1. user (2026-06-16T03:01:27.114Z)

You are senior IP/privacy counsel writing an internal memo (general information, NOT a substitute for retained counsel) for an owner in Bangalore, India, who wants to COMMIT derived numeric data (shuttle trajectories, rally time-intervals, audio/person/court feature columns) from a labeled video corpus into a GitHub repo so external contributors can run regression tests WITHOUT the videos. Synthesize the research findings and the skeptical verifications below into ONE coherent, cited memo. Be explicit about the OWNED-corpus vs THIRD-PARTY-sourced fork, split the analysis by jurisdiction (India primary; US and EU because the product/repo are global), and state concrete, testable CONDITIONS under which a public commit of derived data is defensible (and which streams must NOT be published ? e.g. anything person/pose/biometric, anything involving minors). List the questions that genuinely need a retained lawyer. Use only citations that appear in the findings/verifications; do not invent any.

FINDINGS (JSON):

```
[  
  {  
    "question": "Is algorithmically-derived structured data ? per-frame shuttle (x,y) coordinates, rally start/end timestamps, audio-onset feature values ? extracted from a copyrighted sports video itself protected by copyright (uncopyrightable facts/data, or a \"derivative work\")? Does the derived numeric data inherit the video's copyright?",  
    "scope": "US copyright law analysis covering: idea/expression dichotomy (17 USC 102(b)); Feist (facts not copyrightable; sweat-of-the-brow rejected; originality in selection/arrangement); the 17 USC 101 \"derivative work\" definition; and intermediate/non-expressive copying + fair use (Google v. Oracle, Authors Guild v. Google, Sega v. Accolade, plus 2025 AI-training cases). This is legal-research synthesis of statutes, case law, and the U.S. Copyright Office Fair Use Index ? NOT formal legal advice. Focus is the copyright status of the OUTPUT data itself; the separate question of whether the EXTRACTION ACT (transiently copying the video) infringes is addressed via the intermediate-copying line. Foreign sui generis database rights (e.g., the EU Database Directive) are out of scope but flagged.",  
    "findings": [  
      {  
        "claim": "Facts are categorically not copyrightable because they are discovered, not authored, and thus lack the originality the Constitution and Copyright Act require; effort ('sweat of the brow') does not earn copyright. This is the foundational holding most directly governing extracted numeric data.",  
        "support": "Feist Publications v. Rural Telephone Service Co., 499 U.S. 340 (1991): the Court held 'facts are not copyrightable' because they 'do not owe their origin to an act of authorship' and so are not original, and expressly held that 'originality, not sweat of the brow, is the touchstone of copyright protection.' Copyright 'rewards originality, not effort.' Per-frame (x,y) shuttle positions, rally start/end timestamps, and audio-onset values are observable physical facts about events recorded in the video ? discovered measurements, not authored expression ? so they fall squarely within the unprotected 'facts' category regardless of the computational effort to derive them.",  
        "sourceName": "Feist Publications, Inc. v. Rural Telephone Service Co., 499 U.S. 340 (1991) ? Justia U.S. Supreme Court Center",

  },
  {
    "claim": "Facts and statistics GENERATED BY A SPORTING EVENT are not copyrightable even though the audiovisual BROADCAST of that event is ? the closest factual analogue to extracting shuttle coordinates and rally timings from a match video.",
    "support": "National Basketball Ass'n v. Motorola, Inc., 105 F.3d 841 (2d Cir. 1997): the court held 'Sports events are not authored in any common sense of the word' and that the underlying scores/statistics are uncopyrightable facts ('purely factual information which any patron of an NBA game could acquire from the arena'), while only the broadcast ? the creative work of directors, camera operators, editors ? is protected. By direct analogy, shuttle positions, rally boundaries, and onset values are facts ABOUT the game that any spectator could in principle observe; they are not original to whoever created the video, so they do not inherit the video's copyright.",
    "sourceName": "National Basketball Ass'n v. Motorola, Inc., 105 F.3d 841 (2d Cir. 1997) ? Wikipedia case summary",
    "sourceUrl": "https://en.wikipedia.org/wiki/National_Basketball_Ass%27n_v._Motorola,_Inc.",
    "confidence": "high"
  },
  {
    "claim": "Copyright never extends to any idea, procedure, process, system, method of operation, concept, principle, or discovery ? only to original expression. Measured coordinates and timestamps are 'discoveries'/facts about the recorded event and fall in the §102(b) exclusion.",
    "support": "17 U.S.C. § 102(b): 'In no case does copyright protection for an original work of authorship extend to any idea, procedure, process, system, method of operation, concept, principle, or discovery, regardless of the form in which it is described, explained, illustrated, or embodied in such work.' This is the statutory codification of the idea/expression dichotomy and confirms that the factual/discovered content extracted from the video (the where-and-when of the shuttle and rallies) is outside the scope of the video's copyright.",
    "sourceName": "17 U.S.C. § 102 ? BitLaw / U.S. Code",
    "sourceUrl": "https://www.bitlaw.com/source/17usc/102.html",
    "confidence": "high"
  },
  {
    "claim": "A 'derivative work' is a work that recasts, transforms, or adapts a preexisting work's EXPRESSION (e.g., translation, motion-picture version, abridgment). Stripping out non-expressive numeric facts is not 'recasting' the audiovisual expression, so the coordinate/timestamp/feature data is not a derivative work that inherits the video's copyright.",
    "support": "17 U.S.C. § 101 defines a derivative work as 'a work based upon one or more preexisting works, such as a translation, musical arrangement, dramatization, fictionalization, motion picture version, sound recording, art reproduction, abridgment, condensation, or any other form in which a work may be recast, transformed, or adapted.' Each enumerated example reuses the original's protected EXPRESSION. A table of (x,y) positions and timestamps reproduces none of the video's expressive elements (framing, editing, commentary, imagery); it captures only facts, which §102(b)/Feist place outside copyright. A derivative-work claim therefore fails because there is no protected expression carried into the output.",
    "sourceName": "17 U.S.C. § 101 Definitions ? Legal Information Institute (Cornell)",
    "sourceUrl": "https://www.law.cornell.edu/uscode/text/17/101",
    "confidence": "high"
  },
  {
    "claim": "A compilation/database of facts can earn a THIN copyright, but only in the original SELECTION, COORDINATION, OR ARRANGEMENT ? never in the underlying facts. So a creatively-organized dataset might get limited protection for its structure, but a competitor remains free to copy the raw numbers themselves.",
    "support": "17 U.S.C. § 101 defines a 'compilation' as data 'selected, coordinated, or arranged in such a way that the resulting work as a whole constitutes an original work of authorship,' and Feist holds copyright in a compilation 'extends only to those components of the work that are original to the author, not to the facts themselves.' Practical upshot: any copyright the extractor obtains is in the dataset's expressive arrangement (if creative), not in

```

the shuttle coordinates, rally timestamps, or onset values, which remain free for others to use.",

"sourceName": "Feist Publications, Inc. v. Rural Telephone Service Co., 499 U.S. 340 (1991) ? Justia",

"confidence": "high"

},

{

"claim": "The act of EXTRACTION (transiently copying the video to analyze it) is a distinct question from the status of the OUTPUT data ? and intermediate copying CAN infringe even when the end product does not reproduce protected expression, so the extraction step must independently rely on a license or fair use.",

"support": "Sega Enterprises Ltd. v. Accolade, Inc., 977 F.2d 1510 (9th Cir. 1992): 'intermediate copying of computer object code may infringe the exclusive rights granted to the copyright owner in section 106 ... regardless of whether the end product of the copying also infringes those rights.' But the same court held that copying to access UNPROTECTED functional/ideational elements is fair use where it is the only means of access and there is a legitimate reason, because §102(b) elements 'are not protected by copyright.' Applied here: even though the numeric output is unprotectable, ingesting the video to compute it is itself a reproduction that needs a lawful basis (license to the source video, or a fair-use justification for the analytic copying).",

"sourceName": "Sega Enterprises Ltd. v. Accolade, Inc., 977 F.2d 1510 (9th Cir. 1992) ? BitLaw",

"confidence": "high"

},

{

"claim": "Copying a whole work for a NON-EXPRESSIVE, analytical purpose ? to build an index/search function or extract data rather than to deliver the original's expression to the public ? is strongly favored as transformative fair use. This squarely supports the extraction pipeline if it must rely on fair use.",

"support": "Authors Guild v. Google, Inc., 804 F.3d 202 (2d Cir. 2015): the court held that 'verbatim copying of works for a different, non-expressive purpose can be a transformative fair use' ? Google copied entire books to build a searchable index and show snippets, which 'augments public knowledge ... without providing the public with a substantial substitute' for the originals. Extracting positional/temporal/audio-feature data is non-expressive analytic use that does not republish the video's expression, fitting this transformative-purpose rationale.",

"sourceName": "Authors Guild v. Google, Inc., 804 F.3d 202 (2d Cir. 2015) ? Justia (Second Circuit opinion)",

},

{

"claim": "The Supreme Court has reinforced that functional, non-expressive material lies far from copyright's core and that reusing it for a new, productive purpose is transformative fair use ? and that any losses tied to function rather than expression do not count against fair use.",

"support": "Google LLC v. Oracle Am., Inc., 141 S. Ct. 1183 (2021), as summarized in the U.S. Copyright Office Fair Use Index: the Court found Google's copying of declaring code 'transformative' because it 'adds something new and important,' that the code was 'functional in nature' and 'further than most computer programs from the core of copyright,' and that Oracle's losses 'were due not to the expressive qualities ... but to programmers having become accustomed to' certain calls. By analogy, the value of extracted shuttle/rally/audio data derives from factual/functional content, not the video's expression, reinforcing that the data does not inherit the video's copyright and that analytic extraction is transformative.",

"sourceName": "Google LLC v. Oracle Am., Inc., 141 S. Ct. 1183 (2021) ? U.S. Copyright Office Fair Use Index summary",

"sourceUrl": "https://www.copyright.gov/fair-use/summaries/google-llc-oracle-am-inc-2021.pdf",

{

"claim": "Recent (2025) AI-training decisions confirm the modern through-line: courts treat using copyrighted works 'as data rather than expression' as transformative/non-expressive

use that favors fair use, while output that reproduces a work's expressive market function does not.",

"support": "As summarized in legal commentary on Bartz v. Anthropic, Kadrey v. Meta, and Thomson Reuters v. Ross (2025): courts 'accept complete copying when it is technologically necessary and non-expressive, with the end user never receiving the protected content,' and 'when the training is analytical ? using works as data rather than expression ? it passes' fair use. This supports treating feature extraction (data, not expression) as non-infringing in its OUTPUT and favorable on fair use for the extraction step; however, this body of law is new, fact-specific, and partly unsettled (mixed outcomes; appeals likely).",

