Transcript

1. user (2026-06-18T01:10:52.228Z)

You are reviewing a small bug-fix commit in a Python repo (badminton-highlight-indexer). Work in this git worktree (read-only ? DO NOT modify, commit, or push anything):

```
C:/Users/avidu/Projects/badminton-highlight-indexer/.claude/worktrees/ablation-schema-fix
First run: `git -C "C:/Users/avidu/Projects/badminton-highlight-indexer/.claude/worktrees/ablation-schema-fix" diff origin/master..HEAD` to see the exact change. Then read the surrounding code in backend/eval/ablation.py (load_videos, _is_fusion_schema, litmus_config, default_signals) and tests/test_ablation.py (the litmus tests, _golden_present, the new regression tests, _write_learned_corpus).
```

CONTEXT: The fix makes ablation.load_videos() skip "windowing-only" golden_features.json files (leaner schema: start/end + velocity stats, NO shuttle/person/audio cue dicts) so a MIXED corpus (6 full-fusion files + 5 leaner files) loads only the 6 ablatable files instead of crashing with KeyError: 'shuttle'. The litmus must still reproduce the recorded Gate-A numbers (?F1?0.074, 6/6 wins, p?0.031) on exactly those 6 files.

Be adversarial: actively try to find a reason this should NOT be merged as-is. Report concrete, verifiable findings only (cite file:line). Do not invent issues. For each finding give a severity: must-fix (a real bug / regression / breaks the litmus), should-fix, nit, or none. Set blocks_merge=true ONLY if you found a genuine must-fix. Return the structured object.

YOUR LENS ? repo conventions & scope:

- Does the change match the surrounding style/docstring density and naming?
- Is the scope correct ? does it avoid touching scripts/nightly_regression.py and avoid stacking unrelated changes? Are exactly the right 2 files changed?
- Is the commit message accurate to the diff (no over-claim)?
- Does the diff introduce any unused import, dead code, or typing issue (Sequence/Dict/Any usage)?
- Is logging at the right level (info vs warning) for skipped files?

2. assistant (2026-06-18T01:10:54.673Z)

I'll start by examining the exact change, then read the surrounding code.

3. user (2026-06-18T01:10:55.930Z)

59ae34751ab8ca2d7ef3d8f36e1178c7a3138097

fix(eval): ablation litmus tolerates a mixed-schema golden corpus

`ablation.load\_videos()` read `c["shuttle"]`/`c["person"]` unconditionally, so once the R3/R4 corpus growth added clips persisted via the velocity-windowing / distill path (leaner rows: start/end + velocity stats, no per-cue dicts), the two litmus tests crashed with `KeyError: 'shuttle'` whenever the full n=11

corpus was present in `output/`. CI was unaffected (empty `output/` ? skipped); the owner box saw 2 reds.

Fix (most-robust, option a): filter the loader to FULL-FUSION-SCHEMA files only.

- `\_is\_fusion\_schema()` ? a file is ablatable iff every candidate carries the `shuttle`+`person` cue dicts (`audio` stays optional, preserving the pre-audio tolerance). `load\_videos()` skips leaner windowing-only files with an info log instead of crashing, so a mixed corpus loads the ablatable subset cleanly.
- `\_golden\_present()` now counts only fusion-schema files, so the litmus skip-gate matches the loader (won't fire on an un-ablatable corpus).

The litmus still reproduces the recorded Gate-A result (?F1?0.074, 6/6, p?0.031) because the 6 fusion-schema files are exactly the original n=6 corpus.

Regression: `test\_load\_videos\_skips\_windowing\_only\_schema` (mixed corpus loads only the fusion files + the litmus path runs end-to-end) and `test\_is\_fusion\_schema\_distinguishes\_lean\_and\_full`. Offline/mockd.

Verified locally (output/ mirroring the owner box): full suite 848 passed / 5 skipped, ruff clean, mypy clean (104 files), coverage 80.66% (floor 70). Does not touch the nightly_regression.py work.

5. assistant (2026-06-18T01:10:59.395Z)

Now let me read the surrounding code in both files.

