apache-2.0, ISC, HPND. AVOID and explicitly FLAG anything GPL/LGPL/AGPL or that depends on copyleft native components ? in particular Camelot/tabula's reliance on Ghostscript (AGPL) or a Java runtime. PyMuPDF (AGPL) is already banned for us.

Specifically evaluate and compare these table-extraction approaches, for each giving: license (AND license of native deps), maintenance status (latest release + activity as of 2025/2026), reliability on SEMI-RULED / partially-borderless tables (HDFC's transaction table is not fully line-ruled), and password-protected-PDF support:

- pdfplumber (we already use it; MIT)
- Camelot ? camelot-py vs the maintained "pypdf_table_extraction" fork; its Ghostscript/OpenCV deps
- tabula-py (tabula-java + JVM)
- pypdfium2-based table extraction
- any other notable local options

Also assess the user's idea: "convert the PDF table to Excel/CSV first, then parse" ? is an intermediate CSV/Excel extraction more reliable than direct coordinate/text parsing, and which LOCAL+permissive tools do PDF?CSV/Excel table conversion well?

Finally, search for any existing, maintained, permissively-licensed open-source projects specifically for parsing Indian bank statements (HDFC/ICICI/SBI/Axis) or bank statements generally, that we could reuse or learn from (GitHub/PyPI).

Deliver a ranked shortlist of the most promising + reliable + license-safe options for HDFC statement parsing in a local Python tool, each with its license (and native-dep licenses), maintenance status, strengths/weaknesses for this use case, and a concrete recommendation for muneem (reuse library X vs. hand-roll coordinate clustering with pdfplumber). Cite sources."

Fetch and extract key claims from this source:

```
**URL:** https://pypi.org/project/pikepdf/  
**Title:** pikepdf · PyPI (release history / metadata)  
**Found via:** practitioner ? encrypted PDF support search
```

Task

1. Use WebFetch to retrieve the page content.
2. Assess source quality: primary research/institution? secondary reporting? blog/opinion? forum? unreliable?
3. Extract 2-5 FALSIFIABLE claims that bear on the research question. Each claim must:
 - be a concrete, checkable statement (not vague generalities)
 - include a direct quote from the source as support
 - be rated central/supporting/tangential to the research question
4. Note publish date if available.

If the fetch fails or the page is irrelevant/paywalled, return claims: [] and sourceQuality: "unreliable".

Structured output only.

2. assistant (2026-05-30T19:11:51.747Z)

I'll fetch the pikepdf PyPI page to assess its relevance to the research question.

3. user (2026-05-30T19:12:03.870Z)

pikepdf Library Information

1. Software License

****SPDX License:**** MPL-2.0 (Mozilla Public License 2.0)

The page states: "pikepdf is licensed under the Mozilla Public License 2.0 (MPL-2.0) license that can be found in the LICENSE file."

2. Native Dependencies and Their Licenses

****Primary Dependency:**** qpdf (C++ library)

The documentation notes: "pikepdf is based on qpdf, a mature, actively maintained C++ library for PDF manipulation and repair."

The page explains the naming origin: "Python + qpdf = 'py' + 'qpdf' = 'pyqpdf', which looks like a dyslexia test."

The qpdf library's specific license is not explicitly stated on this page, though pikepdf itself carries the permissive MPL-2.0 license.

3. Latest Release

****Version:**** 10.7.2

****Release Date:**** May 25, 2026

The page confirms this is marked as the current stable release (shown with a blue cube icon).

4. Encrypted PDF Support

****Full support confirmed.**** The page states: "Open password-protected PDFs and save with encryption (AES-256, AES-128, or RC4)."

Specific capabilities include:

- Opening encrypted PDFs with passwords
- Saving with encryption using specified user/owner passwords
- Removing encryption when user password is not set
- Note: "Digital signature-based encryption is not currently supported."

5. Text/Table Extraction

****Not a primary feature.**** The page explicitly states pikepdf "is probably not what you want if you need to: Extract text or tables from PDFs."

For such tasks, it recommends alternatives like "pdfminer.six" or "pdfplumber."

6. Maintenance Status

****Actively maintained.**** Indicators include:

- Recent version releases (10.7.2 as of May 2026)
- Frequent update cadence visible in release history
- Development Status classifier: "5 - Production/Stable"
- Trusted Publishing with cryptographic attestations for releases

4. assistant (2026-05-30T19:12:13.328Z)

I have the data I need from the pikepdf PyPI page. Let me assess and structure the findings.

The page is highly relevant to the research question's password-protected-PDF support dimension, and to the license-safety constraints. pikepdf is a primary source (official PyPI project page / package metadata maintained by the project authors).

Key relevance notes for muneem:

- pikepdf supports opening password-protected PDFs (AES-256/128, RC4) ? directly relevant to the HDfC PDF password requirement, since pdfplumber/pdfminer.six cannot themselves decrypt PDFs.
- License is MPL-2.0 (file-level copyleft, not GPL/LGPL/AGPL). This is a nuance: the research question lists MIT/BSD/Apache/ISC/HPND as the explicitly-safe set. MPL-2.0 is generally considered weak/file-level copyleft and commercially safe (no viral linking obligation), but it is NOT in the stated permissive whitelist ? worth flagging as a "verify" rather than a clean pass.
- Native dep is qpdf (Apache-2.0 since v7, previously Artistic-2.0 ? both permissive; the page itself doesn't state qpdf's license, so I'll note that the page does not confirm it).
- It explicitly is NOT a table/text extractor ? so its role for muneem would be as a decryption preprocessor feeding into pdfplumber, not a parser.

5. user (2026-05-30T19:12:21.454Z)

Structured output provided successfully

6. assistant (2026-05-30T19:12:27.420Z)

Done. The pikepdf PyPI page was successfully fetched and is a primary source (official package metadata) highly relevant to the password-protected-PDF dimension of the HDfC parsing research.

Key takeaways for muneem:

- pikepdf is a strong candidate for the decryption step (handles AES-256/128/RC4 password-protected PDFs locally), filling a gap that pdfplumber/pdfminer.six leave open.
- It is NOT a table extractor ? its proper role is decrypt-then-hand-off to pdfplumber, not a replacement parser.
- License flag: MPL-2.0 (weak/file-level copyleft) is commercially safe but is outside the explicitly-whitelisted MIT/BSD/Apache/ISC/HPND set in the constraints, so it deserves a deliberate license sign-off rather than an automatic pass. The native dep qpdf's license is not stated on this page (it is Apache-2.0 in reality, but that's unverified by this source).
- Actively maintained: v10.7.2 released 2026-05-25, Production/Stable.

5 falsifiable claims returned via StructuredOutput.