"sourceName": "Training Data on Trial: AI's First Fair Use Test ? IPWatchdog",

}

],

"bottomLine": "Under US copyright law, the DERIVED NUMERIC DATA itself does NOT inherit the video's copyright. Per-frame shuttle (x,y) coordinates, rally start/end timestamps, and audio-onset feature values are uncopyrightable FACTS/measurements about the recorded event ? discovered, not authored ? so under Feist (facts are never copyrightable; \"sweat of the brow\" rejected), §102(b) (no copyright in any \"idea, procedure, process ... or discovery\"), and NBA v. Motorola (facts generated by a sporting event are uncopyrightable even though the broadcast is), the data is outside the scope of the video's copyright. It is also NOT a \"derivative work\" under §101: a derivative work recasts/transforms/adapts the original's protected EXPRESSION (framing, editing, imagery, commentary), and a coordinate/timestamp table carries none of that expression ? only facts. The most that copyright could attach to is a THIN protection in an original SELECTION/COORDINATION/ARRANGEMENT of the resulting dataset (a creatively designed schema), never in the raw numbers, which competitors stay free to copy. CRITICAL CAVEAT ? keep two questions separate: (1) the STATUS of the output data (clearly unprotected facts), versus (2) the ACT of extraction. Sega v. Accolade holds intermediate copying CAN infringe even when the end product reproduces no protected expression, so transiently copying/ingesting the source video to compute the data needs its own lawful basis ? either a license to that video or a fair-use defense. The fair-use line is strongly favorable for analytic, non-expressive extraction: Authors Guild v. Google (verbatim copying for a non-expressive search/index purpose is transformative fair use), Google v. Oracle (functional material is far from copyright's core; reuse for a new productive purpose is transformative), and the 2025 AI-training rulings (using works \"as data rather than expression\" favors fair use). Net: ingest only videos you have the right to use (clean-licensed/owned/permissioned sources), and the derived numeric dataset is yours to use and publish as uncopyrightable facts ? consistent with the repo's \"paid LLMs are inference-only, never a training-data source\" and \"commercial-clean licensing\" guardrails, which address the SOURCE-acquisition side that this fact/expression analysis does not resolve.",

"caveats": [

"NOT legal advice ? this is a research synthesis of US statutes/case law and the U.S. Copyright Office Fair Use Index. For a commercial product, get a qualified IP attorney's opinion, especially on the extraction/ingestion step.",

"Two distinct questions: (a) the COPYRIGHT STATUS of the output data (settled: unprotectable facts) versus (b) whether the ACT of copying the source video to extract it infringes. This brief answers (a) firmly; (b) depends on your license to the source video or a fair-use defense, which is fact-specific.",

"Fair use for the extraction step is a multi-factor, case-by-case defense, not a categorical safe harbor. The 2025 AI-training decisions (Bartz v. Anthropic, Kadrey v. Meta, Thomson Reuters v. Ross) are recent, fact-bound, partly conflicting, and likely subject to appeal ? treat their support as directional, not settled (rated medium confidence).",

"A creative SELECTION/ARRANGEMENT of the dataset (schema, curation, an annotated golden set) could attract THIN compilation copyright in its structure ? but that protects only the arrangement, never the underlying numbers, and a purely mechanical/exhaustive layout (every frame, every rally) likely has too little originality to qualify (the Feist 'garden-variety alphabetical listing' problem).",

"This is US law. Other jurisdictions differ materially ? notably the EU, where the sui generis Database Right (Database Directive 96/9/EC) can protect a database built with substantial investment EVEN absent original selection/arrangement. If you operate or distribute in the EU/UK, raw extracted data may enjoy protection that US law denies. Not researched here.",

"Justia's Feist page returned HTTP 403 to the fetcher, so Feist quotes are corroborated via the search-result extract and the Justia URL rather than a full-text fetch; the Feist holdings cited are well established and also reflected in the §101/§102 statutory sources that

were fetched directly.",

"Adjacent doctrines not analyzed: trademark, contractual/Terms-of-Service restrictions on the source video, broadcaster anti-piracy and hot-news misappropriation (NBA v. Motorola also addressed a state misappropriation claim), and personality/biometric rights ? any of which could constrain use independent of copyright."

```
    ],
    "webUsed": true
  },
  {
    "question": "Under the EU sui generis database right (Directive 96/9/EC) and copyright, does extracting and redistributing DERIVED match data (coordinates / event timestamps) from a broadcast infringe?",
    "scope": "EU law only (Directive 96/9/EC as interpreted by the CJEU). Covers: (1) sui generis database right ? \"obtaining vs creating\" data and \"extraction/re-utilisation of a substantial part\"; (2) database copyright (originality); (3) where re-utilisation occurs (targeting); (4) contract overriding the directive's user exceptions for UNPROTECTED databases. Focus = independently DERIVED numeric streams (shuttle/player coordinates, rally/event timestamps) computed by our own CV/AI from a broadcast video, then redistributed. NOT advice on: broadcast/film copyright in the video signal itself, performers'/sports-organiser commercial rights, unfair-competition/parasitism under national law, or post-Brexit UK law (UK retained a parallel but now-diverging regime). Not legal advice; consult EU IP counsel before relying.",
    "webUsed": true,
    "findings": [
      {
        "claim": "The sui generis database right protects only investment in OBTAINING (seeking out and collecting pre-existing independent materials), VERIFYING, or PRESENTING contents ? NOT investment in CREATING the data. Resources spent generating new data do not count toward the 'substantial investment' that triggers the right.",
        "support": "In C-203/02 the CJEU held that 'investment in ? the obtaining ? of the contents refers to the resources used to seek out existing independent materials and collect them' and that resources used to CREATE the data (e.g. fixing the list of runners) fall outside this and do not count toward substantial investment under Art 7(1). The parallel Fixtures Marketing line (C-46/02, C-338/02, C-444/02, decided the same day) reached the same conclusion for football fixture lists: investment in generating the data does not qualify.",
        "sourceName": "EUR-Lex ? Case C-203/02 British Horseracing Board v William Hill (judgment, 9 Nov 2004)",

}

],

"bottomLine": "For our use case ? numeric streams (shuttle/player coordinates, rally/event timestamps) that we COMPUTE ourselves from a broadcast via CV/AI and then redistribute ? the EU IP exposure on the database-right/copyright axis is LOW, but it is NOT zero, and the real risk lives in contract, not IP. Why low on IP: (1) Sui generis right ? under BHB v William Hill (C-203/02) and the Fixtures Marketing line, the right protects investment in OBTAINING/verifying/presenting pre-existing data, not in CREATING it. Coordinates and event timings we derive frame-by-frame are data we CREATE by our own measurement; we are not seeking out and copying a substantial part of someone else's collected dataset. We extract from the VIDEO (a film/broadcast work), not from the rights-holder's official stats database, so 'extraction of a substantial part' of a protected database is hard to make out, and Art 7(5) systematic-takings liability also requires an underlying protected substantial part. (2) Copyright ? under Football Dataco v Yahoo (C-604/10), copyright protects only an original selection/arrangement (structure), never the raw numbers, and never sweat-of-the-brow; our derived coordinates are facts, not a copied original structure. Where it CAN bite: (a) Contract ? Ryanair v PR Aviation (C-30/14) is the live danger: even with no IP right at all, the source's terms of use / broadcast or feed licence can lawfully ban automated extraction and redistribution and bind us if we accepted them; this is the most likely route to liability and is governed by the licence/T&Cs you click through, not the Directive. (b) If you ever ingest an OFFICIAL data feed/stats database rather than self-deriving from pixels, the obtaining-vs-creating analysis flips toward the rights-holder and substantial-part infringement becomes plausible. (c) Football Dataco v Sportradar (C-173/11) means you cannot dodge EU exposure by server location if you target EU users. Separately, the broadcast VIDEO itself is a protected film/signal ? copying or redistributing the footage (as opposed to derived numbers) is a different, real infringement; our highlight reels live on that axis, not this one. Practical guardrail consistent with the project's licensing discipline: self-derive numeric data from sources you are licensed to process, do not scrape official stats feeds, and read every source's T&Cs/licence for automated-extraction and redistribution clauses before ingesting.",

"caveats": [

"Not legal advice ? these are CJEU holdings synthesized from authoritative sources; get EU IP counsel before relying, especially before any commercial data product.",

"The favourable IP analysis assumes we DERIVE the numeric data ourselves from video (creation), and do NOT copy a substantial part of an official/third-party stats database (obtaining). If the input is a licensed/scraped official feed, the conclusion can reverse.",

"Redistributing the broadcast VIDEO/footage itself (highlight clips) raises separate film/broadcast copyright and related-rights issues NOT analysed here ? this question was scoped to derived numeric streams only.",

"Contract (Ryanair C-30/14) is the dominant residual risk and is fact-specific to each source's terms of use / licence; a click-through or feed licence banning automated extraction or commercial redistribution can bind us even with zero IP right in the data.",

"National-law theories beyond the Directive (e.g. unfair competition / parasitism in some Member States, and protections the Directive expressly leaves to national law per Ryanair) are out of scope and may add exposure.",

"Post-Brexit UK has retained a parallel database-right regime that is beginning to diverge from the EU; UK-specific advice is out of scope here.",

"The C-173/11 operative-ruling detail was verified via IPCuria rather than the primary EUR-Lex text; substance is corroborated across multiple commentaries but the exact wording should be confirmed against the EUR-Lex judgment (CELEX 62011CJ0173) before quoting verbatim."

    "confidence": "high"
  }
],

```

"bottomLine": "Committing derived data is a CONTRACT problem (independent of copyright) whenever the data was obtained under an enforceable Terms of Service that bars scraping/extraction/redistribution/commercial reuse ? and post-Van Buren that contract route is precisely what platforms rely on, because the CFAA no longer reaches mere purpose-violations of accessible/public data. Two thresholds decide whether the ToS actually bites: (1) Was there an account/login or clickwrap 'I agree'? If yes (hiQ; any logged-in or YouTube-API/account user), the ToS binds and scraping + redistributing a derived dataset is breach of contract even if every clip is non-copyrightable or fair use. If the data was scraped purely logged-out from public pages with only a browserwrap link (Meta v. Bright Data), the contract may not bind at all. (2) The redistribution step ? committing the dataset to a public repo ? is the highest-risk act, since most ToS independently bar 'distribute'/commercial reuse and it's what turns tolerated scraping into an enforced breach. CONVERSELY, when the corpus is the OWNER'S OWN recordings, there is no third-party contract to breach and the analysis flips to trade secret: the data is a protectable competitive moat under 18 U.S.C. § 1839 only if kept secret with reasonable measures AND it derives value from not being generally known ? so publishing it (the very act of committing it publicly) forfeits that moat. Net rule for the repo: third-party-sourced derived data that was obtained under a ToS-bound relationship should NOT be committed publicly (contract/redistribution risk that copyright analysis won't catch); owner-recorded derived data is the owner's to publish or protect, where the only thing at stake is the trade-secret moat, not anyone else's contract.",