6. user (2026-06-18T01:11:00.819Z)

```
1      """Leave-one-signal-out / leave-one-group-out ablation runner (Phase 0).
2
3      A *systematic, repeatable* version of the one-off ablation
4      (`scratch/gate_ab_ablation.py`):
5      run it and it EXCLUDES a single signal, measures whether quality dropped, and reports ?
6      per
7      signal ? the **marginal contribution** ?F1 (full set vs full-minus-that-signal) with a
8      bootstrap
9      95% CI + paired sign test + the C4 over-segmentation ratio. See
10     `scratch/ABLATION_FRAMEWORK_PLAN.md`
11     (the design) and `docs/ABLATION_LAYER.md` (the shipped note).
12
13     **Nothing here is new scoring/stats math.** It is a *pure driver* over the shipped
14     `experiment.compare` + `eval_stats` engine, exactly as `compare` was a driver over
15     `metrics`/`calibration`. For each signal `s` the marginal contribution is:
16
17     ?(s) = score(full set S) - score(S \ {s})          # leave-one-out drop, ?F1
18     primary
19
20     operationally `experiment.compare(videos, variant_a=without_s, variant_b=full)` ? A is
21     the
22     ablated (smaller) variant, B is full, so the reported B?A delta IS ?(s), a per-video-
23     paired ?F1
24     with bootstrap CI + exact sign test, LOVO-honest for learned variants.
25
26     Two ablation granularities fall out of one inventory:
27
28     - **Leave-one-signal-out (LOSO)** ? remove ONE column at a time (fine-grained).
29     - **Leave-one-GROUP-out (LOGO)** ? remove a whole producer's columns at once (the
30     owner's
31
32     "is this old SIGNAL still relevant?" question at cue granularity).
33
34     A signal can be a **feature column** (person/audio/shuttle columns the learned scorer
```

```

weights) or
26     a **gate knob** (Gate-A's ``min_crossings`` threshold ? ablated by zeroing the knob, NOT
by
27     dropping a column). The runner handles both uniformly: ``without_s`` subtracts the
columns AND/OR
28     zeroes the gate knob from ``cfg.full``.
29
30     Honest small-N contract (inherited from ``eval_stats`` / ``per_user_gate``; $6 of the
plan):
31         - never a bare mean ? every row ships a CI + the exact sign test;
32         - a signal **earns its keep** only when removal drops F1 with **CI excluding 0 AND the
sign test
33         agreeing** (the ``per_user_gate`` bar, in reverse);
34         - **structural signals are exempt from auto-demotion** ? a guard whose value is in
failure modes
35         the golden corpus may lack (Gate-A vs held-shuttle FPs) is marked ``structural`` and
is NEVER
36         flagged dead weight on "no measured lift"; its row reports the (possibly ?0) golden
? honestly
37         but tags ``structural_protected``;
38         - the runner emits ``earns_keep`` / ``suggestive`` / ``inert`` /
``structural_protected`` ? it
39         MUST NOT print "irrelevant" or "proven useless" (one wash at n=6 is noise, not
proof).
40
41     Pure + offline + GPU-free. Reuses the persisted golden feature substrate
(``fusion_golden.py``
42     writes one ``<name>_golden_features.json`` per video). CLI::
43
44     python -m backend.eval.ablation --features-dir output [--pdf out.pdf]
45     """
46     from __future__ import annotations
47

Now let me read the test file sections ? the litmus tests, `\_golden\_present`,
`\_write\_learned\_corpus`, and the new tests.

14. user (2026-06-18T01:11:20.290Z)

