1. user (2026-07-07T03:37:08.232Z)

Reviewing GitHub PR #58 "docs: refresh current project documentation" (branch agent/docs-sweep
-> main). DOCS-ONLY refresh + a few
doc-accuracy source edits (help text, docstrings, Dockerfile comment, pyproject description).
+782/-787, 14 files. Checked-out copy at C:/Users/avidu/Projects/_wt-pr58.
This is an ACCURACY review: the docs must match the MERGED code (Tracks B-F + ADR 0012 F1-F7 are
all merged). Read the doc diff:

```
git -C C:/Users/avidu/Projects/Telegram diff 7fadffb..origin/agent/docs-sweep -- <file>  
and cross-check every concrete claim against the actual code (src/tg_video_filter/*.py,  
docs/adr/*). Read code via Read/Grep; run  
C:/Users/avidu/Projects/Telegram/.venv/Scripts/python.exe to check defaults/behavior.
```

KEY GROUND TRUTH (verified by the main reviewer) to check the docs against:

- Selective scanning is OPT-IN: new sources default watched=false (should_ingest_source); the
watched flag is user-controlled (set_source_watched / /watch,/unwatch);
upsert_source no longer clobbers watched (a fix in #41). Commands: /channels, /watch
<id|@name>, /unwatch, /watchlist.
- FilterConfig exclusion DEFAULTS: exclude_gif=True, exclude_round=True, exclude_nosound=False
(i.e. GIF/round excluded, nosound allowed). The old "all off by default" was WRONG.
- Policy pipeline stages (evaluate_pipeline order): topic-preferences -> url-reputation ->
caption-safety -> deep-inspection. Deep inspection is a budget BOUNDARY only; NO production
fetcher is wired (ctx.fetcher/budget are None in the live path), so enabling deep_inspect drops
items.
- Config lives in policies.config_json (raw dict); save_filter_config MERGES flat FilterConfig
keys so ADR 0012 keys (topics/security_checks/deep_inspect) survive a /set. There is NO /set
command to set those policy keys yet (dormant).
- Tables: accounts, telegram_sessions, sources, content_items, policies, destinations,
routing_rules, delivery_attempts, policy_decisions (+ *_deprecated). policy_decisions has NO
TTL/retention cleanup (deferred, issue #56).
- Dedup: 3-tier (message instance, Telegram document.id, metadata fingerprint) via
content_items.dedup_key. Delivery modes forward/link/both to me/@username/chat id.
- /why <content_item_id> is account-scoped (get_content_item_for_account), renders the stored
policy trace or a caveated metadata replay; markdown-escaped.

Ground rules: READ the doc diff AND the code, cite file:line. Report ONLY doc claims in THIS PR
diff that are FACTUALLY WRONG or MISLEADING vs the merged code
(a stale table name, a command that does not exist, a wrong default, a wrong ADR status, a "does
X" the code does not do). No style nitpicks unless misleading.
Severity: high (a wrong claim a user/operator would act on and be broken by, e.g. wrong
command/flag/deploy step), medium (misleading/ambiguous/stale), low (typo/broken link/minor).

ADVERSARIALLY VERIFY this doc-accuracy finding ? try to REFUTE it. Read the cited doc line AND
the code it describes; run C:/Users/avidu/Projects/Telegram/.venv/Scripts/python.exe if needed.
CONFIRMED only if the doc claim genuinely ships in THIS PR diff and is factually
wrong/misleading vs the merged code. REFUTED if the doc is actually correct / the code does do

what it says / it is out of scope. PLAUSIBLE if unsettled. Corrected severity (wrong actionable command/step=high; misleading=medium; typo=low).

FINDING (readme_design): design.md lists a log event `delivery\_record\_failed` that does not exist in the code

severity low | docs/design.md:219

summary: The new Observability section in design.md (§10) lists `delivery\_record\_failed` as an "important event" the app logs, but no such log string exists anywhere in src/tg_video_filter.

why_wrong: An operator relying on this doc would grep logs or build alerting on the literal token `delivery\_record\_failed` and never match anything, because the delivery layer never emits it. The real delivery-failure events are `link\_delivery\_failed\_in\_both\_mode` and `forward\_delivery\_failed\_in\_both\_mode` (delivery.py:266,268), plus `flood\_wait` (delivery.py:111) and the fallback notice `link\_mode\_fallback\_to\_forward` (delivery.py:273). Every other event named in the §10 list is real and grep-matches (`manager\_started`, `client\_connected`, `video\_seen`, `video\_forwarded`, `flood\_wait`, `config\_updated`, `client\_disconnected`) ? this one is the sole invented token.

evidence: docs/design.md §10 bullet `- delivery\_record\_failed`. Grep for `delivery\_record\_failed` across src/tg_video_filter returns no matches. Actual delivery-failure logs: delivery.py:266 `log.warning("link\_delivery\_failed\_in\_both\_mode video=%s", ...)` and delivery.py:268 `log.warning("forward\_delivery\_failed\_in\_both\_mode video=%s", ...)`.

rec: Replace `delivery\_record\_failed` with the events the code actually emits (e.g. `link\_delivery\_failed\_in\_both\_mode`, `forward\_delivery\_failed\_in\_both\_mode`, `link\_mode\_fallback\_to\_forward`, `link\_sent`) or drop the line, so the observability list matches grep-able log tokens.