"caveats": [

"Not legal advice. This is U.S.-centric (Ninth Circuit / N.D. Cal. heavy, federal CFAA/DTSA). The indexer owner is Bangalore-based; Indian law (Indian Contract Act 1872, IT Act 2000, and India's evolving data-protection regime) was NOT analyzed and may treat ToS-formation, browserwrap, and trade secrets differently ? get India-qualified counsel for binding conclusions.",

"hiQ and Bright Data are trial-court / Ninth Circuit outcomes (one settled, one dismissed pre-appeal), not Supreme Court precedent, and partly turned on California contract law and the specific wording/evolution of each platform's terms ? outcomes are fact- and circuit-specific and the law is still unsettled.",

"The 'logged-out public scraping isn't bound by ToS' result is favorable but not universal: it depended on Meta having deleted language binding non-users; a platform whose current ToS expressly binds all visitors, or that puts content behind login/clickwrap (most broadcaster OTT services do), changes the answer. YouTube content via the API or any signed-in/clickthrough flow is squarely contract-bound.",

"Copyright, database rights (e.g., EU sui generis), publicity/privacy rights, and platform technical countermeasures (trespass to chattels, as also found against hiQ) are SEPARATE exposure tracks not fully analyzed here ? a clean contract posture does not by itself clear those.",

"The faces/biometrics restriction in YouTube's ToS and GDPR/India privacy law intersect with this repo's own committed guardrail excluding biometrics/minors; redistributing footage of identifiable people raises privacy exposure beyond the contract/trade-secret axes covered here.",

"One secondary commentary source on redistribution-escalation (PromptCloud) is industry commentary rather than a court or statute, hence medium confidence; the underlying redistribution-bars are anchored in the verbatim YouTube ToS and the hiQ ruling."

  "confidence": "medium"
}
},
"bottomLine": "Triage by what the stream is ABOUT and whether it can single out a person. (1) SHUTTLE coordinates describe an inanimate object ? not personal data, and safe to publish, UNLESS you join them to data that singles out a specific player. (2) PERSON BOUNDING BOXES (detect/locate/count, or estimate age/gender) are ordinary personal data when they single out a human, but are NOT Art.9 biometric data as long as the purpose is to detect/categorize, not

```

uniquely identify ? publishing coordinates stripped of any identity link is low-risk; publishing the cropped images is identifying personal data. (3) POSE KEYPOINTS / GAIT are the danger zone: gait is a behavioural biometric that re-identifies people even with faces blurred, and skeleton 'anonymization' provably leaves gait identity intact ? so raw pose/gait tracks are NOT reliably anonymous, are personal data when usable to single out a player, and become Art.9 special-category (needing explicit consent) the moment they are used to uniquely identify. Practical publish/no-publish: shuttle tracks = publish freely; bbox/pose COORDINATES detached from any identity and used only for rally detection = generally OK with normal personal-data hygiene; named player + gait/pose signature, or any face crop = do NOT publish without an explicit-consent Art.9 basis. MINORS flip everything: under India's DPDP (child = under 18) you need VERIFIABLE parental consent (Rule 10 ? real ID/age verification, not a checkbox) before processing ANY child's data, you may not cause detrimental effects, and s.9(3) flatly BANS tracking/behavioural monitoring of children ? which a persistent pose/gait signature arguably is. The cleanest path for footage containing minors is to exclude them from any persisted derived stream beyond inanimate shuttle data, or obtain verified parental consent and keep only de-identified object/coordinate data. This matches the project's existing guardrails: exclude minors from training, treat gait/biometrics as strictly future (GDPR Art.9), and keep a generic schema.",

"caveats": [

"This is a legal-risk research memo from public sources, not legal advice ? counsel sign-off is needed before publishing any human-derived stream commercially, especially anything touching minors.",

"The 'shuttle = not personal data' conclusion holds ONLY while shuttle coordinates are not joined to anything that singles out a player; WP136/CJEU confirm object-data can become personal data via the content/purpose/result link, so a per-player shuttle-track tied to a named athlete could itself be personal data.",

"Whether bounding-box / pose COORDINATES (numbers, no imagery) are 'anonymous' is fact-specific under Recital 26's 'means reasonably likely to be used' test ? in a small, known squad (e.g. a club roster) even coordinates can single out a player, defeating anonymity; the gait evidence shows pose coordinates specifically can re-identify.",

"The EDPB Guidelines 3/2019 text was confirmed via a reputable law-firm summary (Fox Rothschild) because the official PDF could not be parsed by the fetch tool; paragraph-exact wording should be checked against the EDPB original before relying on it.",

"DPDP Rules 2025 detail (Rule 10) is recent and was read from a secondary compilation (dpdpa.com), not the official Gazette ? verify the operative text and any class-of-fiduciary/research exemptions under s.9(4)?(5) before designing the consent flow.",

"No India case law yet interprets pose/gait as biometric/personal data; the India analysis leans on the statutory text of s.9 and the DPDP definition of 'personal data', plus EU-analogous reasoning ? treat the India biometric characterization as reasoned inference, not settled law.",

"Purpose of uniquely identifying' is assessed on intended use: the SAME pose/gait pipeline that is non-special-category for rally detection can flip into Art.9 territory if anyone later repurposes it for player ID ? so the safeguard is purpose-limitation + not persisting identifiable gait signatures, not the modality alone."

"confidence": "high"

}

],

"bottomLine": "Non-attributability is a property of the (data, holder, environment) triple ? not of the timeseries itself. Legally, \"anonymous\" is a risk standard, not an absolute: under GDPR Recital 26, as construed by CJEU Breyer (relative approach) and EDPB Guidelines 01/2025, data is non-attributable only when re-identification is not \"reasonably likely\" given the means realistically available to whoever holds it ? and the Art. 29 WP / ICO frameworks treat linking a record back to its source as exactly the \"linkability\" risk that robust anonymisation must defeat. Technically, a derived per-video trajectory/feature stream is essentially a fingerprint: high-dimensional traces are near-unique (de Montjoye: 4 points -> 95%; k-anonymity collapses to k=1 on rich quasi-identifiers), and a deterministic detector re-run reproduces a correlatable stream that temporal-correlation alignment can match. So the fingerprinting attack the question describes is FEASIBLE ? but ONLY against something to correlate with. That is the whole game on the public-vs-private axis: (1) PUBLIC source (broadcast/YouTube): a permanent, cheap reference exists; an adversary can re-run the same detector on candidate videos and confirm the match. Re-linkage is \"reasonably likely\" and the raw stream should be treated as effectively attributable to its source ? coarsening/feature-reduction reduce but do not reliably eliminate this, and the risk only grows as more public video and better matchers appear. Strong source-non-attributability for raw streams here is NOT achievable; if you need it, you must use a release model that breaks correlatability (heavy aggregation, perturbation/differential privacy, synthetic data, or a non-public enclave per NIST SP 800-188). (2) PRIVATE/owner-recorded source, never published: there is no reference stream in the world to correlate against, so source-linkage by an external adversary is not \"reasonably likely\" ? strong non-attributability of the SOURCE is genuinely achievable for that adversary, and is in fact the default. The caveats: it is conditional and revocable (publish the source later, or leak it, and the link snaps back into \"reasonably likely\"); it protects the source-video link, not necessarily the human (a player still identifiable by other auxiliary data is a separate inference/linkability question); and it is relative to the adversary's auxiliary data ? a party that already holds the source file (or its hash) can always re-link, so \"anonymous to outsiders\" is not \"anonymous to everyone.\"",

```

    "caveats": [
      "Source-linkage (which video did this come from) is a different question from human
      identification (who is the player). A timeseries can be strongly non-attributable to a source
      yet still expose a person via other auxiliary data, or vice versa ? keep the two threat models
      separate.",
      "Private-source non-attributability is CONDITIONAL and not durable: it holds only while
      the source stays unpublished and uncompromised. Publishing the source later, a leak, or an
      adversary obtaining the file/its hash re-enables linkage retroactively (the GDPR/ICO 'reassess
      when new data is released' point).",
      "Identifiability is relative to the adversary: a party that holds the source file, the
      detector + the source, or a stored mapping can always re-link regardless of how 'anonymised' the
      stream looks. 'Anonymous to an external adversary' is not 'anonymous to the controller.'",
      "The de Montjoye 95%/4-points and 1/10-power figures are quoted from the canonical
      Scientific Reports paper but were corroborated only via secondary summaries here ? the primary
      PDF returned 403/405 from Nature, MIT DSpace and the Auckland mirror, so that specific finding
      is marked medium confidence.",
      "NIST SP 800-188's full text did not parse from the PDF; the data-sharing-model taxonomy
      (publish / synthetic / query interface / protected enclave) and 'limitations of traditional vs
      formal methods' framing are drawn from official NIST/CSRC summary pages, which is reliable but
      is a summary, not the verbatim section text.",
      "The relative/'subjective' approach is under active legal flux (post-SRB EDPB
      reconsideration; stakeholders complain 'reasonably likely' is undefined). The direction of
      travel supports the private-vs-public distinction, but the exact threshold for 'reasonably
      likely' is not yet settled in case law/guidance, so treat any bright line cautiously.",
      "Coarsening, quantisation, or low-dimensional feature reduction RAISE the cost of a
      correlation match but do not categorically defeat it against a public source (uniqueness decays
      only ~1/10 power with resolution); only aggregation across many sources,
      perturbation/differential privacy, synthetic data, or withholding the raw stream give a
      defensible non-attributability claim for public-sourced data."
    ],
    "webUsed": true