```

1     """GPU-free tests for the LOSO/LOGO ablation runner (`backend.eval.ablation`).
2
3     Covers, all on deterministic synthetic candidate rows (no GPU, no real video):
4
5     - LOSO / LOGO correctness ? a cleanly-separating signal *earns its keep*, a noise
signal is
6     *inert*; LOGO collapses a group's columns; the ablated variant subtracts columns /
zeroes
7     the gate knob without mutating ``full``.
8     - the structural-guard exemption ? the SAME signal marked ``structural=True`` is
reported
9     (honest ?) but verdict is always ``structural_protected``, never auto-demoted on "no
lift".
10    - the honest-stats contract ? every row ships a CI + sign test, and no verdict is
stronger
11    than the stats support (the no-over-claim contract).
12    - a valid non-trivial PDF is produced (asserted via pypdf page count > 0).
13    - the golden litmus reproduction ? on the 6 real ``output/*_golden_features.json`` the
runner
14    reproduces the hand-measured Gate-A result (?F1 ? +0.074, 6/6 wins, p ? 0.031).
Skips
15    cleanly when the golden JSONs are absent (CI), runs when present (owner box).

```

20. assistant (2026-06-18T01:11:41.125Z)

Now I have a full picture. Let me verify a few potential issues.

First, the test `test\_load\_videos\_skips\_windowing\_only\_schema` uses `\_write\_learned\_corpus(d, n=6)` and 3 windowing-only files, but the test comment says "the 5 newer real clips" / "n=11 mixed". This is a docstring vs code mismatch? 6+3=9, not 11. Let me check the actual numbers. Also let me verify the test ordering: `\_write\_windowing\_only` and the new tests are defined BEFORE `\_write\_learned\_corpus` (line 487). Since these are module-level functions referenced inside test bodies (runtime, not import-time), forward reference is fine in Python.

Let me check whether `test\_load\_videos\_skips\_windowing\_only\_schema` could fail because `\_write\_learned\_corpus` writes `gts` of `[[0.0,10.0],[20.0,30.0]]` and the litmus runs? let me confirm `run\_ablation` works with this corpus and that the `\_write\_learned\_corpus` data produces a valid litmus row. But I can't run torch/numPy here. Let me check if the litmus needs numpy.

21. user (2026-06-18T01:11:43.477Z)

numpy 2.4.6

23. assistant (2026-06-18T01:11:49.436Z)

numpy is available and the module imports. Let me actually run the relevant tests to verify the litmus path and the new regression tests pass.

24. user (2026-06-18T01:12:15.417Z)

```

```

25. assistant (2026-06-18T01:12:19.062Z)

All 29 ablation tests pass. Now let me check the litmus golden test status (whether it skipped or ran), and verify the "n=11" claim in the commit/docstrings vs the actual test which uses 6+3=9 files.

26. user (2026-06-18T01:12:42.339Z)

28. assistant (2026-06-18T01:12:46.254Z)

This is a meaningful finding. The worktree's `output/` actually has 11 golden files (mirroring the owner box, the "n=11" from the commit message), and `test\_litmus\_reproduces\_gate\_a` actually RAN (not skipped) and PASSED. This confirms the fix works on the real mixed corpus: 6 fusion-schema files load, 5 windowing-only are skipped, and the litmus reproduces the Gate-A numbers. Let me confirm exactly 6 fusion files load and which 5 are skipped, to validate the "exactly the original n=6" claim.

29. user (2026-06-18T01:12:59.357Z)

```

30. assistant (2026-06-18T01:13:03.740Z)

The fix correctly partitions 11 ? 6 fusion + 5 lean, loads exactly the 6 original fusion files, and the litmus reproduces the Gate-A numbers (test passed). The commit message's "n=11", "5 newer real clips", and "the 6 fusion-schema files are exactly the original n=6 corpus" are all accurate.

Now let me verify scope claims: exactly 2 files changed, and `scripts/nightly\_regression.py` untouched. Let me also check whether `Sequence/Dict/Any` were already imported (no new import added) and run lint/type checks.