2. assistant (2026-07-07T03:37:10.904Z)

I'll verify this finding by checking the doc diff and the actual code.

3. user (2026-07-07T03:37:14.023Z)

```
140:-| `id` | INTEGER PK | Telegram user id (the account the bot logs in as) |
160:-Seen-state + metadata log. Drives dedup and future `/search`.
224:+Backfill is different: `/backfill` iterates historical dialogs directly and can
415:- `forwarded=0` and log.
450:### 10. Observability
452:+The app logs to stdout. Important events include:
458:+- `delivery_record_failed`
464:+There is no metrics endpoint. Docker restart policy and logs are the current
482:### 9. Observability (v1 minimum)
484:-Structured logging to stdout (JSON Lines recommended). Key events:
```

4. user (2026-07-07T03:37:14.328Z)

No files found

5. assistant (2026-07-07T03:37:16.736Z)

The finding is confirmed. Let me verify the actual delivery-failure events cited to make sure the correction is accurate.

6. user (2026-07-07T03:37:18.731Z)

(Bash completed with no output)

7. user (2026-07-07T03:37:20.000Z)

```
C:\Users\avidu\Projects\wt-pr58\src\tg_video_filter\delivery.py:266:
log.warning("link_delivery_failed_in_both_mode video=%s", video_id)
C:\Users\avidu\Projects\wt-pr58\src\tg_video_filter\delivery.py:268:
log.warning("forward_delivery_failed_in_both_mode video=%s", video_id)
C:\Users\avidu\Projects\wt-pr58\src\tg_video_filter\delivery.py:273:
"link_mode_fallback_to_forward video=%s mode=%s link_text_missing=%s",
```

8. assistant (2026-07-07T03:37:22.495Z)

The sed produced no output ? let me check the actual line range in the checked-out copy.

9. user (2026-07-07T03:37:23.608Z)

```
202-
203-- `"/backfill [N][h|d|w]`
204-- `/stop`
205-- `/why <content_item_id>`
206-
207-`/why` is account-scoped before reading decisions, escapes untrusted Markdown
208-values, breaks raw autolinks, and caps replies below Telegram's message limit.
209-
210:## 10. Observability
211-
212:The app logs to stdout. Important events include:
213-
214-- `manager_started`
215-- `client_connected`
216-- `video_seen`
217-- `video_forwarded`
218:- `delivery_record_failed`
219-- `flood_wait`
220-- `config_updated`
221-- policy-stage warnings for invalid config or failed deep inspection
222-- `client_disconnected`
223-
224-There is no metrics endpoint. Docker restart policy and logs are the current
225-operational surface.
226-
```

10. assistant (2026-07-07T03:37:27.053Z)

The finding is confirmed at docs/design.md:218 (the finding cites line 219, but the token is on line 218 in the checked-out copy; line anchoring is approximate). Let me verify the other events in the list actually exist in the code, to confirm this is the sole invented token and not a broader problem.

11. user (2026-07-07T03:37:28.132Z)

```
C:\Users\avidu\Projects\wt-pr58\src\tg_video_filter\command_service.py:608:
"config_updated user=%s max_size_mb=%s min_duration_s=%s max_duration_s=%s "
C:\Users\avidu\Projects\wt-pr58\src\tg_video_filter\manager.py:73:
log.info("manager_started sessions=%d db=%s", len(pairs), settings.db_path)
C:\Users\avidu\Projects\wt-pr58\src\tg_video_filter\manager.py:177:
log.info("client_connected account=%s", session.account_id)
C:\Users\avidu\Projects\wt-pr58\src\tg_video_filter\manager.py:181:
log.info("client_disconnected account=%s", session.account_id)
C:\Users\avidu\Projects\wt-pr58\src\tg_video_filter\backfill.py:284:
"backfill_video_seen user=%s channel=%s msg=%s matched=%s reasons=%s",
C:\Users\avidu\Projects\wt-pr58\src\tg_video_filter\delivery.py:159:
log.info("video_forwarded video=%s target=%s", video_id, target)
C:\Users\avidu\Projects\wt-pr58\src\tg_video_filter\telethon_client.py:335:
"video_seen user=%s channel=%s msg=%s matched=%s reasons=%s",
```

12. assistant (2026-07-07T03:37:39.693Z)

All other listed events grep-match in the source. Only `delivery\_record\_failed` returns no matches. The finding is confirmed: the line ships in this PR diff (added at `+-delivery\_record\_failed`), and no such log token exists in `src/tg\_video\_filter`. The real delivery-failure events are `link\_delivery\_failed\_in\_both\_mode` and `forward\_delivery\_failed\_in\_both\_mode` (delivery.py:266,268), plus `link\_mode\_fallback\_to\_forward` (delivery.py:273) and `flood\_wait`.

Severity assessment: this is a doc list of grep-able log tokens for observability. An operator

building alerting on `delivery\_record\_failed` would silently never match, but it's a passive documentation inaccuracy, not a wrong command/flag/deploy step a user would execute and be immediately broken by. It's misleading/stale but low-impact ? the finding's `low` severity is appropriate.