SKEPTICAL VERIFICATIONS (JSON):

```

[
  {
    "questionKey": "copyright-facts",
    "centralClaim": "Derived numeric data (per-frame shuttle (x,y) coordinates, rally start/end
    timestamps, audio-onset feature values) does not inherit the source video's copyright: it is
    uncopyrightable facts/measurements under Feist, §102(b), and NBA v. Motorola, and a
    coordinate/timestamp table is not a §101 derivative work (it carries none of the video's
    protected expression); at most a thin compilation copyright attaches to a creative
    selection/arrangement. The act of extraction is a separate question ? intermediate copying can
    infringe (Sega) ? but the fair-use line for non-expressive analytic extraction is \"strongly
    favorable\" (Authors Guild v. Google, Google v. Oracle, 2025 AI-training rulings), so the
    practical rule is: ingest only clean-licensed/owned/permissioned videos and the derived dataset
    is yours to use and publish as uncopyrightable facts.",
    "verdict": "qualified",
    "reasoning": "The narrow doctrinal core is correct and well-supported: facts/measurements
    about a recorded event are uncopyrightable (Feist: \"originality, not sweat of the brow, is the
    touchstone\"; §102(b) excludes any \"discovery\"; NBA v. Motorola: game facts are \"purely
    factual information which any patron of an NBA game could acquire from the arena\"), and a bare
    coordinate/timestamp table reuses none of the video's protected expression, so it is not a §101
    derivative work; compilation protection is \"thin\" (Feist). To that extent the bottom line is
    supported. But the memo is materially OVER-CONFIDENT in ways that could get the client in
    trouble, which is why the verdict is qualified rather than supported.\n\n(1) The fair-use
    defense for the EXTRACTION step is now genuinely contested, not \"strongly favorable.\" The memo
    treats Authors Guild, Google v. Oracle and the 2025 AI rulings as nearly settling the point. But
    Thomson Reuters v. Ross (D. Del. 2025) squarely REJECTED the \"I copied an expressive work only
    to reach unprotected facts/data\" theory: the court held one \"cannot justify copying expressive
    works simply by claiming the goal was to reach unprotected facts,\" distinguished
    Sega/Sony/Oracle as functional-CODE cases (\"those cases are all about copying computer code.
    This case is not.\"), found the use non-transformative, and found Factor 4 harm in a derivative
    market for \"data to train AIs\" even though the plaintiff had not entered that market. A
  }
]

```

commercial badminton-analytics product whose dataset competes with a rights-holder's own data/analytics licensing fits Ross's reasoning, not Authors Guild's snippet-index reasoning. The U.S. Copyright Office's May 2025 Part 3 report likewise REJECTS the \"AI training is inherently transformative because non-expressive\" argument and endorses a market-dilution theory of harm under Factor 4. So the extraction-side fair-use outcome is fact-specific and unsettled, with real adverse authority ? overstating it as \"strongly favorable\" invites a client to over-rely on a defense that just failed in the closest 2025 case.\n\n(2) The lawful-source caveat is LOAD-BEARING and unlawful acquisition can independently destroy the defense. Sega's intermediate-copying fair use is conditioned on necessity (\"disassembly... the ONLY means of access to those elements... not protected\") PLUS a legitimate reason ? a real limit, not a blanket analytic pass. Bartz v. Anthropic (N.D. Cal. 2025) holds that even a \"spectacularly transformative\" end use did NOT cure infringement arising from pirated source copies, and that piracy-based liability \"could [not] be undone by later\" lawful use ? a holding that produced an ~\$1.5B settlement. The memo's \"ingest only clean-licensed/owned/permissioned videos\" line is therefore not a footnote; it is the dispositive fact, and the memo's framing risks burying it.\n\n(3) Copyright is NOT the only fence ? the memo's \"facts are free to copy\" framing ignores non-copyright theories that survive precisely BECAUSE the data is uncopyrightable. NBA v. Motorola preserved a narrow five-element hot-news misappropriation tort (costly + time-sensitive info + direct competition + free-riding). hiQ/Van Buren expressly left contract, misappropriation and trespass claims intact even where CFAA fails, and ProCD v. Zeidenberg holds anti-scraping / no-extraction ToS clauses are enforceable and NOT preempted by copyright ? so a \"no data extraction\" license term can ground a breach-of-contract claim even though the numbers themselves are uncopyrightable facts. And the analysis is US-only: a Bangalore-based commercial operation publishing the dataset faces EU/UK sui generis database right exposure (Database Directive Art. 7's \"substantial part\" extraction right), even though BHB v. William Hill narrows it for created (as opposed to obtained) data. None of these non-copyright fences is addressed.\n\nBottom line: the status of the OUTPUT data as uncopyrightable facts is solid; the memo's confidence about the EXTRACTION step's fair-use safety, and its silence on contract/misappropriation/database-right exposure and on the source-acquisition's outcome-determinative role, are the qualifications a skeptical second lawyer must flag.

\"correctedClaim\": \"The derived numeric data itself (shuttle (x,y) coordinates, rally timestamps, audio-onset values) is uncopyrightable FACT/measurement and does not inherit the source video's copyright, and a bare coordinate/timestamp table is not a §101 derivative work ? Feist, §102(b), and NBA v. Motorola support this, with at most a thin compilation copyright in a creative schema. BUT two cautions are essential. First, the legality of the EXTRACTION (transiently copying the video to compute the data) is a separate, currently UNSETTLED question, not a strongly favorable one: Sega makes intermediate copying potentially infringing and limits its fair-use safe harbor to copying that is the only means to reach unprotected elements; Thomson Reuters v. Ross (2025) rejected the \"copy an expressive work just to extract facts/data\" fair-use theory, distinguished the functional-code cases (Oracle/Sega/Sony), and found market harm in a derivative data-for-AI market; and the U.S. Copyright Office (2025) rejected the \"non-expressive therefore inherently transformative\" argument and backs a market-dilution harm theory. Fair use here is fact-specific and competition-sensitive ? if the resulting dataset competes with the rights-holder's own data/analytics market, fair use may fail. Second, the source-acquisition basis is outcome-determinative and unlawful acquisition can independently defeat the defense regardless of how transformative the end use is (Bartz v. Anthropic, 2025; ~\$1.5B settlement). Finally, even where copyright does not reach the facts, NON-copyright fences can: contractual no-extraction/anti-scraping terms are enforceable and not preempted (ProCD), hot-news misappropriation survives in narrow competitive circumstances (NBA v. Motorola), and?relevant to a non-US/commercial operation?EU/UK sui generis database rights may restrict extraction of a substantial part. Practical rule: ingest only clean-licensed/owned/permissioned video AND confirm the license/ToS does not bar data extraction; only then is publishing the derived dataset as uncopyrightable facts reasonably safe ? and even then U.S. fair use for any required copying remains a litigable, not settled, question.\"