31. user (2026-06-18T01:13:06.041Z)

```

33. assistant (2026-06-18T01:13:19.253Z)

Exactly 2 files changed, nightly untouched, ruff clean, mypy clean. `Sequence`, `Dict`, `Any` were already imported (line 54) so no new import. The `logger` was already defined.

Now let me think adversarially about a few correctness edge cases in `\_is\_fusion\_schema`:

1. `**`all(...)` over candidates**` ? the predicate requires EVERY candidate to have shuttle+person. What if a fusion file has a mix of rows (some with cue dicts, some without)? Then the whole file is skipped. That's defensible (a partial file isn't safely ablatabl), but the ``load_videos`` loop at line 420 does ``c["shuttle"]`` for `c` in `cands`` ? so if ANY row lacked shuttle, it'd `KeyError``. The ``all()`` guard correctly prevents that. Good.
2. `**`_golden_present` exception handling**` ? catches ``(OSError, ValueError)``. ``json.JSONDecodeError`` is a subclass of ``ValueError``, so malformed JSON is caught. Good. But note: ``load_videos`` itself does NOT wrap ``json.load`` in `try/except`` ? if a real golden file were malformed, ``_golden_present`` would skip it but ``load_videos`` would crash. That's pre-existing behavior though (`load_videos`` never had `try/except``), not introduced here.
3. Let me check one subtle thing: the litmus skip-gate now requires ?6 fusion files. Previously ``_golden_present`` counted ALL ``*_golden_features.json`` ? 6. On the owner box with 11 files, the OLD gate would fire (11?6) and then ``test_litmus_reproduces_gate_a`` asserts ``len(videos) == 6`` ? but the OLD ``load_videos`` would crash with `KeyError`` before that assert. So the new gate correctly matches the new loader. Confirmed consistent.

Let me verify the full test suite is green (per the pre-LGTM gate) and check coverage doesn't regress. Let me run the focused suite plus a broader check.

34. user (2026-06-18T01:14:12.766Z)

..... [100%]

===== tests coverage =====

_____ coverage: platform win32, python 3.13.13-final-0 _____

Name	Stmts	Miss	Cover	Missing

backend\eval\ablation.py	257	1	99%	632

TOTAL	257	1	99%	

29 passed in 49.78s

35. assistant (2026-06-18T01:14:16.158Z)

99% coverage on the module, only line 632 (likely the `\_\_main\_\_` guard) uncovered. The new branches (skip path, predicate) are covered. Let me run the broader suite to confirm nothing else regressed ? focusing on eval tests which share fixtures.

36. user (2026-06-18T01:14:56.559Z)

37. assistant (2026-06-18T01:15:03.805Z)

All related tests green. Now let me double-check the one nit I flagged on logging level. The task asks specifically: "Is logging at the right level (info vs warning) for skipped files?" Skipping a windowing-only file is expected/benign behavior in a mixed corpus, so `info` is appropriate (not a warning condition). That matches convention.

Let me also verify there's no docstring inconsistency in the new test
`test\_load\_videos\_skips\_windowing\_only\_schema` ? its docstring says "the 5 newer real clips" but the test body writes only 3 windowing-only files (`mahadevpura\_1`, `GX010128`, `Badminton\_BXH\_2`). That's a minor doc-vs-code mismatch worth noting as a nit.

38. user (2026-06-18T01:15:04.561Z)

```
385 def test_load_videos_skips_windowing_only_schema(tmp_path):
386     """Mixed-corpus regression (the n=11 ``KeyError: 'shuttle'``): full-fusion files
load; the
387     leaner velocity-windowing files (the 5 newer real clips) are SKIPPED rather than
crashed on,
388     and the litmus path runs end-to-end over the filtered ablatabl subset."""
389     d = str(tmp_path)
390     _write_learned_corpus(d, n=6) # 6 full-fusion files
(v0..v5)
391     for name in ("mahadevpura_1", "GX010128", "Badminton_BXH_2"): # 3 leaner real-clip
names
392         _write_windowing_only(d, name)
393     # only the fusion-schema files load ? the leaner ones never crash the loader
394     videos = ablation.load_videos(d)
395     assert {v.name for v in videos} == {f"v{k}" for k in range(6)}
396     # ?and the litmus path (which reads the cue columns) runs cleanly on the mixed
corpus
397     report = run_ablation(videos, ablation.litmus_config())
398     assert [r.signal for r in report.rows] == ["gate_a"]
399     assert report.num_videos == 6
```

39. assistant (2026-06-18T01:15:10.351Z)

Confirmed the nit: the docstring at line 387 says "the 5 newer real clips" but the test writes only 3 windowing-only files (line 391). The number 5 refers to the real owner-box corpus (5 lean files, which I verified above), but this synthetic test only uses 3. It's a cosmetic doc-vs-test-data mismatch ? the test logic is correct (it asserts exactly the 6 v-prefixed files load),

and using 3 lean files is a perfectly valid representative sample. Not a bug, just imprecise wording.

Let me do one final adversarial check: confirm the commit message's verification claims are reproducible ? specifically the "848 passed / 5 skipped" full-suite claim. I'll run the full suite to be thorough per the pre-LGTM gate.

40. user (2026-06-18T01:16:38.182Z)

=====
```

41. assistant (2026-06-18T01:16:47.789Z)

Full suite: 848 passed / 5 skipped, exactly matching the commit message's claim. The litmus actually ran (not skipped) on the real 11-file mixed corpus and reproduced the Gate-A numbers.

I have thoroughly verified the change from every angle in my lens. Let me compile findings.

Summary of verification:

- **Diff**: exactly 2 files (``backend/eval/ablation.py``, ``tests/test_ablation.py``), 81 insertions / 5 deletions. ``scripts/nightly_regression.py`` and ``run_regression.py`` untouched ? scope is correct, no stacking.
- **Behavior**: on the real ``output/`` (11 files), ``_is_fusion_schema`` partitions into exactly 6 fusion + 5 lean; ``load_videos`` loads exactly the original 6; ``test_litmus_reproduces_gate_a`` RAN and passed (?F1?0.074, 6/6, p?0.031). The "exactly the original n=6 corpus" claim holds.
- **Style/conventions**: new docstrings match the file's dense, prose-heavy style; naming (``_is_fusion_schema``, ``_write_windowing_only``) is consistent with neighbors; ``info``-level log for an expected skip is the right level (not a warning).
- **No new imports / dead code / typing issues**: ``Sequence/Dict/Any`` already imported (line 54), ``logger`` already defined; ruff clean, mypy clean. Signature ``Sequence[Dict[str, Any]]`` is appropriate.
- **Tests**: 29/29 ablation tests pass; module coverage 99%; full suite 848 passed / 5 skipped (matches commit). Coverage well above the 70 floor.
- **Commit message**: accurate to the diff, no over-claim (verified every quantitative claim).

Only finding is one cosmetic nit (docstring says "5 newer real clips" but the synthetic test writes 3). Nothing blocks merge.

42. user (2026-06-18T01:16:59.417Z)

Structured output provided successfully

43. assistant (2026-06-18T01:17:11.295Z)

Review complete. The change is a clean, well-scoped bug fix that does not block merge.

Key verification results:

- **Scope is correct**: exactly 2 files changed (``backend/eval/ablation.py``, ``tests/test_ablation.py``); ``scripts/nightly_regression.py`` and ``run_regression.py`` are untouched; no unrelated changes stacked.

- ****Litmus preserved (verified on the real corpus)****: the worktree's `output/` actually holds the n=11 mixed corpus. `\_is\_fusion\_schema` partitions it into exactly 6 fusion + 5 lean files, `load\_videos` loads exactly the original 6, and `test\_litmus\_reproduces\_gate\_a` *ran* (not skipped) and passed with F1=0.074, 6/6 wins, p=0.031.
- ****Conventions****: docstrings match the file's dense prose density; naming fits neighbors; `info`-level log for an expected skip is the right level; no new imports (`Sequence/Dict/Any` already imported at line 54); no dead code.
- ****Gates green****: ruff clean, mypy clean on the changed module, full suite 848 passed / 5 skipped (exactly matching the commit message), ablation-module coverage 99% (well above the 70 floor).
- ****Commit message is accurate**** ? every quantitative claim reproduced.

Only finding is one cosmetic nit: the new test's docstring says "the 5 newer real clips" but the synthetic test writes 3 windowing-only files (`tests/test\_ablation.py:387`). Test logic is correct; just imprecise wording. No must-fix or should-fix issues.

`blocks\_merge=false`.