{
  "questionKey": "eu-database-right",
  "centralClaim": "For numeric streams (shuttle/player coordinates, rally/event timestamps)
that we compute ourselves from a broadcast via CV/AI and then redistribute, the EU IP exposure
on the database-right/copyright axis is LOW (because the data is \"created,\" not \"obtained,\"
under BHB/Fixtures Marketing, and copyright protects only original structure under Football
Dataco v Yahoo), with the real residual risk living in contract (Ryanair v PR Aviation) and on
the separate footage/broadcast-copyright axis.",
  "verdict": "qualified",
  "reasoning": "The doctrinal skeleton is accurate and well-sourced: BHB v William Hill
(C-203/02) and the Fixtures Marketing quartet do exclude investment in CREATING data; Football
Dataco v Yahoo (C-604/10) does limit database copyright to original selection/arrangement and

```

excludes sweat-of-the-brow; Ryanair v PR Aviation (C-30/14) does let an owner impose enforceable contractual extraction/redistribution bans even where no IP subsists; and Football Dataco v Sportradar (C-173/11) does defeat the server-location dodge for EU-targeted re-utilisation. On those four pillars the memo is right. But the verdict is "qualified," not "supported," because the memo's SINGLE most load-bearing factual premise is the weakest legal point and is contradicted by the leading on-point authority.

(1) THE "WE CREATE THE DATA" PREMISE IS CONTESTABLE AND LIKELY WRONG ON THE BETTER VIEW. The memo treats frame-by-frame coordinates and event timings as data we "create by our own measurement," dropping us outside the sui generis right. That is precisely the argument the defendant LOST in Football Dataco v Sportradar at the national merits stage. Floyd J held that the "Football Live" compilation of live match events (goals, scorers, penalties, substitutions) attracted the sui generis right as OBTAINED data, reasoning that although the recorded materials did not pre-exist, "there were pre-existing facts, namely the events taking place on the pitch" ? the facts existed when the events occurred, not when recorded ? and, crucially, the recorder did NOT control the events (unlike the fixtures-list maker in BHB, who controlled the data by fixing it). A badminton rally, a shuttle's position, and the moment of a let or a smash are exactly such pre-existing physical facts on the court that we observe and record; we do not control or author them. So a rights-holder can credibly argue our streams are "obtained/recorded," not "created," flipping the BHB analysis toward protectability. The memo's framing that measurement = creation is therefore an overconfident reading a court could reject. This is the qualifier the client most needs to hear.

(2) THE MEMO OMITTS THE CONTROLLING MODERN INFRINGEMENT TEST: CV-Online Latvia (C-762/19, 3 June 2021). This post-dates every case the memo cites and reshapes the substantial-part inquiry: extraction/re-utilisation of a substantial part is prohibited only where it "adversely affects the [maker's] investment ... constitut[ing] a risk to the possibility of redeeming that investment," balanced against the free flow of information and competition. This cuts BOTH ways and the memo cites neither side. It HELPS us (a court must find real harm to the rights-holder's ability to recoup, and our derived numbers from broadcast pixels may not parasitise their official feed). But it also means the analysis is no longer the clean "no protected substantial part = safe" rule the memo implies; it is a fact-intensive, harm-and-competition balancing the memo doesn't engage.

(3) THE MEMO IS EU-ONLY AND MISSES UK POST-BREXIT DIVERGENCE. The UK retained its own sui generis database right (assimilated law) and applies pre-2021 CJEU case law ? including, on its own facts, the Sportradar "obtained match events" reasoning. If the UK is a target market (a likely English-language market for highlight products), exposure there is governed by UK law, which is at least as claimant-friendly on the obtaining/creating point, and "EU exposure is low" understates UK risk. Note too the eligibility asymmetry: a non-UK/non-EEA maker may not even hold the right defensively, but that does nothing to reduce our exposure as a potential infringer of a UK/EEA rights-holder's database.

(4) THE CONTRACT AND FOOTAGE POINTS ARE CORRECT AND, IF ANYTHING, UNDERSTATED. Ryanair is correctly flagged as the live danger. But the memo's "self-derive from sources you are licensed to process" guardrail can be self-defeating: most broadcast/streaming licences and platform T&Cs that would make our INGESTION lawful are exactly the instruments most likely to ban automated extraction and redistribution of derived data ? so the act that cures the footage-copyright problem (a licence) is often the act that creates the contract problem. And the separate film/broadcast-copyright axis (copying/redistributing the footage in highlight reels) is correctly walled off but is the project's largest real exposure; the memo should not let the "IP is low" headline bleed into that axis.

Net: the conclusion "LOW but not zero on IP, real risk in contract and footage" is defensible as a bottom line, but it rests on an overstated creating-vs-obtaining call that the leading authority undermines, omits the controlling 2021 CJEU test, and ignores UK divergence. An over-confident reading ("our numbers are created data, so we're clear on the database right") could get the client sued and lose ? exactly as the Sportradar defendant did.",

"correctedClaim": "For numeric streams (shuttle/player coordinates, rally/event timestamps) we compute from a broadcast via CV/AI and redistribute, EU/UK database-right and copyright exposure is REDUCED but is NOT reliably "low," and should not be characterised as near-zero.

(1) The pivotal premise ? that self-derived coordinates are "created," not "obtained" ? is genuinely contestable: in Football Dataco v Sportradar the live match-event data (goals/scorers) was held to be OBTAINED, because the recorder captured pre-existing facts ("events taking place on the pitch") that it did not control; a badminton rally/shuttle position is the same kind of pre-existing fact we record rather than author, so a rights-holder can argue the sui generis right subsists in our streams. (2) Infringement is now governed by CV-Online Latvia (C-762/19, 2021): even a substantial-part taking is actionable only where it adversely affects the maker's ability to recoup its investment, balanced against information flow/competition ? a fact-intensive test, not a clean exemption. (3) The UK retained its own database right and pre-2021 case law, so UK-targeted products carry at least equal (arguably greater) risk; "EU exposure" understates this. (4) Contract (Ryanair v PR Aviation) and footage/broadcast copyright remain

the dominant exposures ? and note the trap that the licence which legitimises ingestion is often the very instrument that contractually bans extraction/redistribution. Practical guardrail (strengthened): do NOT assume self-derivation defeats the database right; treat self-derived event/coordinate streams as potentially \"obtained\" data; avoid taking from any single rights-holder's match in a way that could reconstitute their dataset or harm their feed's monetisation; read every source's T&Cs for automated-extraction and redistribution clauses; get jurisdiction-specific (EU + UK) advice before redistributing derived numeric streams at scale; and keep the footage-copyright analysis strictly separate and front-of-mind for the highlight reels.",

{
  "questionKey": "india-law",
  "centralClaim": "Derived/scraped numerical data are uncopyrightable facts in India and the activity is \"lawful on its face, more permissive than the EU\": Indian copyright protects only original arrangement (EBC v D.B. Modak), there is no EU-style sui generis database right, DPDP covers only identifiable personal data (so anonymized numbers are out, with minors triggering s.9), and the only live risk is the scraping act under ToS + IT Act s.43 ? with OLG v Padawan allowing private use and ANI v OpenAI undecided.",
  "verdict": "qualified",
  "reasoning": "The core legal taxonomy survives scrutiny: facts as such are uncopyrightable, India has no sui generis database right, and DPDP is gated on identifiability of a natural person. But the confident bottom line (\"lawful on its face, more permissive than the EU\") is materially overstated on three fronts. (1) COPYRIGHT IS NOT AS CLEAN AS CLAIMED. EBC v D.B. Modak (2008 SC) adopted a 'skill and judgment' middle path but did NOT abolish low-threshold protection for COMPILATIONS/DATABASES. Indian High Courts repeatedly protect databases of facts as 'original literary works' under s.2(o) on a modest 'skill, labour and judgment' showing ? Burlington Home Shopping v Rajnish Chibber and V. Govindan v E.M. Gopalakrishna Kone, and critically the OLG order itself, which RULED scraped listings qualified as a protectable 'proprietary database.' So if the 'derived numbers' are extracted from a third party's structured database, copying that selection/arrangement can infringe even though the raw facts are free. The supporting finding also mischaracterizes OLG v Padawan: the case was decided AGAINST the scraper; the 'private use' line is obiter dictum, not a ruling that 'allowed private use.' (2) DPDP IS MORE CONTESTED THAN STATED. Anonymized numbers do fall outside DPDP, but the s.3(c)(ii) 'publicly available data' carve-out is NOT a settled safe harbour for non-anonymized personal data: MeitY (Minister Jitin Prasada) has publicly insisted scrapers 'must still comply with consent and other obligations under the DPDPA,' and the IAPP analysis flags that 'the statute and the government's stance simply do not align.' The s.9 children's regime is also stricter than 'consent + tracking ban' ? s.9(3) is a flat PROHIBITION on behavioural tracking AND targeted advertising of children, with only narrow Draft-Rule-11/Fourth-Schedule exemptions. (3) THE SCRAPING ACT RISK IS LIVE, NOT FACIALLY LAWFUL. The Government has affirmatively argued scraping public data 'may be in breach of section 43' of the IT Act; s.66 layers CRIMINAL exposure (up to 3 years / Rs 5 lakh). Indian courts have not yet ruled on enforceability of anti-scraping ToS, so contractual breach + IT Act liability are genuine untested risks rather than 'lawful on its face.' Finally, ANI v OpenAI is no longer merely 'undecided' ? the Delhi HC RESERVED judgment (approx April 2026); a ruling narrowing fair-dealing/TDM could land at any time. Net: the headline 'not copyrightable / lawful on its face / more permissive than the EU' is defensible only for genuinely anonymized, independently-derived aggregate numbers; it is unsafe advice as stated for scraping a third party's structured dataset, for any non-anonymized personal data, or where minors are involved.",
  "correctedClaim": "Aggregate numbers that are genuinely facts are not themselves copyrightable in India, India has no EU-style sui generis database right, and DPDP applies only to personal data of identifiable individuals ? so independently-derived, anonymized numbers are largely outside copyright and DPDP. BUT the activity is not unqualifiedly 'lawful on its face.' (a) If the numbers are lifted from a third party's structured database/compilation, Indian courts protect such compilations as 'original literary works' on a low 'skill, labour and judgment' threshold (Burlington; Govindan; and the OLG order itself, which held a scraped dataset protectable) ? so copying the selection/arrangement can infringe; the 'private use' remark in OLG v Padawan is obiter and the case was decided AGAINST the scraper. (b) The DPDP 'publicly available data' exemption (s.3(c)(ii)) is contested: MeitY has stated scrapers must still meet DPDPA consent obligations, and s.9(3) flatly prohibits behavioural tracking and targeted advertising of children. (c) The scraping ACT carries live, untested civil and criminal exposure ? breach of anti-scraping ToS plus IT Act s.43 (Government has invoked this) and s.66 (up to 3 years' imprisonment / Rs 5 lakh). (d) ANI v OpenAI judgment is RESERVED (approx April 2026) and could narrow fair-dealing/TDM. Bottom line: lawful only if (i) the numbers are independently derived rather than copying a third party's compilation structure, (ii) any personal data is truly anonymized and no minors are tracked, and (iii) anti-scraping ToS and IT Act exposure are accepted as unresolved risks ? not 'facially lawful.'",

  "questionKey": "contract-tos-tradesecret",
  "centralClaim": "Committing derived data is a contract problem independent of copyright whenever the data was obtained under an enforceable ToS barring scraping/extraction/redistribution: post-Van Buren platforms rely on contract because the CFAA no longer reaches purpose-violations of accessible/public data. Whether the ToS bites turns on (1) account/login/clickwrap assent (hiQ binds; logged-out browwrap-only per Meta v. Bright Data may not bind) and (2) the redistribution step (committing to a public repo) being the highest-risk act because most ToS independently bar \"distribute\"/commercial reuse. Conversely, owner-recorded footage has no third-party contract to breach, so the analysis flips to trade secret under 18 U.S.C. § 1839 ? secrecy + value-from-secrecy ? and publishing forfeits the moat. Net rule: third-party ToS-sourced derived data should NOT be committed publicly; owner-recorded derived data is the owner's to publish or protect, with only the trade-secret moat at stake.",
  "verdict": "qualified",
  "reasoning": "The core contract machinery is correct and well-sourced ? ToS is an enforceable contract that can bite where CFAA/copyright fail (hiQ's Nov 2022 breach-of-contract summary judgment + $500k consent judgment and injunction, after the CFAA route was foreclosed for public data), the clickwrap/browwrap and logged-in/logged-out distinctions are real (Meta v. Bright Data, Jan. 23, 2024, Judge Chen: Meta's Terms \"do not bar logged-off scraping of public data\"), and redistribution is genuinely the riskiest act. But the bottom line is over-confident in four ways that would get this client in trouble, so it must be QUALIFIED rather than accepted as stated.\n\n(1) VAN BUREN IS OVERREAD. The bottom line asserts \"the CFAA no

```

longer reaches mere purpose-violations\" as if the CFAA route is cleanly closed. Van Buren's footnote 8 EXPRESSLY RESERVED \"whether this inquiry turns only on technological (or 'code-based') limitations on access, or instead also looks to limits contained in contracts or policies.\" Commentators (Zwillgen, Cooley/CRS) caution against treating Van Buren as fully closing CFAA enforcement against scrapers who violate ToS; a contract/policy that \"applies to the scope of accessible information itself\" may still ground CFAA liability. So contract is the SAFER bet for platforms, but the federal-crime overlay is not as dead as the bottom line implies ? relevant because CFAA exposure (and its statutory damages/criminal posture) is categorically worse for the client than a breach claim.\n\n(2) THE OWNER-FOOTAGE \"FLIP\" IS THE WEAKEST CLAIM AND IS PARTLY REFUTED. \"When the corpus is the owner's OWN recordings... no third-party contract to breach\" is false for the most likely real-world case: footage SHOT BY THE OWNER AT A BADMINTON EVENT. A ticket is a contract of admission that routinely bars recording/redistribution without written permission, and event-organizer/venue/broadcaster rights (BWF/league terms, Rome Convention rebroadcast rights) attach independently. So owner-shot footage of someone else's event carries live contract AND third-party IP exposure that the \"flip\" waves away. The flip only truly holds for footage the owner shot of THEIR OWN private/non-ticketed sessions.\n\n(3) WRONG GOVERNING LAW FOR THIS CLIENT. The trade-secret analysis is built entirely on US law (18 U.S.C. § 1839 / DTSA). The client is Bangalore-based. India has NO trade-secret statute and NO DTSA ? protection runs through the Indian Contract Act 1872, equity, and the common-law action for breach of confidence (plus IT Act s.72 for electronic records). The two-prong DTSA test is not the operative rule; an Indian court applies breach-of-confidence doctrine. The publication-forfeits-the-moat intuition survives the jurisdiction change, but citing § 1839 as \"the\" rule is a jurisdictional error a skeptical reviewer must flag. Conversely, the platform ToS the client scrapes (YouTube etc.) typically carry US/California choice-of-law and could be litigated there ? so the contract exposure is real even though the trade-secret framing is mis-jurisdictioned.\n\n(4) THE ANALYSIS IGNORES TWO EXPOSURE ROUTES INDEPENDENT OF BOTH CONTRACT AND COPYRIGHT. (a) Personal-data/personality rights: a badminton clip dataset contains identifiable faces. YouTube's own ToS flags \"faces\" as identifying info, and publishing such a dataset implicates India's DPDP Act 2023 (facial data = personal data; consent-based) and personality/publicity rights ? exposure that exists even if every clip is non-copyrightable, fair use, AND no ToS binds. (b) Sui generis database right: in the EU, extraction/reutilization of a substantial part of an investment-heavy database is independently actionable regardless of copyright; a redistributed scraped dataset can infringe even if the underlying items are not works. The bottom line's \"copyright analysis won't catch it ? so it's a contract problem\" framing under-counts these.\n\nNUANCE on damages/remedy (does NOT undercut the bottom line, strengthens it): one might argue a breach claim yields only nominal damages so the contract risk is overstated. That argument FAILS ? the operative remedy in scraping disputes is INJUNCTION plus destruction-of-data orders (hiQ's consent judgment ordered destruction of all source code/data/algorithms derived from scraped profiles), which for a committed public dataset means forced takedown and deletion. So the redistribution-risk point stands and is arguably understated.\n\nCONTRACT-FORMATION refinement: \"any logged-in or account user = bound\" is slightly too categorical even for clickwrap ? courts in 2023-24 have refused to enforce poorly-presented \"sign-in wrap\" terms for lack of conspicuous notice / unambiguous assent. For a YouTube API key or an explicit \"I agree\" account signup the binding is firm; for thinner sign-in flows it is fact-specific.\n\nNet: the practical repo rule (don't publicly commit third-party-ToS-sourced derived data; treat owner-recorded data as the owner's to publish/protect) is DIRECTIONALLY SOUND and the right default. But it must be qualified ? Van Buren did not fully kill the CFAA, the owner-footage flip fails for ticketed/event footage, the trade-secret rule for an India-based client is breach-of-confidence not DTSA, and privacy/personality rights (DPDP) + EU database right are independent exposures the contract-vs-copyright dichotomy misses.

\"correctedClaim\": \"Committing third-party-sourced derived data can be a breach of contract independent of copyright where the data was obtained under an enforceable ToS ? and after Van Buren platforms lean on contract because the CFAA's reach over accessible/public data is narrowed (though Van Buren footnote 8 expressly RESERVED whether contract/policy limits can still ground CFAA liability, so the federal-crime route is narrowed, not eliminated). Whether the ToS binds turns on assent: a logged-in/account/API-key or genuine clickwrap \"I agree\" user is bound (hiQ ? breach-of-contract summary judgment, \$500k consent judgment, injunction and order to destroy scraped-derived data), whereas a purely logged-out scraper of public pages under a browwrap-only link may not be (Meta v. Bright Data). Even \"clickwrap\" is not automatic ? thin \"sign-in wrap\" flows fail for lack of conspicuous notice/assent. Redistribution (committing the dataset to a public repo) is the highest-risk act; the dominant remedy is injunction + forced deletion, not just nominal damages.\n\nThe \"owner's own recordings = no contract, only trade secret\" flip is only partly right. It holds for footage the owner shot of their OWN non-ticketed sessions. It does NOT hold for owner-shot footage of a

third party's badminton event: the admission ticket is a contract that typically bars recording/redistribution, and venue/organizer/broadcaster rights (BWF/league terms; Rome Convention) attach independently of any ToS. And the "trade secret" framing must use the CLIENT'S law: the client is in Bangalore, where there is no DTSA ? protection is via the Indian Contract Act 1872, equity, and common-law breach of confidence (IT Act s.72 for electronic records), not 18 U.S.C. § 1839; publication still forfeits the moat under that doctrine. Critically, the contract-vs-copyright frame misses two exposures that bite regardless of either: (a) personal-data/personality rights ? a face-containing badminton dataset implicates India's DPDP Act 2023 and publicity rights even if no ToS binds and every clip is non-copyrightable; and (b) the EU sui generis database right, which independently bars extraction/reutilization of a substantial part of an investment-heavy database. Net repo rule (sound as a DEFAULT, with the above qualifications): do not publicly commit third-party-ToS-sourced derived data; treat owner-recorded data as the owner's to publish/protect ? but clear ticket/venue/broadcaster terms for event footage, scrub or consent-base identifiable faces under DPDP before any public commit, and analyze "trade secret" under Indian breach-of-confidence law, not the DTSA.",

}
],
{
  "questionKey": "privacy-biometrics",
  "centralClaim": "Triage by what the stream is about and singling-out: shuttle coordinates =
inanimate, not personal data, publish freely (unless joined to identifying data); person
bounding boxes = ordinary personal data when they single out a human but NOT Art.9 unless used
to uniquely identify; pose/gait = danger zone (re-identifies even with faces blurred; raw tracks
not reliably anonymous; Art.9 special-category once used to uniquely identify). Practical:
shuttle = publish freely; detached bbox/pose coordinates for rally detection = OK with normal
hygiene; named player + gait/pose signature or face crop = no publish without explicit-consent
Art.9 basis. Minors flip everything: India DPDP (child = under 18) needs verifiable parental
consent (Rule 10), no detrimental effects, and s.9(3) flatly BANS tracking/behavioural
monitoring of children, which a persistent pose/gait signature arguably is.",
  "verdict": "qualified",
  "reasoning": "The triage framework is directionally sound and matches the project's
guardrails, but a skeptical review surfaces four over-confident statements and one omitted 2025
development. (1) \"Shuttle tracks = publish freely\" is too absolute: the findings' own WP136
content/purpose/result test and Recital 26 \"singling out\" mean that shuttle coordinates
published as part of an identifiable, named match are part of a personal-data processing
operation even though the coordinates alone describe an object ? \"freely\" holds only for
genuinely context-free coordinates. (2) The \"pseudonymized data is always personal data\"
framing relies on the superseded absolute reading of Recital 26; the CJEU appeal judgment EDPS v
SRB (Court of Justice, 4 September 2025, setting aside the General Court's 2023 decision) held
pseudonymised data is NOT necessarily personal for every recipient ? identifiability is
relative/recipient-specific (\"means reasonably likely,\" no \"disproportionate effort\"). This
cuts both ways: it can EXEMPT coordinates a recipient genuinely cannot relink, but the
transferor/controller still treats them as personal and recipient-disclosure/transparency duties
persist from the controller's viewpoint. (3) \"s.9(3) flatly BANS\" overstates the law: DPDP
Rules 2025 Rule 12 + Fourth Schedule create class- and purpose-based exemptions from both s.9(1)
and s.9(3) (healthcare, schools, day-care, child-transport; and real-time location tracking for
child safety). Those exemptions almost certainly do NOT rescue an amateur highlight indexer (so
the ban still bites this client), but \"flatly BANS, no exceptions\" is legally inaccurate.
Moreover \"tracking/behavioural monitoring\" is UNDEFINED in the Act and its breadth is
contested, so \"a persistent pose/gait signature arguably is behavioural monitoring\" is the
defensible CONSERVATIVE reading, not a certainty. (4) The Art.9 \"detect/categorize is fine\"
point (EDPB Guidelines 3/2019) is correct but fragile here: the product's value proposition
trends toward per-player tracking, and the moment pose tracks single out/follow a specific
player across rallies the purpose flips to unique identification and Art.9 attaches ? so \"pose
coordinates detached from identity = generally OK\" is true only under a condition this
architecture is prone to violate. The gait-anonymization research (Weiss et al. 2025) is
correctly cited and strengthens the pose-danger conclusion. Confidence on the DPDP s.9(3)-scope
and gait-as-monitoring conclusions is moderate because the primary statutory text and the
medianama scope article could not be fetched (403); those rest on secondary commentary.",
  "correctedClaim": "Keep the object/person/pose triage, but tighten four points. (a)
Shuttle/object coordinates are not personal data in isolation, but publishing them as part of
identifiable match footage does NOT escape the surrounding personal-data obligations ? \"publish
freely\" applies only to genuinely context-free coordinates, not coordinates tied to a named
match/players. (b) Drop the absolute \"pseudonymised = always personal data\" rule: post EDPS v
SRB (CJEU, 4 Sept 2025) identifiability is relative and recipient-specific, so detached
coordinates a recipient genuinely cannot relink may be non-personal in that recipient's hands ?
but you (the controller) still treat them as personal and owe transparency/recipient-disclosure
duties. (c) Replace \"s.9(3) flatly BANS\" with: s.9(3) prohibits tracking/behavioural
monitoring of children subject to Rule 12 / Fourth Schedule exemptions (which do not cover an
amateur highlight indexer, so the ban does apply to this client); note that
\"tracking/behavioural monitoring\" is undefined, so treating a persistent per-player pose/gait
signature as prohibited monitoring is the conservative, not the certain, reading. (d) Stress
that \"bbox/pose coordinates outside Art.9\" holds ONLY while the system does not single out a
specific player; per-player re-identification across rallies/videos flips the purpose to unique

```

identification and triggers Art.9. Practical ladder is otherwise sound: shuttle in isolation low-risk; truly identity-detached bbox/pose coordinates for rally detection OK with normal personal-data hygiene; named player + gait/pose signature or any face crop = do not publish without an explicit-consent Art.9 basis; for footage with minors, exclude them from any persisted derived stream beyond inanimate shuttle data, or obtain Rule-10 verifiable parental consent and keep only de-identified object/coordinate data.",

{
  "questionKey": "deidentification-reid",
  "centralClaim": "Non-attributability is a property of the (data, holder, environment) triple, not of the timeseries itself: under GDPR Recital 26 / Breyer / EDPB 01/2025, \"anonymous\" is a relative risk standard turning on whether re-identification is \"reasonably likely\" given the means realistically available to the holder. A per-video trajectory/feature stream is effectively a fingerprint (de Montjoye: 4 points -> 95%; k-anonymity collapses on rich quasi-identifiers), so a deterministic detector re-run enables a correlation attack ? but only against a correlatable reference. Hence the public/private split: PUBLIC source = a cheap permanent reference exists, re-linkage is reasonably likely, raw streams should be treated as attributable (need a release model that breaks correlatability per NIST SP 800-188); PRIVATE/unpublished source = no external reference, so source-linkage by an external adversary is not reasonably likely and \"strong non-attributability of the SOURCE is genuinely achievable... and is in fact the default,\" subject to caveats (conditional/revocable, protects the source-link not the human, and relative to the adversary's auxiliary data).",
  "verdict": "qualified",
```

"reasoning": "The legal scaffolding and the technical core hold up and are, if anything, REINFORCED by the newest authority the bottom line does not cite: CJEU EDPS v SRB (C-413/23 P, 4 Sept 2025) squarely adopts the contextual/relative approach ? \"pseudonymised data must not be regarded as constituting, in all cases and for every person, personal data\" ? confirming non-attributability is a property of the (data, holder, environment) tuple, exactly as claimed. Recital 26, Breyer's \"reasonably likely / not disproportionately difficult\" limb, WP216's singling-out/linkability/inference triad, ICO's motivated-intruder test, NIST SP 800-188's data-sharing-model framing, Sweeney's k-anonymity, and de Montjoye's 4-points->95% (independently verified via the MIT DSpace copy and multiple secondaries) all check out as cited. So the framework, the fingerprint/linkability characterisation, and the public-source conclusion (reference exists -> re-linkage reasonably likely -> treat as attributable; break correlatability to fix it) are well-supported.\n\nBut three things materially qualify the bottom line and would get a client into trouble if read at face value:\n\n(1) OVERSTATED \"DEFAULT ANONYMOUS\" FOR THE PRIVATE CASE. The single most dangerous sentence is that for a private/unpublished source, \"strong non-attributability of the SOURCE is genuinely achievable... and is in fact the default.\" The same SRB judgment that vindicates the relative approach ALSO holds that for the party holding the source/means ? here the owner who recorded the video and can re-run the same deterministic detector ? the data \"necessarily remained personal data\" and \"remains personal\" for whoever holds or could obtain the means to re-link (paras 76-77, 86). So the stream is NOT \"anonymous by default\"; in the owner's own hands it is personal data, full stop. It is only RELATIVELY non-attributable to a specific external adversary who lacks the source. Calling it \"anonymous\"/\"non-attributable\" as a default ? even hedged ? is precisely the GDPR-classification error the controller's-perspective holding exists to prevent. The bottom line's own caveat (\"a party that already holds the source file can always re-link\") concedes this, but the headline \"default\" framing contradicts the caveat.\n\n(2) THE FORWARD-LOOKING DATA ENVIRONMENT CUTS AGAINST \"NO REFERENCE TODAY = SAFE.\" OVIC's guidance states the auxiliary information available today \"is the absolute minimum that might be available to a determined attacker, now or in the future,\" and the ICO treats anonymisation as not a one-time exercise ? it must be re-assessed as new datasets emerge and techniques advance. The bottom line acknowledges revocability, but its \"in fact the default\" framing inverts the regulator's posture: regulators tell you to ASSUME the environment will grow, not to bank on the current absence of a reference. The private-source link is contingent and the burden is on the holder to keep checking.\n\n(3) NO LIGHT ASSUMPTION THAT THE ADVERSARY LACKS MEANS. SRB (per Skadden, Taylor Wessing) requires the discloser to CAREFULLY DOCUMENT the technical, organisational and legal measures preventing re-identification and to revisit them; \"could obtain\" means count. An over-confident \"private = anonymous\" reading skips that assessment. Note too that SRB was set aside and REMITTED, and it CORRECTED the General Court's recipient-only test by re-centring the controller's perspective for transparency duties ? so the strongest recent case both supports the relative approach and warns against the exact over-confidence at issue.\n\nOne source-confidence note: the specific feasibility figure \">75% of objects from week-long signatures\" (arXiv 2010.01516 / 2504.11949) could not be independently verified ? both PDFs failed to parse ? so that quantitative claim stays low/medium confidence; it is not load-bearing because the de Montjoye uniqueness result and the WP216/OVIC fingerprint-linkability framing already establish near-uniqueness of high-dimensional traces. Also \"deterministic detector re-run\" is somewhat optimistic about the attacker (codec/version/parameter drift makes real-world matches probabilistic, not bit-exact) ? but this strengthens, not weakens, the public-source conclusion (correlation alignment still works), and is irrelevant to the legal core.\n\nNet: the analysis is substantially correct and the public-source conclusion is solid, but the private-source bottom line is over-confident on two legally material points (it is personal data to the holder, never \"anonymous by default\"; and the no-reference-today basis is forward-looking and revocable, not a default). That is a material qualification, not a refutation ? hence \"qualified,\" consistent with the skeptical default given genuine doubt about the \"default anonymous\" phrasing.

\"correctedClaim\": \"Non-attributability is a property of the (data, holder, environment) triple, not of the timeseries itself ? and this relative, risk-based standard is now strengthened by the CJEU's newest ruling, EDPS v SRB (C-413/23 P, 4 Sept 2025): \"personal\" is not an absolute characteristic of data, and the same de-identified stream can be personal to one party yet non-attributable to another, judged by the \"means reasonably likely to be used\" by whoever holds it (Recital 26; Breyer's \"not disproportionately difficult in terms of time, cost and man-power\" limb; EDPB Guidelines 01/2025; ICO motivated-intruder test; WP216's singling-out/linkability/inference triad; NIST SP 800-188's release-model framing). Technically, a per-video trajectory/feature stream is a near-unique fingerprint (de Montjoye: four points uniquely identify 95% of 1.5M people, uniqueness decaying only ~1/10 power with coarsening; k-anonymity collapses toward k=1 on rich quasi-identifiers), so re-running a detector reproduces a correlatable stream that alignment can match ? but only against an existing, reasonably-

obtainable reference.\n\nPUBLIC source (broadcast/YouTube): a permanent, cheap reference exists; an adversary can re-run the detector on candidate videos and confirm the match (correlation, not bit-exact determinism, suffices). Re-linkage is \"reasonably likely,\" so raw streams should be treated as effectively attributable to their source; coarsening/feature-reduction mitigate but do not reliably eliminate this, and risk grows as more public video and better matchers appear. To achieve real source-non-attributability you must use a release model that breaks correlatability ? heavy aggregation, perturbation/differential privacy, synthetic data, or a non-public enclave (NIST SP 800-188). This conclusion is robust.\n\nPRIVATE/owner-recorded source, never published: there is no external reference to correlate against, so source-linkage by an EXTERNAL adversary who lacks the source is not \"reasonably likely.\" But it is wrong to call this \"anonymous by default.\" Three corrections: (a) To the holder/owner ? who recorded the video and can re-run the same detector to re-derive the stream ? the data is and remains PERSONAL DATA; SRB holds it \"necessarily remained personal data\" for the party holding the means, and \"remains personal\" for anyone who has or \"could obtain\" the means to re-link. So the correct claim is RELATIVE non-attributability to a specific external adversary lacking the source, never anonymity in the holder's own hands. (b) It is conditional, revocable, and forward-looking: regulators (ICO, OVIC) treat the data environment as expanding ? today's available auxiliary data is \"the absolute minimum that might be available... now or in the future\" ? so the holder must document the assessment and re-test it over time, not bank on the current absence of a reference; publish or leak the source and the link snaps back to \"reasonably likely.\" (c) It protects only the source-video link, not the human (a player identifiable through other auxiliary data is a separate inference/linkability question), and a party already holding the source file or its hash can always re-link. Practical upshot: do not classify a private per-video stream as \"anonymous\"; treat it as personal data in your own hands that is merely non-attributable to outside parties under documented, periodically-revisited conditions.

GROUNDING:

CODEBASE FACTS (verified by the lead before this run):

- eval_baselines/ is a TRACKED (committed) dir of JSON baseline snapshots (regression_baseline.json, heuristic_lovo_n6.json, gemini_wrapper_2026-06-10.json, experiment_leaderboard.json). Precedent: committed structured regression files already live in git.
 - backend/eval/regression.py loads a committed baseline, scores DB-stored predictions vs ground-truth intervals, flags P/R drop beyond tolerance, with incommensurability guards (IoU/detector/GT-hash). Predictions come from the DB (needs a pipeline run on the video) -> NOT video-free on the prediction side yet.
 - backend/eval/fusion_golden.py extracts *_golden_features.json from VIDEO+trajectory CSV+labels (needs GPU/WSL). backend/eval/fusion_compare.py & backend/eval/ablation.py RE-SCORE those JSON features on pure CPU with NO video (LOVO deltaF1, bootstrap CI, sign test). This is the EXISTING VIDEO-FREE seam.
 - docs/GOLDEN_DATA_SHARING.md (#175): *_golden_features.json are deliberately kept PRIVATE on OneDrive, OUT of git, because they derive from a 'Proprietary corpus.' Existing skipif litmus tests (tests/test_ablation.py::test_litmus_reproduces_gate_a, tests/test_fusion_compare.py) run ONLY if those features are present in output/ -> currently skipped everywhere.
 - Data contracts: trajectory CSV columns (Frame,Visibility,X,Y); candidate/final rally segments = (start,end) time intervals; multi-signal fusion uses shuttle + person + audio + court-bounds feature columns (weak signals retained, default-OFF). video_id = MD5 of the source file (backend/utils/hashing.py) ? i.e. using it as a public key would FINGERPRINT the source file.
 - Guardrails: commercial-clean licensing MIT/Apache/BSD only; paid LLMs never a training source; EXCLUDE MINORS from the training pool; gait/biometrics strictly FUTURE (GDPR Art 9). Owner is Bangalore/India-based; aims at commercialization and possibly co-authoring a research paper.
 - A SEPARATE workflow is concurrently designing the general video-free fixture mechanics. THIS effort focuses on (a) the LEGAL/IP/privacy status of committing DERIVED structured data PUBLICLY, and (b) a non-attributability + encryption ('secret file') architecture.
- GOAL: let an external contributor on another clone run the rally-segmentation regression suite from COMMITTED structured fixtures (no video present), such that the fixtures (i) cannot be attributed to a specific source video/match/person and (ii) are useless to a public user in isolation.
- KEY CONSTRAINT ALREADY ESTABLISHED BY THE LEAD: a contributor who RUNS the tests necessarily can read the plaintext fixtures + any key on their machine (DRM/analog-hole limit). So secrecy-from-contributor is impossible; the achievable goal is NON-ATTRIBUTABILITY + uselessness-in-isolation, plus encryption only as defense against the NO-KEY public.

2. assistant (2026-06-16T03:01:32.193Z)

I'll synthesize the research findings and skeptical verifications into a coherent memo. Let me first ground myself in the actual codebase facts that are relevant to the legal architecture before writing.

3. user (2026-06-16T03:01:32.928Z)

```
1      # Golden / GPU-Extractor Data Sharing ? GPU box ? dev sessions
2
3      **Status:** convention + plan (2026-06-15). Tracked in **#175**.
4      **Purpose:** a single cloud-synced location for the GPU-extracted golden artifacts
(trjectory CSVs, `_golden_features.json`, manifests, baseline snapshots) so the **GPU box**
and **CPU dev/agent sessions** share the same files ? without committing large data to git.
5
6      ## Why this exists
7      The rally-quality measurement is split across two machines by capability:
8      - **`backend/eval/fusion_golden.py`** (shuttle+person feature **extraction**) needs the
**videos**, the **trajectory CSVs**, the **`.rallies.csv` golden labels**, and a **GPU/WSL**
stack ? only the GPU box can run it.
9      - **`backend/eval/fusion_compare.py`** / **`backend/eval/ablation.py`** (the LOVO
**litmus**: ?F1, bootstrap CI, paired sign test) are **pure-CPU re-scoring** that read only the
small `_golden_features.json` ? any session (incl. a CPU dev container) can run them.
10
11     Today those artifacts sit in gitignored `output/` (per-machine) and scattered local
folders (`...\Annotation Setup\Collect\Trajectories\`, `...\Golden Labelled\`). Nothing syncs
them between machines, so a CPU session cannot see the GPU box's extraction. This wires that gap
with OneDrive.
12
13     ## Canonical shared folder
14     `%USERPROFILE%\OneDrive\rally-annotator\golden-data\` ?
`C:\Users\avidu\OneDrive\rally-annotator\golden-data\`
15
16     OneDrive is present + signed-in on both the GPU box and the dev machine under the same
account, so it auto-syncs. Layout (date/size-tagged so a re-extraction is a new folder, never an
overwrite):
17
18     ```
19     golden-data/
20         README.md
21         features/<corpus-tag>/          *_golden_features.json      (small ? the key shared
artifact)
22         trajectories/<corpus-tag>/      *_predict.csv / *_wasb.csv (medium ? reusable across
runs)
23         manifests/                     *_lovo_manifest.json
24         baselines/                     leaderboard / regression snapshots (or keep tracked in
eval_baselines/)
25     ```
26
27     `` = e.g. `2026-06-15-n6` (date + corpus size). **Do NOT** put raw videos
here (tens of GB) ? keep those local to the GPU box.
28
29     ## The GPU ? CPU workflow
30     1. **GPU box** (videos + CSVs + labels present):
31         ```
32         python -m backend.eval.fusion_golden --manifest <manifest> \
33             --out-dir "%USERPROFILE%\OneDrive\rally-annotator\golden-
data\features\2026-06-15-n6"
34         ```
35         (or extract to local `output/` then copy the `_golden_features.json` into the shared
folder).
36     2. OneDrive syncs the JSONs to the dev machine automatically (small files, seconds).
37     3. **CPU dev/agent session** points the analysis at the shared folder:
38         ```
39         python -m backend.eval.fusion_compare --features-dir "...golden-
data\features\2026-06-15-n6" --record
40         python -m backend.eval.ablation      --features-dir "...golden-
data\features\2026-06-15-n6" --granularity group
41         ```
42     ? real person-feature ?F1 / CI / sign test. Copy the JSONs into the repo's `output/`
to also light up the `skipif` golden-litmus tests
```

```
(`tests/test_ablation.py::test_litmus_reproduces_gate_a`, `tests/test_fusion_compare.py`).
43
44     ## Optional code ergonomics (in #175, not required)
45     - A `RALLY_GOLDEN_DIR` env var (default `output/`) honored by `fusion_golden` /
`fusion_compare` / `ablation` so neither machine hardcodes the path. (The CLI `--out-dir` /
`--features-dir` flags already make this a convention; the env var is just ergonomics.)
46     - A tiny `scripts/sync_golden.py` to copy `output/*_golden_features.json` ? the shared
folder.
47
48     ## Guardrails
49     - The shared folder lives outside the repo ? never committed. Keep `output/`
gitignored and do not symlink the shared folder into a tracked path.
50     - The features derive from the Proprietary corpus ? keep the OneDrive folder
private (no public share links).
51
52     See also: `docs/NEXT_STEPS.md` (the "Next-session pickup" anchor),
`docs/MULTI_SIGNAL_FUSION_PLAN.md` (P3), `docs/TRACKNET_WSL_SETUP.md` (the GPU/WSL detector
setup).

5. assistant (2026-06-16T03:01:39.777Z)

I have the codebase facts I need. The two key architectural facts are confirmed: ``eval_baselines/`` already commits structured JSON snapshots (precedent), and ``*_golden_features.json`` are deliberately kept private off-git because they derive from a "Proprietary corpus." Let me check one more grounding fact about the feature columns and `video_id` fingerprinting risk.

6. user (2026-06-16T03:01:41.964Z)

""""Pure-CPU LOVO comparison: shuttle-only vs shuttle+person learned fusion on the golden set.

The fusion-P3 measurement. Loads the per-video feature JSONs written by ``fusion_golden.py`` and runs the SHIPPED experiment harness (``experiment.compare``, honest leave-one-video-out) ? no new scoring/labeling math. The two variants differ ONLY by ``feature_names`` (the harness's designed seam): the person features are extra columns the learned LogisticRegression weights, so the held-out ?F1 is an honest answer to "does the person cue help?" ? not a hunch.

Run (no GPU):

```
python -m backend.eval.fusion_compare --features-dir output --record
```

```
from __future__ import annotations
```

```
import argparse
```

```
import glob
```

```

=== HASHING ===
```

```
""""Canonical file-identity hashing for the indexer.
```

``video_id`` is the MD5 of the **whole** video file. Historically each endpoint

(``backend/main.py``, ``run_eval.py``, ``scripts/run_phase3_eval.py``,

```
`scripts/run_process_and_stitch.py`)
defined its own `get_file_md5` with a different read-chunk size (64KB / 8KB / 1MB).
The hash values agreed (same bytes hashed), but the duplicated code was a footgun:
any future change to one copy would silently diverge the DB key.
```

```
This module is the single source of truth. Import `compute_video_id` everywhere a
video needs to be keyed.
"""
```

```
from __future__ import annotations
```

```
import hashlib
```

64 KB matches the value used by the live pipeline (backend/main.py) before this was centralized. The chunk size does not affect the resulting digest ? it only bounds memory use while streaming large files.

```
_CHUNK_SIZE = 65536
```

```
def compute_video_id(filepath: str) -> str:
    """Return the MD5 hex digest of the whole file ? the canonical video_id.

    Streams the file in fixed-size chunks so multi-gigabyte recordings never load
    into memory at once.
    """
    hasher = hashlib.md5()
    with open(filepath, "rb") as f:
        for chunk in iter(lambda: f.read(_CHUNK_SIZE), b''):
            hasher.update(chunk)
    return hasher.hexdigest()
```

7. assistant (2026-06-16T03:01:46.501Z)

I have all the grounding I need. The key architectural facts are confirmed:

- The feature JSON carries `name`, `candidates` (start/end intervals + shuttle/person feature columns), and `gts` (ground-truth intervals). The `name` field and any embedded `video\_id` (MD5 of the source file) are the fingerprinting/attribution vectors.
- `eval\_baselines/` is the committed-precedent path; `\*\_golden\_features.json` are the proprietary-corpus artifacts currently kept off-git.

Now I'll synthesize the full memo and return it via StructuredOutput.

8. user (2026-06-16T03:05:36.873Z)

Structured output provided successfully

9. assistant (2026-06-16T03:05:55.297Z)

Memo delivered via StructuredOutput. Summary of what I produced and the grounding behind it:

****The synthesized memo's spine:**** The derived numeric data does not inherit the video's copyright in any of the three jurisdictions (the one settled point) ? but copyright is the easy axis, and the real exposure lives in four other places: the extraction act (now-contested US fair use), contract/ToS, the EU/UK sui generis database right, and privacy. The analysis forks on data provenance (owned/permissioned = Fork A, committable; third-party-sourced = Fork B, not committable), splits by jurisdiction (India primary, US, EU/UK), and gives concrete testable conditions plus a no-publish stream list (person/pose/gait/face/minors).

****Where I integrated the skeptical verifications**** (these were the load-bearing corrections that prevented an over-confident memo):

- US fair use for extraction reframed from "strongly favorable" to contested (Thomson Reuters v.

Ross 2025, USCO May-2025, Bartz v. Anthropic).

- EU "we created it" premise flagged as genuinely contestable (Football Dataco v. Sportradar "obtained" reasoning + CV-Online Latvia harm test + UK divergence).
- India "lawful on its face" downgraded (Indian compilation copyright on a low threshold, OLG decided against the scraper, contested s.3(c)(ii) carve-out, IT Act s.43/s.66).
- Owner-footage "flip" narrowed (ticketed-event footage carries live contract exposure; trade-secret framing corrected from DTSA to Indian breach-of-confidence).
- Privacy "pseudonymised = always personal" and "private = anonymous by default" both corrected via EDPS v. SRB (CJEU 2025).

****Codebase grounding that shaped the engineering conditions**** (relevant file paths, all absolute):

- `C:\Users\avidu\Projects\badminton-highlight-indexer\docs\GOLDEN\_DATA\_SHARING.md` ? confirms `\*\_golden\_features.json` are deliberately kept private because they derive from a "Proprietary corpus."
- `C:\Users\avidu\Projects\badminton-highlight-indexer\eval\_baselines\` ? confirms committed structured-JSON precedent already exists in git.
- `C:\Users\avidu\Projects\badminton-highlight-indexer\backend\eval\fusion\_compare.py` ? the feature JSON carries a `name` field plus per-candidate intervals + shuttle/person feature columns + `gts`; the `name`/source-attribution fields are the de-attribution target.
- `C:\Users\avidu\Projects\badminton-highlight-indexer\backend\utils\hashing.py` ? `compute\_video\_id` is the MD5 of the whole source file, which is why I flagged committing `video\_id` as a fingerprinting/source-confirmation leak that must be replaced with an opaque surrogate.

All citations in the memo are drawn only from the findings/verifications provided; none were invented.
